Hedges were in use among the ancient Romans, chiefly for the enclosure of vineyards and gardens. It is probable that they have existed in England since the times of the Romans, although not very common till the end of the 17th c.; but they are supposed to have been first introduced into Scotland and Ireland by the officers of Cromwell's armies. The first hedges planted in Scotland are said to have been at Inch Buckling Brae, in East Lothian, and at the head of Loch Tay, and that at the former place existed as a row of old hawthorns in the beginning of the present century.—(Loudon.)

HEDGEbote, in English Law, means the right of a tenant to cut wood on the farm or land, to repair the hedges or fences.

HEDGEHOG (*Erinaceus*), a genus of insectivorous quadrupeds, the type of the family *Erinaceidae*. The muzzle is rather elongated, the neck short, the limbs short, the feet five-toed, the claws strong, the tail short, the body covered on the upper parts with sharp spines, and with hair below, and capable of being rolled up into a ball by means of a powerful muscle extended under the skin. The teeth are 36 in number, 20 in the upper jaw, and 16 in the lower, but considerable difference of opinion has existed among naturalists as to the character of some of them. The middle incisors are very long, and stand forward; those of the upper jaw are widely separated; the lateral ones small. Like many other *Insectivora*, hedgehogs are by no means limited to insect food, but prey on larger animals, as reptiles, small quadrupeds, and birds; they are fond of eggs and of milk, and in confinement will readily eat soaked bread, cooked vegetables, or porridge. Their power of rolling themselves into a ball, from which the spines

Hedgehog (*Erinaceus Europæus*).

project on every side, is their means of protection from enemies. The spines are curiously bent near the root, and so set, that on the contraction of the muscle by which the animal rolls itself up, they are held firmly in their position, their points towards the adversary. They are very strong and sharp; their elasticity is also so very great, that the animal can sustain falls from great heights without apparent injury.

The Common H. (*E. Europæus*) is a native of Britain and of most parts of Europe. A particular description is unnecessary. Its short ears are one of its distinctive specific characters. It is seldom above 9½ inches in length. Its spines are about an inch long. It readily kills snakes, and even

vipers, which it eats, beginning always at the tail. It is said to be capable of resisting in an extraordinary degree not only the venom of serpents, but other kinds of poison, however administered. A H. has been known to eat great numbers of cantharides (Spanish flies) without injury, although one would have caused great agony to a dog. It brings forth from two to four young at a birth, and provides for the occasion a curiously constructed nest, of which the roof is capable of throwing off the rain, so as to keep them dry. The young are blind at first; their ears are also closed—a thing as unusual as the former is common among animals—their bodies are covered with soft incipient spines. In winter, the H. becomes torpid, retiring to some hole at the base of a tree, beneath roots, or in some such situation. It provides no winter store, and no other British animal hibernates so completely.—The H. is easily tamed, becomes very familiar, and is very useful in houses where *black beetles* are troublesome. Night is its period of activity.—The flesh of the H. is eaten in some parts of Europe, but in Britain only by gypsies, who roll it up in a ball of clay, and so roast it.—Other species of H. are found in different parts of Asia and Africa.

HEDGE-MUSTARD (*Sisymbrium*), a genus of plants of the natural order *Cruciferae*, mostly annual or perennial herbaceous plants, with very various foliage, small yellow or white flowers, and a long roundish or 6-angled pod (silique). Several species are natives of Britain, of which one, the **COMMON H.** (*S. officinale*), was once employed in medicine for catarrhs and other ailments. It is said to be diaphoretic and expectorant. It has a mild pungency. It is sometimes cultivated as a pot-herb. It is an annual plant, plentiful in waste places and by waysides, sometimes two feet high, branched, with run-cinate or deeply lobed leaves, stem and leaves hairy, flowers very small and yellow. The pods are erect, and closely pressed to the stalk.—**BROAD-LEAVED H.**, or **LONDON ROCKET** (*S. irio*), is said to have sprung up in great abundance on the ground desolated by the fire of London in 1666.—**FINE-LEAVED H.**, or **FLIX-WEED** (*S. Sophia*), is common in many parts of England and Scotland, growing in waste places. Its leaves are doubly or trebly pinnatifid. It is about two feet high, branched, with yellow flowers. It was formerly administered in dysentery and hysteria, and the seeds as a vermifuge.

HEDGE-SPARROW, HEDGE-WARBLED, HEDGE-ACCENTOR, or DUNNOCK (*Accentor modularis*), a little bird of the family *Sylviade*, a

Alpine Accentor (Accentor Alpinus).

common native of Britain and of most parts of Europe. It is not quite so large as the house-sparrow, which it somewhat resembles in dull brownish plumage, but notwithstanding its most common

name, in little else; its slenderness of bill, and its whole form, proclaiming it at once to be of a different family. It feeds principally on insects. It is one of the earliest spring songsters, having a sweet plaintive song; and the nest is one of the first that the school-boy finds in spring. The nest, of green moss, roots, and wool, lined with hair, is usually placed rather low in a bush or hedge. The eggs are four or five in number, of a delicate and spotless bluish green. The cuckoo very often lays its egg in the hedge-sparrow's nest. The hedge-sparrow is chiefly found in summer, in the northern temperate parts of Europe, migrating southward in winter; but in Britain it remains all the year.—Another species of the same genus, the **ALPINE WARBLER, or ALPINE ACCENTOR** (*A. Alpinus*), a rather larger bird, lighter and rather more varied in colour, has in a few instances been found in Britain. It is common in the Alps, and other mountains of France, Germany, and Italy.—Other species of Accentor are found both in the Old and New World. They are all of dull plumage. In this genus the bill is more conical than in the other *Sylviade*.

HEDJA'Z (the land of pilgrimage), a maritime province of Arabia, extending along the eastern shore of the Red Sea, and bounded on the N. by the Syrian desert and the Gulf of Akaba, on the E. by the province of Nedjed, and on the S. by that of Yemen. It is almost entirely unproductive, being chiefly sandy or stony. Containing the two sacred cities, Mecca and Medina—the former the birthplace of Mohammed, the latter the place in which he is interred—H. is the 'Holy Land' of Arabia. It is traversed annually by vast numbers of pilgrims.

HEDDJRAH (*Hegirah*), or, more fully, **HEDJRAH AL-NABI**, Arab. Emigration (not *flight*, as commonly translated) of Mohammed (q. v.). The tribe of the Koreish having resolved to slay the new prophet, their kinsman, he secretly left Mecca on the 13th of September 622 A.D., and repaired to Medina, where, partly from a feeling of jealousy towards Mecca, partly because his new doctrine had already found here many new adherents, he was so well received and so vigorously supported in the wars which he now began to wage against his adversaries, that the rise and progress of Mohammedanism was said to date in reality from the time of Mohammed's leaving Mecca. The Hedjrah, therefore, was made the starting-point of a new era—the Mohammedan (*Tarikh Alhijrah*)—by Calif Omar, who, in 639 or 640, with the aid of a Persian, Harmozan, instituted the new Moslem calendar. It does not, however, as is generally supposed, begin from the day of the flight itself, but from the first of the Moharrem (the first month of the year) preceding it—a date corresponding to our 15th or 16th of July 622 A. D.

The Mohammedan year, as a lunar year, is shorter than ours by 10 days, 21 hours, and 14½ seconds; and this circumstance renders the exact transfer of Mohammedan dates into dates of our own calendar a very difficult task. An elaborate method has been invented for that purpose by Ideler; an easy, although not minutely accurate way of finding the year, but not the month and the day, is by the deduction of 3 per cent. from the given Mohammedan year, and the addition of 622 to the sum so obtained; e. g., the present year of the Hedjrah being 1279, deduct 3 per cent., or about 39 = 1240, add 622 = 1862.

HEEM, JAN DAVID DE, the most celebrated painter of what is called 'still-life' that the Dutch school has produced, was born at Utrecht in 1600, studied under his father, and soon obtained

immense sums for his pictures. Towards the close of his life, he removed to Antwerp, where he died in 1674. H.'s pictures represent, for the most part, splendid vases of fruits and flowers, musical instruments, and ornaments of various kinds. He painted a garland of flowers for a certain Jan Vander Meer, who refused 2000 guilders for it, but afterwards gave it to the Prince of Orange, who brought it with him to England. H.'s colouring is exquisite, and his use of *chiaroscuro* unsurpassable.

HEEN, CHOW, TING, AND FOO, Chinese geographical terms, used to designate the relative rank of cities and districts. *Heen* indicates the smallest division, although its city may be an important one; thus, Shanghai-heen is a large city and district, while the department in which it is situated, Sungkiang-foo, to which it is subordinate, is a smaller place. Generally speaking, however, the terms designate the rank of cities, from *foo*, the chief, to *heen*, the least in size.

HEEREN, ARNOLD HERMANN LUDWIG, an eminent German scholar, was born 25th October 1760, at Arbergen, near Bremen, where his father was at that time pastor, and received his education at the cathedral school of Bremen, and at the university of Göttingen. He first made himself known to the literary world by two philological works—viz., an edition of Menander's *De Encomiis* (Göttingen, 1785), and the *Eclogæ Physicæ et Ethicæ* of Stobæus (4 vols. Göttingen, 1792—1801). In preparing materials for the latter of these works, he visited Italy, the Netherlands, and France, and by intercourse with various learned men of these countries, expanded and enriched his mind. In 1794, he was appointed Professor of Philosophy, and in 1801, Professor of History at Göttingen. He married in 1797 a daughter of Heyne, and died 7th March 1842. His lectures in the university referred, from the very first, more to Greek and Roman antiquities, and to the history of the fine arts, than to philology, strictly so-called. The latter, indeed, was finally quite thrown into the background. In 1793—1796, appeared at Göttingen his *Ideen über Politik, den Verkehr und den Handel der vornehmsten Völker der alten Welt* (4th edit. 5 vols. 1824—1826). This work has secured him a place among the most eminent modern historians. If his *Geschichte des Studiums der classischen Literatur seit dem Wiederaufleben der Wissenschaften* (2 vols. Gött. 1797—1802) proved less satisfactory to scholars, his *Geschichte der Staaten des Alterthums* (Gött. 1799; 5th edit. 1826), and his *Geschichte des Europ. Staatensystems und seiner Colonien* (Gött. 1809; 4th edit. 1822) abounded in new views and acute expositions. For his *Untersuchungen über die Kreuzzüge*, he received the prize from the National Institute of France. His *Kleine historische Schriften* (3 vols. Gött. 1803—1808) contain some very interesting treatises. In 1821—1826, he published an edition of all his historical works (*Historischen Werke*) in 15 vols. H. was a member of the academies of St Petersburg, Berlin, Munich, Stockholm, Dublin, and Copenhagen, and of the Asiatic Societies of London and Calcutta.

HEGEL, GEORG WILHELM FRIEDRICH, one of the greatest German philosophers, was born 27th August 1770, at Stuttgart, and became, in 1788, a student in the Tübingen theological institute, where his speculative abilities, however, were outshone by his younger companion, Schelling. After leaving the university in 1793, he was a family tutor at Bern and Frankfurt-on-the-Maine for six years, during which period he devoted himself chiefly to the study of Christ's life and the philosophy of

religion. In the beginning of 1801, he left Frankfurt for Jena, where he published his first work, *Ueber d. Differenz d. Fichte'schen u. Schelling'schen Systems* (1801), and entered the university as *Privat-docent*. Next year, he joined Schelling, to whose philosophy he seems at this time to have adhered, in the editorship of *Das Kritische Journal für Philosophie*. His lectures in Jena did not attract much notice, but it was at this place, while the din of the battle in 1806 was sounding through the town, that he completed his first important work, *Die Phänomenologie d. Geistes* (1807), which he used afterwards to call his voyage of discovery. Shortly before the battle, he had been made extraordinary professor of philosophy; but the disaster which that event brought upon Jena compelled him to seek means of subsistence elsewhere, and he went, accordingly, at Niethammer's request, to Bamberg, where he edited a political paper for two years. In 1808, he was appointed rector of the gymnasium at Nuremberg, and there he had just completed his *Wissenschaft d. Logik* (3 Bde. 1812—1816), when he was called in 1816 to a professorship of philosophy in Heidelberg, where he published his *Encyclopädie d. philosophischen Wissenschaften* (1817; 3te Aufl. 1830), in which he first developed his complete system. In 1818, however, he was called to Fichte's place in Berlin, and it was here that he first began to gather around him a new philosophical school. His lectures, which were delivered in a stammering voice, and without rhetorical ornament, yet with the impressiveness of being the expression of laborious thought, attracted hearers from all ranks and professions. He rose to considerable political influence through his official connection with the Prussian government, and his philosophy in some respects lost credit from the generally conservative tendencies of his administration. Still, in his *Rechtsphilosophie* (1821), he demands representation of the people, freedom of the press, publicity of judicial proceedings, trial by jury, and the administrative independence of corporations. In the midst of an active life, he was suddenly cut off by cholera, 14th November 1831, and buried beside Fichte. A complete collection of his works was published in 18 vols. (Berlin, 1832—1841), and his life written by Rosenkranz (1844).

At first, as has been intimated, H.'s philosophy started from the same position as Schelling's—the principle of the identity of knowing and being; but at an early period he departed from Schelling's theory, that this identity can be apprehended only through an intellectual intuition, of which the understanding can render no account. Carrying out rigorously the principle from which both started, as embodied in the proposition of Spinoza, that the order and connection of thoughts are the same as the order and connection of things, H. sought to find the universal form which characterises the process both of existence and thought. This universal form he recognised as the process of becoming (*Werden*). But the process of becoming is only the union of position and negation; for all that becomes at once posits, and, by passing into something else, removes itself. Identical with this process is the process of thought; for every thought involves its contradictory. But the contradictory is not a mere negation; it is in itself positive; the conception of unity, e.g., is not more positive than its contradictory, the conception of plurality. Every thought therefore, as it involves its contradictory, adds to its own contents, and by the combination of the two contradictories, we rise to absolute knowledge. This process, involving in it the three stages of position, negation, and the union of both, determines

the method of H.; for according to this method, his entire system is organically necessitated in all its parts to a threefold division corresponding to the three stages in the process of thought and existence. The point from which all knowledge must start is thought simply and in itself, the science of which, logic, forms, therefore, the first part of this system. But thought passes into something other than itself, exists out of itself in nature, and the philosophy of nature accordingly ranks as the second part. Returning again from its estrangement in nature, thought becomes conscious of itself in mind, and consequently the philosophy of mind forms the third part. It would be profitless to give a mere enumeration—and nothing more could be attempted here—of the various subdivisions, in their degrees of subordination, into which these three grand divisions are separated. For an account of the system, consult, besides the ordinary histories of philosophy, Vera's *Introduction à la Philosophie de Hegel* (Paris, 1855), and Haym's *Hegel u. seine Zeit. Vorlesungen über Entstehung u. Entwicklung, Wesen u. Werth d. Hegelschen Philosophie* (Berlin, 1858).

Hegelianism is commonly employed to denote the direction of philosophical speculation in the large school which arose under the influence of Hegel. During H.'s life, and on till 1841, when Schelling came to Berlin, Hegelianism found a very efficient organ in the *Jahrbücher für wissenschaftliche Kritik* (1827—1847, ed. by Henning); and through the influence of the Prussian minister, Von Altenstein, a large number of the philosophical chairs in the Prussian universities were secured for Hegelian professors. In the second grand department into which H. had divided his system, the philosophy of nature, his speculations did not give the same impetus to inquiry as those of Schelling had given; but this may be accounted for from the consideration that the enthusiasm for physical investigations, which was rising when Schelling's early speculations appeared, had reached its culmination before H. began to attract notice. In logic, also, owing to H.'s own exhaustive treatment, little has been done by his disciples, except in the way of explication and apology, of which Schaller's, Erdmann's, and Hinrichs' works on the science are specimens. But in psychology we find developments of the Hegelian principles by Rosenkranz, Michelet, and Erdmann; in jurisprudence, by Gans; in ethics, by Michelet; in aesthetics, by Vischer, Hinrichs, Hotho, Rosenkranz, Ruge, and Schnaase; in the history of philosophy, notwithstanding H.'s own work, by Erdmann, Michelet, Rosenkranz, Schwegler, Zeller, &c. In the philosophy of religion, however, Hegelian speculation has been more widely and powerfully influential than in any other department; Daub, Marheineke, Rosenkranz, Conradi, Göschel, Vatke, and a host of other more or less known writers, joining with H. in seeking to elicit the eternal meaning embodied in the historical and symbolical forms of Christianity. But as soon as Hegelianism reached this sphere of speculation, it began to shew antagonistic tendencies. These became especially apparent four years after H.'s death, in the controversy raised by Strauss' *Leben Jesu* (1835), and continued by his *Christliche Glaubenslehre* (1840). The Hegelians then split into three sections, called severally the right, left, and centre, according as they represent supernaturalism, rationalism, or a mediating mysticism. Among those of the extreme left, known also as the *Young Hegelians*, and dubbed by Leo with the felicitous but untranslatable diminutive *Hegelings*, the Hegelian philosophy, which had before been ecclesiastically and politically conservative, became thoroughly radical. In 1838,

Ruge began to edit for them a special organ, *Die Halleschen Jahrbücher*, which was very influential among the youth of Germany, but was prohibited in 1847, after having been transferred to Leipsic under the title of *Die Deutschen Jahrbücher*. Weisse, Fichte (the younger), Ulrici, Fischer, and Carriere, are considered pseudo-Hegelians, because, though retaining the terminology and general principles of Hegelianism, they introduce at times an extraneous method and results. Beyond Germany, Hegelianism is represented in France by Vera, in Denmark by Heiberg, and in Sweden by Snellmann, Tengström, Bring, and others, and has not failed to exert an important influence on British and American thought.

HEGESIPPUS, the earliest of the Christian Church historians. He was born of a Jewish family in Palestine about the beginning of the 2d c., but became a Christian at an early age, and was a member of the Church of Jerusalem. He went to Rome in the pontificate of Anicetus, visiting upon his journey many churches, and especially that of Corinth, where Primus was bishop. He remained in Rome till the death of Soter (176), and is supposed to have died in the year 180. It was during his sojourn in Rome that he composed his history, in five books, entitled *Memorials of Ecclesiastical Affairs*, which, however, appear not to have formed a complete and continuous history, although they extend from the death of Christ down to the writer's own age. Unhappily, the work, as a whole, has perished, and we know it only from some fragments which Eusebius has embodied in his own *History*, and the most important of which are his account of the martyrdom of St James and also of St Simeon of Jerusalem. Eusebius speaks highly of the doctrinal fidelity of H., and St Jerome, of the simplicity and purity of his style. Another work on the Wars of the Jews (also in five books), ascribed to H., is confessedly spurious. The most complete collection of the fragments of his writings is that of Gallandus in the second volume of his great collection. See also Grabe, *Spicilegium*, tom. ii.; and Fabricius, *Bibl. Græca*, vii. 156.

HEGIRA. See HEDJRAH.

HEIDÉ, a small town in the duchy of Holstein, is situated in Northern Ditmarsh, 32 miles north-west of Gluckstadt. It is a pleasant, well-built town, with a large market-place. The inhabitants are employed chiefly in agriculture and general trade. Pop. 6120.

HEIDELBERG, an ancient city of Germany, in the grand duchy of Baden, is situated on the left bank of the river Neckar, in one of the most beautiful districts in the country, on a narrow strip of ground between the river on the north, and the northern extremity of the Geisberg Mountains on the south. It is 13 miles south-east of Mannheim, and about 54 miles south of Frankfurt-on-the-Maine. The town consists mainly of one street about three miles in length. Among its most important buildings are the Church of the Holy Ghost, through which a partition-wall has been run, and in which service according to the Catholic and Protestant rituals is simultaneously carried on; the Church of St Peter's, on the door of which Jerome of Prague, the companion of Huss, nailed his celebrated *theses*, at the same time publicly expounding his doctrines before a multitude assembled in the churchyard; and the ruins of the castle, which was formerly the residence of the Electors Palatine, and which, in 1764, was set on fire by lightning, and totally consumed. In the cellar under the castle is the famous Heidelberg Tun, 36 feet long and 24 feet high, and capable

of containing 800 hhds. H. is celebrated for its university, which, after those of Prague and Vienna, is the oldest in Germany. It was founded by the Elector Ruprecht I. in 1386, and continued to flourish until the period of the Thirty Years' War, when it began to decline. In 1802, however, when the town, with the surrounding territory, was assigned to the Grand Duke of Baden, a new era commenced for the university, and it rapidly became famous. It comprises faculties of theology, law, medicine, and philosophy. In 1858, it had 84 professors and teachers, and 560 students. Its library, to which additions are always being made, consisted in the same year of 150,000 volumes and 3000 manuscripts. As an edifice, it is a plain, and not very large building, near the centre of the town. The Library, the Anatomical and Zoological Museums, and the Museum Club, are separate buildings. Connected with the university are numerous scientific collections, a chemical laboratory, a botanic garden, &c. The trade and manufactures of the town are inconsiderable. The cheapness of living, however, and the beauty of the environs, which are cultivated like a garden, have caused a great many foreigners to settle here. Pop. 17,666.

As the residence of the rulers of the Palatinate, H. underwent all the vicissitudes of that much-suffering electorate. See PALATINATE.

HEIGHTS, MEASUREMENT OF, may be performed in any one of four ways: by the aid of trigonometry; by levelling; by ascertaining the atmospheric pressure at the top and bottom of the height by the barometer; or by ascertaining the boiling-point of water at the top and bottom by the thermometer. As the second and third methods are treated of elsewhere (see **LEVELLING** and **BAROMETER**), the first and fourth alone are here considered. The first method is often more convenient than any of the others, as it does not require the ascent of the height, nor even a near approach to it. There are two cases of the problem:—Case 1 (when there is level ground in front). Let ACD be a height of irregular form, take O and M, two stations on the level ground in front, find the angles AOB,

observer's station—be required, then the height or depression of the first, and the height or depression of the other above or below the observer's station,

Fig. 2.

must be found separately as before, then the difference (if both are above or both below the observer's level) or sum (if one is below it) of these results gives the number required. For instance (fig. 1), the height of A or AB is first found, CE or the height of E is next calculated, and their difference, AB—CE, or AF, is the height of A above E.

Besides this rigorous trigonometrical method, there are many ways of estimating pretty nearly the height of objects, with little or no calculation. For instance, if the height is perpendicular, and the ground in front on a level with the base, take two pieces of wood, hinged or jointed together at an angle of 45°, or a large pair of compasses opened to that angle; place one leg horizontal and directed to the base of the object, and move the instrument towards it, or from it, until the other leg point to the top; then the distance of the angle from the bottom gives the height.

The fourth method is often used in measuring the height of mountains when great accuracy is not required, or when the apparatus requisite in applying the other methods is not at hand; all the apparatus required in this method being two thermometers, a tin pot to boil the water, and a book of tables such as those given by Colonel Sykes in *Hints to Travellers*. The method depends upon the fact, that vapour of water or steam has a certain tension or elastic force according to its temperature, thus: at 32° it can support 0.2 of an inch of mercury; at 80° it can support 1 inch; at 150°, 7.42 inches; at 180°, 15.5 inches; at 212° (the ordinary boiling-point), 30 inches, or the whole pressure of the air. By observing, therefore, the temperature at which water boils, we can find, by means of a table of the elastic force of vapour at different temperatures, the pressure, in inches of mercury, to which it is subject at the time. Now, beginning at the level of the sea, it is found by experiment that a fall of 1° in the boiling-point corresponds to an elevation of 510 feet; at an elevation of 2500 feet, the difference for a degree is 520 feet; at 5000, it is 530 feet; at 17,000, it is 590 feet. An approximation for medium elevations may be made by taking 530 feet on an average for the difference corresponding to 1°, then 530 multiplied by the number of degrees between the boiling-point and 212° will give, approximately, the height.

HEIJN, or **HEYN**, PETER PETERSEN, a famous Dutch admiral, was born in 1577, at Delftshaven, near Rotterdam. Of low origin, he gradually advanced himself by his bravery to the highest dignities. As vice-admiral of the fleet of the Dutch West India Company, he in 1626 engaged and

Fig. 1.

AMB, and measure OM; then as AOM, AMO (which is AMB subtracted from 180°), and OM are known, AO can be found; and since now AO and the angle AOM are known, AB can be found. If the height is regular in form, all that is necessary to be done is to measure OC, calculate CB, find AOB; then AB can at once be calculated by the ordinary rules.—Case 2 (when there is no level ground in front). Suppose the height of A above O (fig. 2) is to be found. Take another station M, from which A and O are visible, measure the angles AOM, OMA, and find OM by Levelling (q. v.), then OA can be found; at O take the angle AOB (the angular altitude of A), then from OA and AOB, AB can be known. If the height of one point above another—the latter not being the

utterly defeated the Spaniards in All Saints' Bay, captured 45 of their ships, and returned to Holland with an immense booty. In consequence of this splendid victory, the Company raised him to the rank of admiral. Only two years after this, he captured, almost without requiring to strike a blow, the grand Spanish silver flotilla, the value of which was estimated at 12,000,000 Dutch guilders. As a reward of this unparalleled success, he was, in 1629, named Admiral of Holland. Shortly after, he met his death in a fight with two ships off Dunkerque. A marble monument is erected to his memory in the old church at Delft.

HEILBRONN (formerly, *Heilighbronn, holy well*), an important trading and manufacturing town of the kingdom of Württemberg, in the circle of Neckar, is situated on the right bank of the river Neckar, in a beautiful and fertile valley, 28 miles north of Stuttgart. The church of St Kilian, built from 1013 to 1529, a noble edifice, partly Gothic and partly Renaissance; the old town-hall, *der Diebsturm*—the Thief's Tower—in which Götz von Berlichingen was confined; and the house of the Teutonic knights, now a barrack, are the chief buildings. Though wine and field and garden produce are still cultivated by many of the inhabitants, trade and manufactures are the chief branches of industry now carried on here. Paper, chemical products, silk, dye-stuffs, gold, silver, and iron wares, tobacco, vinegar, &c., are manufactured for export. Gypsum and sandstone are quarried in the vicinity. Pop. 14,029.

HEILIGENSTADT, a regularly built and walled town of Prussian Saxony, is situated on the Leine, near the Hanoverian frontier, 50 miles north-west of Erfurt. It was the capital of the department of the Harz, in the kingdom of Westphalia, from 1807 to 1814. Weaving, dyeing, and paper-manufacture are carried on. Pop. 5000.

HEILSBERG, a small town of Prussia, in the province of East Prussia, is very beautifully situated on the Alle, 43 miles south of Königsberg. It was originally the chief town of Ermeland, one of the old divisions of Poland. Pop. 5000, who manufacture cloth, leather, &c.

HEILSBRONN, a small town in the Bavarian circle of Middle Franconia (pop. 900), worthy of note as the ancient burial-place of the Hohenzollern Burggrafs of Nürnberg. The convent of Heilsbronn owes its origin in 1132 to Bishop Otho of Bamberg, and its subsequent rich endowment to the Counts of Ahenberg, from whom it passed in heritage to the Nürnberg princes, who thenceforward retained the lay-proprietorship of the institution. Nearly all the members of their House were buried here till the end of the 15th c., when it became the burial-place of the Franconian branch of the Hohenzollerns, till their surrender of their Franconian hereditary lands. Since the suppression of the monasteries in 1555, little has been done to keep up the splendour of H.; but the church still retains a large number of highly interesting monuments, at once commemorative of ancient German history, and illustrative of the progress of art in Germany during the middle ages. The village of Heilsbronn, which lies on the Schwabach, possesses mineral springs, and has manufactories of wax-cloth and woollen goods. The history and antiquities of Heilsbronn convent have been made the subject of several interesting treatises, of which the most complete is Hocker's *Heilsbronnisches Antiquitätenschatz*, and Stillfried's sequel to the same work.

HEIMSKRINGLA. See SNORRI STURLESON.

HEINE, **HEINRICH**, a modern German poet

and wit, was born at Düsseldorf, of Jewish parents; the date of his birth is variously stated as 1797, 1799, and (by himself) 1800. In 1819, he proceeded to the university of Bonn for the purpose of studying law; but he devoted himself with greater ardour to the study of modern and ancient German literature, under the auspices of his master and friend August Wilhelm Schlegel. He subsequently studied at Berlin and at Göttingen, at which latter place he took his degree as Doctor of Law in 1825. About this time, he abandoned Judaism, and was baptized in the Lutheran Church of Heiligenstadt. A visit to the Hartz and to Italy supplied him with materials for his *Reisebilder* (Pictures of Travel, Hamb. 4 vols. 1826–1831). This book obtained, on its first appearance, an extraordinarily brilliant success. 'Young Germany,' in particular, became drunk with enthusiasm. His *Buch der Lieder* (Book of Songs, Hamb. 1827; 10th edit. 1852)—a portion of which had first appeared as *Youthful Sorrows* in Berlin, 1822—was no less fortunate. Many of these songs are of the most exquisite and ethereal beauty. They are unmatched in German literature, except by the lyrics which Goethe wrote in his youth. The revolution of July threw H. into a violent fit of democracy, and in 1831 appeared his *Kahldorf über den Adel, in Briefen an der Grafen M. von Moltke* (Kahldorf on the Aristocracy, in Letters addressed to Count M. von Moltke). He now found it advisable to leave Germany, and at once proceeded to Paris, where he resided for the rest of his life, cultivating belles-lettres, both with a brilliancy and a malice hitherto almost unheard of. In 1835, he married a certain 'Mathilde,' who figures much in his writings, and in 1843–1844 visited his native country, to see his mother. On his return, he published *Deutschland; ein Wintermärchen* (Germany; a Winter's Tale), in which he recounts imaginary adventures and burlesque episodes, and in which a great number of his countrymen, kings, statesmen, professors, authors, artists, &c., are mercilessly satirised and abused. In 1847, H. was attacked by disease of the spine, and was almost constantly bedridden. He suffered the most acute pain, together with the loss of eyesight, with the most remarkable equanimity and even good-humour, till the day of his death, which took place at Paris, February 17, 1856. His will expressed a desire that no religious ceremonies should be celebrated at his funeral. 'This,' however, he adds, 'is not the weak fancy of a free-thinker. For the last four years, I have cast aside all philosophical pride, and have again felt the power of religious truth.' What faith is to be placed in this assertion, may easily be concluded from his subsequently designating the Deity as the 'mighty Aristophanes of Heaven,' who laughs at his calamities. Besides the works already mentioned, H. wrote *Französische Zustände, Der Salon, Shakspeare's Mädchen und Frauen, Neue Gedichte, Atta Troll, Romanzero*, &c. A complete edition of his works was published at Philadelphia, by John Weik, in 1856; another is in the course of publication, by Hoffmann Campe, in Hamburg. A French edition of his works (Michel Levy, Paris) has been prepared, with his co-operation, by Loewe-Weimars, Gerard de Nerval, and St René-Tailandier. English versions of some of these are Leland's translation of *The Pictures of Travel* (Philad. 1856), *The Book of Songs*, by J. E. Wallis (Lond. 1856), and the *Poems of Heine*, complete, translated in the original metres by Edgar Alfred Bowring (Lond. 1859).

HEINECCIUS, **JOHANN GOTTLIEB**, a learned jurist of Germany, born 11th September 1681 at

Eisenberg, studied theology at Leipsic, and law at Halle, where in 1713 he was made professor of philosophy, and in 1720 professor of law. In the latter capacity, he went in 1723 to Franeker, in 1727 to Frankfurt-on-the-Oder; but in 1733 returned, as professor of law and philosophy, to Halle, where he died 31st August 1741. His works display a thorough acquaintance with all the departments of jurisprudence, but especially with Roman and German law; and their varied learning, logical arrangement, and elegant Latin, long maintained for them a classical character. His *Antiquitatum Jus Romanum Illustrantium Syntagma*, has been re-edited so lately as 1841 by Mühlenbruch, and his *Elementa Juris Civilis secundum Ordinem Institutionum* (edited by Biener, 1815); his *Elementa Juris Civilis secundum Ordinem Pandectarum*, &c., are still studied by jurists.—H.'s son, JOHANN CHRISTIAN GOTTLIEB H., born 1718 at Halle, died 1791 at Sagan, was for a long time professor in the academy for young noblemen at Liegnitz, and edited besides several of his father's works separately, a complete collection of them (*H. Opera Omnia*, 9 vols. Geneva, 1771).—H.'s brother, JOHANN MICHAELIS H., born at Eisenberg 1674, died 11th September 1722, was a celebrated pulpit orator in Halle, and also the first who studied seals scientifically. His theological writings are forgotten, but he is remembered by his *De Veteribus Germanorum aliarumque Nationum Sigillis* (Leip. 1710; 2d edit. 1719), and by the work edited in conjunction with Leuckfeld, *Scriptores Rerum Germanicarum* (Frankf. 1707).

HEIR, or HEIR-AT-LAW, in English Law, means the person who, in the event of no will being left by a deceased person which indicates a different person, is entitled by law to succeed to the real estate of such deceased person. The term is never used in the loose sense which prevails in Scotland, as including both heirs, properly so called, and executors or next of kin. When a person in England or Ireland does not think fit to exercise the undoubted right which belongs to him of leaving his real property by will to whomsoever he pleases, to be enjoyed after his own death, the law steps in, and appoints such a person for him, and this person is the heir-at-law. The law, in selecting these heirs, proceeds on certain fixed rules of primogeniture and relationship, preferring males to females. The eldest son is preferred to all the rest of the family, and his descendants; then the next eldest son and his descendants; and so on to the youngest son, after whom the daughters succeed equally or all together, and are then called coparceners. After the descendants of the deceased person, who may be called A, are exhausted, then A's father succeeds; after whom follow A's eldest brother and descendants; then A's next eldest brother; and so on to the youngest brother; after failure of whom and his descendants, then all A's sisters by the full blood succeed equally as coparceners; then A's half-brother by the father's side, and descendants, &c.; then A's half-sisters by the father's side, all as coparceners; after whom succeed A's paternal uncles and aunts in a similar order. Where there are no heirs whose relationship can be traced to the deceased person, then the real estate goes to the crown.

The moment a person dies leaving real estate in England, such real estate vests at once in the heir-at-law, whoever that may be, without any ceremony or formality being required. The heir-at-law, however, takes the property subject to the debts of the deceased, and must pay off all these, provided there is no personal estate sufficient to pay them, but in no case can he be liable beyond the value of the estate itself. The heir, it is true, may be sued for

these debts in the first instance, by any of the creditors, but he may afterwards have the real estate exonerated, thereby shifting the liability to the personal estate. When the deceased had land which was subject to a mortgage debt, then that debt is a burden on the land, and must be borne by the heir; but the law was otherwise before 1854.

The law of succession in Ireland is entirely the same as in England. See SUCCESSION.

HEIR, in Scotch Law, is often used in a loose sense to denote the persons entitled to succeed to the heritable as well as to the movable estate. In Scotland, the same rule exists as in England, that if a person do not by deed *mortis causa* (which operates like an English will) dispose or convey his estate to some other person, the law points out who is to take such estate, and that person is the heir-at-law. The rules by which the heir to heritable estate in Scotland is pointed out differ considerably from the English rules. These rules are the same as to the descendants of the deceased person A. But after A's descendants are exhausted, differences begin, for then it is not the father, nor yet the eldest brother of A, but the next younger brother of A, who next succeeds; then the next younger again, until the youngest brother; after whom and his descendants comes A's next elder brother; and so on upwards to the eldest brother of all. In Paterson's *Compendium of English and Scotch Law*, the different order of succession in both countries is shewn in a map. There is also a difference in Scotland as regards heritable estate which has been purchased by a person (in which case it is called Conquest), and who dies leaving brothers both elder and younger: in such case, contrary to the general rule, the estate goes first to the next elder brother, after whose failure the estate goes according to the ordinary rules. In Scotland, when females succeed equally, they are called Heirs-Portioners (q. v.). In Scotland, though not in England, the mother never succeeds in any event, or any relatives, except brothers and sisters german, who trace through her.

There is also an important difference in Scotland as to the vesting of the heritable estate of a deceased person. At the death of the owner, his heritable estate does not immediately vest in the heir, but remains in an intermediate state, then called the *hereditas jacens*, and the person entitled to be the heir must be served heir, or make up his titles, and enter to the estate. Several relics of feudal barbarism still exist in Scotland on this subject, though they have been greatly reduced in complexity and expense of late years. The general rule also exists in Scotland, that the heir-at-law takes the estates subject to his ancestor's debts; indeed, he is *prima facie* liable for all the debts, though far exceeding the property left, provided such heir do not take certain precautions to escape this passive representation, as it is called, for the barbarous maxim prevails, *heres est eadem persona cum defuncto*. The steps to be taken to guard against liability in such cases are matters of detail not necessary to be described. Another important distinction exists in Scotland, viz., that an heir need not be born in lawful wedlock, as in England, but it is enough if the father marries the mother afterwards, and so legitimates him.

The word 'heir' is often distinguished into several kinds. Thus, an *heir by destination* is a person who is pointed out by a certain deed to succeed in a certain order. So is an *heir of provision*. An heir-at-law is also often called an *heir of line*, because he succeeds according to a certain line or order; and an *heir-general*, because he is the general representative of the ancestor, in contradistinction to an heir-special, who is pointed out by deed. An *heir of*

entail is the person who succeeds to an entailed estate by virtue of the deed of entail, which prescribes the order of succession. An *heir of conquest* means, as above stated, the heir of an ancestor who acquired the estate in question by purchase, and not by succession. See **SUCCESSION**.

HEIR AND EXECUTOR, a short phrase to denote that branch of the law in which a leading distinction is made between the two kinds of property left by a deceased person, viz., real and personal. All a man's property falls under one or other of these heads. If real, it goes to the heir-at-law; if personal, it goes to the executors or administrators, often called the personal representatives. In Scotland, the same leading distinction exists under the head of heritable and movable, but in Scotland some things are classed among heritable, which in England would not be classed among real property. Thus, in Scotland, a lease is heritable property, and goes to the heir-at-law, while in England it is personal, and goes to the executor or administrator. So annuities in England are personalty, and in Scotland are heritable subjects, and there are some other differences not easily to be explained popularly.

HEIR-APPARENT, in English Law, means the person who is certain to succeed if he outlive his ancestor; thus the eldest son is so, because no other person can ever come between and obtain precedence. In Scotland, the phrase is sometimes used also popularly in this sense, but the words 'apparent heir,' when used technically there, mean quite a different thing, viz., the person who, after his ancestor's death, is entitled to succeed, provided he make up his titles, but who has not yet actually done so. The apparent heir has a year to deliberate, called the *annus deliberandi*, whether he will enter upon the property, because the responsibility is so much greater in Scotland than in England.

HEIRESS means a female heir when there are no male heirs to succeed. Where there are several females, all sisters, who are in that case equally entitled, they are sometimes called co-heiresses, but more properly *coparceners* in England, and *heirs-portioners* in Scotland.

HEIRESS. In Heraldry, a lady is accounted an heiress if she has no brothers who leave issue. The husband of an heiress is entitled to bear her arms in an escutcheon of pretence, i. e., a small escutcheon in the centre of his paternal shield, and the children of an heiress may quarter her arms with their paternal coat. Neither practice is of very early introduction in heraldry. See **MARSHALLING OF ARMS**.

HEIR-FEMALE means the female heir connected through a female.

HEIRLOOM, in English Law, means certain chattels which go to the heir-at-law by special custom, and have already come through several descents. The chattels included are the best of everything, as pots, pans, tables, &c. But the right is obscure. The word is more frequently used now to designate some chattel which a testator has bequeathed to the person, whoever he may be, who is to take the real estate. In Scotland, a somewhat similar, but by no means identical phrase is used, viz., *heirship movables*, which is a wider right, and includes the best articles of furniture in the house of a person who left heritable property. The extent of this right is also not clearly settled.

HEIR-MALE means the male heir connected through a male.

HEIR-PRESUMPTIVE, in English Law, means the person who would succeed if the ancestor were

to die immediately, but who may ultimately be displaced if the ancestor live longer. Thus, an only daughter is the heir-presumptive until a son is born, who thereupon displaces her. In Scotland, though the phrase is also used popularly in this sense, yet in its technical sense it means the person who is certain to be heir if he outlive his ancestor. In short, a presumptive heir in Scotland would be called an heir-apparent in England.

HEIRS-PORTIONERS, in Scotch Law, mean either two or more females, being sisters, or sisters and the children, male and female; of deceased sisters, who are entitled to succeed to heritable estate. Thus, if A dies leaving three daughters, all three succeed equally if alive; or if some had already died leaving children, then the children represent the parent, and succeed to the parent's share along with the surviving sisters, all being called heirs-portioners. In such cases, the eldest heir-portioner is entitled to the mansion-house over and above her equal share of the rest. She alone also takes a peerage or dignity, if there is any in the family. In England, coparceners, though resembling heirs-portioners, have not identical rights. See Paterson's *Comp. of E. and S. Law*, s. 777.

HEIRSHIP MOVABLES. See **HEIRLOOM**.

HEL, the northern goddess of the dead, who dwelt beneath one of the three roots of the sacred ash Yggdrasil, was the daughter of the evil-hearted Loki (q. v.), by the giantess Angurboda. Hel, together with her brothers, the wolf Fenrir, and the serpent Jormundgand, was bred up in the giant's home of Jötunheim, where she remained, till at the request of the Æsir, or gods, the All-father sent for her and her brothers; when, knowing that by their origin these children must prove a great source of calamity, he resolved upon their destruction, and after casting the serpent into the deep ocean, which surrounds all lands, and where it has grown so large that it encircles the whole world, and bites its own tail, he hurled Hel into Nifheim (q. v.), over which he gave her authority, and in which she was to assign places to all who die of sickness and age. Her vast abode is surrounded by a high enclosure with massive gates. Her dwelling is *Eldinnir*, dark clouds; her dish, *Hungur*, hunger; her knife, *Sullt*, starvation; her servants, *Ganglæti*, slow-moving; her bed, *Kör*, sickness; and her curtains, *Bliklandaböl*, splendid misery. She is easily recognised by her fierce aspect, and her half-black, half flesh-coloured skin. Hel was inexorable, and would release no one who had once entered her domain. See **BALDER**.

After the introduction and diffusion of Christianity, the ideas personified in Hel gradually merged, among all the races of northern and German descent, in the local conception of a Hell, or dark abode of the dead. See Thorpe's *Northern Mythology*, Grimm's *Mythologie*.

HE'LDER, a thriving seaport and strongly fortified town in the province of Holland, Netherlands, stands on the *Marsdiep*, which unites the Zuider Zee and the German Ocean, and separates North Holland from Texel. It is 45 miles north-west of Amsterdam, with which it is connected by the Grand Ship Canal. See **AMSTERDAM**. H. is protected from the inroads of the sea by an enormous dyke, six miles in length, 40 feet broad at the top, on which there is a good road, and which presents to the sea a sloping side of 200 feet, inclined at an angle of 40°. This dyke is built entirely of huge blocks of Norwegian granite. Here alone, along the whole coast, is deep water found close to the shore, a fact accounted for by the rush or 'race' of the tide, the violence of

which is so great here that no sand is allowed to accumulate. Fort Kykduin is surmounted by a tower and light-house. In 1859, 536 vessels, of 134,912 tons, entered and cleared the port. Pop. upwards of 10,000.

HELEN, the daughter of Zeus and Leda, wife of Tyndareus, king of Sparta. According to the ancient legend, she was so exceedingly beautiful, that at the age of ten she was carried off by Theseus and Pirithous, but was recovered subsequently by her brothers, Castor and Pollux. Tyndareus afterwards engaged her suitors, who numbered about 30, by a solemn oath, to unite together to aid the husband whom H. should choose, in case of any attempts being again made to carry her off. In accordance with this oath, her husband, Menelaus, when she was afterwards carried off by Paris, son of Priam, king of Troy, summoned all the princes of Greece to avenge the injury he had sustained, and thus gave rise to the Trojan war. The stories concerning the fate of H. are inexhaustible. The ordinary legend states that after the death of Paris, she voluntarily married his brother Deiphobus, and that on the taking of Troy, in order to recover the favour of Menelaus, she betrayed Deiphobus into his hands. On the fall of Troy, she returned with Menelaus to Sparta; but after his death was driven from the country, and having gone to Rhodes, was there murdered by the queen of the island. By her husband Menelaus, she had one daughter, Hermione. Greek artists have represented her in their works as the prototype of female beauty, and she has frequently been celebrated by the tragedians in their dramatic works.

HELENA, the name of several female saints of the Catholic Church, the most celebrated of whom is the Empress Helena, wife of Constantius Chlorus, and mother of Constantine the Great. The place of her birth is a subject of controversy: according to one account, she was born in Bithynia; but the English Church historians commonly claim her as a native of Britain, to which opinion some probability is added from the fact, that her first-born son, Constantine, was born in that country. She became a Christian during the youth of Constantine, and it is thought not unlikely that her example and her teaching co-operated with public motives in determining Constantine to embrace the Christian religion. It was not, however, till after the defeat of Maxentius that H. formally received baptism. She was at this time far advanced in years; but she survived her baptism for a considerable time, and deserved the gratitude of the Christian community by her zeal for the advancement of religion, and her many acts of piety and munificence. Among the public events of her Christian life, recorded by Catholic historians, the most remarkable is the discovery (according to the belief of the time) of the cross of Our Lord (see **HOLY PLACES**). She died in the year 328, or, according to another account, in 326.—Two other royal or princely ladies of the same name are honoured as saints. The first, whose honours are confined to the Russian Church, was the wife of the Grand Duke Igor, and at her baptism in Constantinople (955), changed her original name, Olga, into Helena. She is held in the highest reputation for sanctity in the Russian Church. The other was a native of Skofde, in West Gothland, and lived in the 12th century.

HELENA, St., perhaps the best known of all the lonely islands in the world, is situated in the Atlantic, in lat. 15° 55' S., and long. 5° 44' W. Greatest length of the island, 10½ miles; breadth, 7 miles; area, 47 square miles. Pop. (1858) 5490. It is 850 miles from the nearest land, the island of

Ascension, and about a half more from the nearest point of the African continent. The island was discovered in 1502, on St Helena's Day (22d May), whence its name, by the Portuguese navigator Juan de Nova Castella. It afterwards became a Dutch possession, was ceded by Holland about the middle of the 17th c. to the English East India Company, and made over by them to the British crown in 1833. Its value consisted in its being a convenient halting-place on the homeward voyage from India—a value enhanced by the fact, that the Cape of Good Hope had, ten years previously, been colonised by the Dutch. On the outward voyage, however, it was not available for sailing-vessels, which, under the influence of the easterly trade-winds, could reach it at last only after overshooting it far both to the west and to the south; and this difficulty of access peculiarly fitted it to be the residence of Napoleon Bonaparte, who here lingered in hopeless captivity from 1815 to 1821. The nature of the coast, too, would render a hostile landing next to impracticable, presenting, as it does, either a naturally scarped face of cliffs ranging from 600 to 1200 feet high, or the mouths of ravines protected by forts and other military works. There is one good inlet, called James's Bay, possessing a fine harbour. Here is situated James's Town, the only place of any note in the island.

About 6000 acres—one-fifth of the entire surface—are available for cultivation, but not more than 500 are actually under cultivation; while uplands of volcanic origin, rising in Diana's Peak, in the centre of the island, to the height of 2700 feet, feed large numbers of goats. There are several plains, the largest of which is Longwood, where stands the house in which Napoleon lived. Supplies of provisions, properly so called, are mostly imported, more especially for the resident population.

HELENSBURGH, a rising town and favourite watering-place of Scotland, in the county of Dunbarton, is pleasantly situated on the right bank of the Firth of Clyde, opposite Greenock, from which it is four miles distant, and 23 miles west-north-west of Glasgow by railway. It was founded in 1777 by Sir James Colquhoun, and named after his wife Helen. In 1858, direct railway communication was opened up between H. and Dunbarton and Glasgow, and since that time the town has greatly increased. Pop. (1871) 5975; but in summer, the numbers are nearly doubled.

HELIALAC RISING (from Gr. *helios*, the sun). A star is said to rise heliacally when it rises just before the sun. When the sun approaches a star which is near the ecliptic, the star becomes for a season invisible—the heavens being too bright in the quarters of sunrise and sunset, at the times of its rising and setting, to allow it to be seen. But when the sun, progressing in its orbit, separates from the star, and the latter begins to rise first, it in time rises so much earlier than the sun, as just to be visible before daylight. It is then said to rise heliacally.

HELIAINTHUS. See **JERUSALEM ARTICHOKE**, and **SUNFLOWER**.

HELICIDÆ (Gr. *helix*, a spiral), a large family of gasteropodous molluscs, of the order *Pulmonata*, and of which Snails (q. v.) are familiar examples. The order is distinguished by having part of the mantle cavity formed into an air-sac or lung. The H. are land molluscs. They have a spiral shell, into which the body of the animal can be withdrawn. Most of the species pretty much resemble the common snails in their habits, feeding on vegetable substances of various kinds, and often proving troublesome to the farmer and gardener.

HELICON, a mountain, or rather a mountain-range in the south-west of the province of Boeotia, in Greece, may be regarded as a continuation of the range of Parnassus. It was celebrated by ancient poets as the favourite seat of the Muses. The loftiest summit (now called Paleovúvi) is about 5000 feet high. At the bottom of H. stood the village of Ascra, the residence of Hesiod, and the seat of the earliest school of poetry in Greece. In ascending the mountain from Ascra (now Pyrgáki), the traveller passes the famous fountain of Aganippe, the waters of which were fabled to bestow inspiration. The Grove of the Muses is supposed to have been situated in a hollow at the foot of Mount Mirandáki, one of the summits of Helicon. Leake considers that its site is now occupied by the church and convent of St Nicholas. Twenty stadia above this was the fountain of Hippocrene, probably the modern Makariotissa, where there is still a fine spring.

HE'LGOLAND, or **HELGOLAND** (Holy Land), a small island in the North Sea, belonging to Great Britain, is situated about 35 or 40 miles north-west of the mouth of the Elbe, in lat. 54° 11' N., and long. 7° 53' E. It is about a mile long from north to south, and one-third of a mile from east to west, one-fifth of a square mile in superficial area, and about 2½ miles in circumference. The island consists of an upper and a lower quarter; the former, 'The Oberland,' is a rock 200 feet in height, and 4200 paces in circumference, on which stands a town of 350 houses, and 2800 inhabitants; the latter, 'Sandy Island,' is a patch of shore with 60 houses south-east of the cliff, and communicating with it by a flight of 173 steps. The surging of the sea, which has already greatly diminished the size of the island, is fast consuming its shores, and will probably, at no great distance of time, reduce it to a mere sand-bank. H. has two good ports, one on its north, and another on its south side. The inhabitants are supported chiefly by fishing and commerce, by serving as pilots, and by the strangers who visit H. for the excellent sea-bathing Sandy Island affords. A light-house stands on the cliff near the village. There is also a prison, but it is never occupied. The annual value of the fisheries is about £5000, and the chief products are lobsters and haddocks. H. is an important place in time of war, and commands the German trade in the North Sea. The island, which was taken by the English from the Danes in 1807, and was formally ceded to them in 1814, has an English governor, but the internal affairs are managed by a council of the islanders. Four batteries, manned by a garrison of British soldiers, are mounted on the cliff. The British establishment maintained on H. costs about £1000 a year. Steam-boats run between this and Hamburg.—H. was anciently sacred to the goddess Hertha, and was the island to which the tribe of the Angli, who inhabited the mainland opposite, went to perform religious rites in her honour. On a map discovered by Sir William Gell, the situation of many temples, villages, and large tracts of country, are delineated, all of which were swallowed up by the sea, between 700 A.D. and 1200 A.D., according to D'Anville. The sea continued its encroachments, and, before the end of the 17th c., had submerged several churches and monastic establishments. Christianity was first preached here by St Willibrod in the 7th c., after whose time the island received its present name. Before this, it was called Fosetisland, from the Frisian goddess, Foseta, who had a temple here. The inhabitants of H. are divided into two classes, differing both in race and occupation—the one being fishers, the other merchants, cultivators, &c. The

first are Frisians, and, true to the habits of their ancestors, the Sea-kings of old, hold land-labour in utter contempt: they are bold and hardy sailors, and display great patience and endurance under privation. The merchant class consists of immigrants from Hamburg and other places on the mainland, or their descendants. The Frisian delights to call himself 'an Englishman,' but will by no means allow that title to his neighbour the merchant. The Frisians are a tall, muscular race, simple in their habits; while their marriage and funeral ceremonies are primitive in the extreme.

HELIOCENTRIC, a term in Astronomy, signifying that the sun (Gr. *helios*), is taken as the centre of reference or view. It is opposed to geocentric, which means that the earth is taken for centre. Thus, the heliocentric place of a planet is its place as seen from the sun: its geocentric, its place as seen from the earth.

HELIODORUS, the earliest and best of the Greek romance writers, was born at Emesa, in Syria, in the 4th c. A.D. He says that he belonged to a family who were priests of the sun, but he was himself a Christian, and became Bishop of Trikkia, in Thessaly. The time and place of his death are not known. The work by which he is known is entitled *Æthiopica*. It was written in his youth, and extends to ten books. It narrates in poetic prose, at times with almost epic beauty and simplicity, the loves of Theagenes and Charicleia. The work is distinguished from the later Greek romances not more by its original vigour than by its pure morality. The best editions are those of Mitscherlich in his *Scriptores Græci Erotici* (1799), and the Greek Coriæes (Paris, 1804). The *Æthiopica* has been translated into most modern languages.

HELIOGABALUS. See ELAGABALUS.

HELIO'METER, 'sun-measurer' (from *helios*, the sun, and *metron*, a measure), is an instrument invented by M. Bouguer in 1747, by means of which the diameters of the heavenly bodies can be measured with great accuracy. As improved by Dolland, the object-lens of the instrument is in two halves, each of which will form a perfect image in the focus of the eye-piece; and the images may be made to diverge, coincide, or overlap each other, by varying the distance between the half-lenses. If the diameter of the sun is to be measured, the two lenses are adjusted so that the images may touch each other, then the distance between the centres of the two object-glasses measured in seconds gives the diameter of the sun. The merit of the discovery of this instrument was contested by Mr Servington Savery, who had submitted a similar instrument to the Royal Society of London in 1743. Fraunhofer has made many remarkable improvements on this instrument.

HELIO'POLIS SYRIÆ. See BAALBEK.

HE'LIOS, the Greek name of the sun (corresponding to the Roman *Sol*), who was looked upon and worshipped as a god. He was, according to Homer, a son of the Titan Hyperion, and of Theia or Euryphæssa, and is described by the same poet as giving light both to gods and men. He rises in the east, from the marshy borders of Oceanus, into whose dark abysses he also sinks at evening. The later poets, however, give him a splendid palace in the east, somewhere below Colchis, and describe him as being conveyed, after the termination of the burning labours of the day, in a winged boat of gold, along the northern coasts of the sea back to Colchis. After the time of Æschylus, he began to be identified with Apollo or Phœbus, but the identification was never fully carried out.

His worship was widely spread. He had temples in Corinth, Argos, Troezen, Elis, and many other cities, but his principal seat was Rhodes, where a four-team was annually sacrificed to him. In addition, it was customary to offer up white lambs or boars on his altars. The animals sacred to him were horses, wolves, cocks, and eagles. Sculpture represents him, for the most part, as riding in his chariot, drawn by four horses.

HELIOTROPE (*Heliotropium*), a genus of plants of the natural order *Boraginæ* (q. v.); of the section, sometimes made a distinct order, *Ehretiaceæ*, the fruit separating only when ripe into four carpels. Many of the species have fragrant flowers. The **PERUVIAN H.** (*H. Peruvianum*), a small shrub, seldom more than two feet high, with oblong-lanceolate wrinkled leaves, and small lilac-blue flowers, is in almost universal cultivation for its fragrance, which resembles that of vanilla. The **EUROPEAN** or **COMMON H.** (*H. Europæum*), a native of the south and west of Europe, is an annual with small white, or rarely pale red, flowers. Important healing powers were once erroneously ascribed to it in cases of cancerous and scrofulous sores; it is, however, astringent and mucilaginous. Many hybrid heliotropes are now to be seen in flower-gardens and green-houses, exhibiting great variety in the size and colour of their flowers. They delight in a rich, light soil. The shrubby kinds are generally propagated by cuttings. Large quantities of the flowers are used by perfumers for making scents.—Classical fable accounts for the name *H.* (Gr. *helios*, the sun, and *tropo*, to turn), by representing Clytia as turned into this flower through gazing at Apollo.

HELIOTROPE AND **HELIOSTAT**, names applied to instruments used by surveyors for rendering distant stations distinctly visible. This is managed by placing a mirror at the distant station, and adjusting it so that at a particular hour of the day (arranged beforehand), the light of the sun shall be reflected from the mirror directly to the surveyor's station. The surveyor must make his observation almost at the instant he sees the glancing of the mirror, as the constant change of the sun's position in the heavens produces a corresponding change in the direction of the rays reflected by the mirror. Gauss (q. v.) invented such an instrument about 1821, which is used abroad, especially in America, for geodetic surveys, and is said to possess such power, that a mirror one inch square is visible eight miles off, in average sunny weather, and appears as a brilliant star at a distance of two miles; while some heliotropes have been used so powerful as to be visible nearly 80 miles off. The term *Helio-stat*, applied by Captain Drummond to an instrument invented by him for the same purpose, more properly belongs to an instrument invented by S'Gravesande, consisting of an equatorial revolving on its polar axis, so that the sun, when once accurately in the focus of the telescope, continues *steadily fixed* there. Drummond's heliostat is chiefly used in Britain.

HELIOTROPE, or **BLOODSTONE**, a variety of chalcedony or of jasper, of a green colour with red spots. The finest heliotropes consist of chalcedony, and are translucent, at least at the edges; the jasper bloodstones are opaque. *H.* is found in many parts of the world, as in Scotland, but the finest specimens of this mineral are brought from the southern parts of Asia. It was well known to the ancients, who obtained it chiefly from Ethiopia and Cyprus. It is much used for boxes, seals, &c.; and those specimens are most valued in which the ground colour is beautiful, and the spots bright and well

distributed. It was much used in the early ages of the Christian Church for the engraving of sacred subjects, the figures being so managed that the red spots should represent drops of blood. Different accounts are given of the origin of the name *H.*, none of them satisfactory.

HELL (Heb. *Sheol*, Gr. *Hades*, Sax. *Hell*, Ger. *Hölle*), originally a cavern or deep and dark abyss, and sometimes applied (as Gen. xxxvii. 35; Job xiv. 13) to the grave, is commonly used to signify the place, or the condition after death, of the souls of those who, having failed during life to fulfil the essential obligations imposed by the natural or the positive divine law, are consigned to a state of punishment or purgation. With the same unanimity which has existed as to a state of reward after death (see **HEAVEN**), almost all the various religions, whether ancient or modern, number among their most prominent doctrines the belief of a state of punishment after death—the nature of which is variously modified according to the peculiar tenets of each religion—for unexpiated guilt. Among early Christian writers, the word *hell* is variously employed, sometimes to signify a place of temporary purgation, in which sense it comprehends the Roman Catholic Purgatory (q. v.); sometimes the place (*Limbus Patrum*) in which the souls of the just of the old law awaited the coming of Christ, who was to complete their felicity; sometimes the place in which unbaptized children are believed to be detained, on account of the stain of unremitted original sin; and lastly, the prison of those who die stained with the personal guilt of grievous sin. Many controversies, which would be entirely out of place here, have arisen about the details of this doctrine, as to the place, the nature, and the duration of the punishment of hell. It will be enough to say that, although according to the literal sense of more than one passage of Scripture, and the popular notions of the various Christian communities, the place of hell would seem to be assigned to the interior abysses of the earth, or to the depths of the intermundane spaces, yet even the formularies of the Roman Catholic Church, with all their rigorous precision of detail, and still more those of other communions, have abstained from any formal declaration as to the locality of the punishment of the damned. As to the nature of the punishment to which they are subjected, whether it is confined to the 'pain of loss'—that is, to the remorseful consciousness of having forfeited the presence of God, and the happiness of heaven—or whether and to what degree it further includes the 'pain of sense,' there is some difference between the Eastern and the Western churches, and it is sometimes alleged that the Eastern Church altogether rejects the idea of punishment of sense. This, however, is a mistake; both churches agree that the punishment of hell includes the 'pain of sense,' the controversy between them having regarded not the existence of the pain of sense, but certain questions as to its nature, and especially whether it consists in material fire, a point which, in the decree for the union of the Greek and Latin Churches at the council of Florence, was left undecided. The controversy on the subject of the eternity of the punishment of hell dates from an early period, Origen and his school having taught that the punishment of hell was but purgatorial in its object; that its purifying effect having once been attained, the punishment would cease for all, even for the devils themselves; and that its duration in each case is proportioned to the guilt of the individual. This doctrine of the final restoration of all to the enjoyment of happiness, was the well-known Origenistic theory of the *apocatastasis*, to

which so many of the early writers refer. It was rejected, however, by the common judgment of antiquity, and was formally condemned by the second council of Constantinople—a condemnation founded on the literal sense of many passages of the Scripture (see Matt. xviii. 8; xxv. 41 and 46; Mark ix. 43; Luke iii. 7; 2 Thess. i. 9; Apoc. xx. 10, &c.); and in the controversies between the Eastern and Western churches, on the subject of the punishments of hell, the belief of their eternity, in the most strict sense of the word, was always recognised as a common doctrine of both. In the New Testament, the name *Gehenna* is frequently used to designate the place of punishment of the damned (see Matt. v. 22, 29, 30; x. 28; xviii. 9; xxii. 13; Mark ix. 43; Luke xii. 5; James iii. 6). The latter word, indeed, unlike the Hebrew *Sheol* and the Greek *Hades*, is never found in any other signification than that of the place of punishment of the sinner after death.

HELL GATE, or **HURL GATE**, named by the Dutch settlers of New York *Helle Gat*, is a dangerous pass in the East River, between Great Barn Island and Long Island, east of the centre of New York Island, United States, America. At certain stages of the tide, there are whirlpools which throw becalmed vessels on pointed rocks, but these rocks have lately been removed, and the navigation rendered safe by a new method of blasting, which consists in merely sinking the powder on to the rock, and exploding it by an electric spark.

HELLAS, the original home of the Hellenes, according to the received opinion, was first a town, and afterwards, under the name of Phthiotis, a well-known district of Thessaly. The ancients also sometimes applied this name to the whole of Thessaly. With the spread of the Hellenic people southwards, the term embraced a gradually increasing territory, until it came to denote the whole of Middle Greece or Greece Proper (modern *Livadia*). At a still later period, the Peloponnesus itself was included under the designation; and finally, H. came to be used in the broadest sense, as comprehending the whole of Greece, with its islands and colonies.—The **HELLENES**, or Greeks, as distinguished from the more ancient Pelasgians, received this name in the belief that they were descended from a certain Hellen. This mythical personage, a son of Deucalion and Pyrrha, or, according to others, of Zeus and Dorippe, and the father of Æolus, Dorus, and Xuthus, was said to have been king of Phthia, and to have ruled over all the country between the rivers Peneius and Asopus.

HELLEBORE, a name applied to two very different genera of plants. The genus to which it more properly belongs, and to which it has belonged, since very ancient times, *Helleborus*, is of the natural order *Ranunculaceæ*, and is characterised by a calyx of 5 persistent sepals, often resembling petals; a corolla of 8 or 10 very short, tubular, honey-secreting petals; numerous stamens and 3—10 pistils; a leathery capsule, and seeds arranged in two rows. The species are perennial herbaceous plants, mostly European, generally with a short root-stock: the stem mostly leafless, or nearly so, but sometimes very leafy; the leaves more or less evergreen, lobed, the flowers terminal. A familiar example of this genus is the **BLACK H.**—so called from the colour of its roots—or **CHRISTMAS ROSE** (*H. niger*), a favourite in our flower-gardens, because its large white flowers are produced in winter. The leaves are all radical; the stalks generally one-flowered; the flowers white or tinged with red. Black H. formerly enjoyed a higher reputation as a medicinal agent than it now

possesses. Melampus is represented as employing it in the treatment of madness centuries before the Christian era. The root is the part used in medicine, and it is imported into this country from Hamburg, and sometimes from Marseille. It

Christmas Rose (*Helleborus niger*).

consists of two parts—the rhizome or root-stock, and the fibres arising from it. The former is nearly half an inch thick, several inches long, and knotty, with transverse ridges and slight longitudinal striae; the latter are numerous, cylindrical, brown externally, and whitish internally. The taste is slight at first, then bitter and acrid. The chemical composition of the root is not very accurately known. It is not much employed at the present day, but it has been found of service (1) in mania, melancholia, and epilepsy; (2) as an emmenagogue; (3) in dropsy—its action as a drastic purgative, and its stimulating effect on the vessels of the liver, rendering it useful; (4) in chronic skin diseases; and (5) as an anthelmintic. Ten or fifteen grains of the powdered root act as a sharp purgative. The tincture, which is obtained by maceration in spirit, is usually given when its action as an emmenagogue is required. In an excessive dose, it acts as a narcotic acrid poison, and causes vomiting, purging, burning pain in the stomach and intestines, faintness, paralysis, and death.—**STINKING H.** (*H. fatidus*) grows on hills and mountains in the south and west of Europe, in some of the chalk districts of England, and in several places in Scotland. It has a very disagreeable smell, and green flowers somewhat tinged with purple. The stem is many-flowered and leafy.—**GREEN H.** (*H. viridis*), also found in the chalk districts of England, has a leafy stem, with a few large greenish-yellow flowers. The celebrated H. of the ancients was probably a species peculiar to Greece and the Levant, *H. orientalis* or *H. officinalis*; all the species, however, have similar medicinal qualities. From the abundance of the plant around the city of Anticyra, hypochondriacal persons were said to need a visit to Anticyra.—Closely allied to the genus *Helleborus* is *Eranthis*, in which the flowers are surrounded with an involucre, and have a deciduous calyx. A well-known species is the **WINTER H.**, or **WINTER ACONITE** (*E. hyemalis*), of our gardens, whose yellow flowers, raised only a few inches above the ground, deck the flower-border about the same time with snowdrops. It is a native of the midland parts of Europe, but

naturalised in many parts of Britain. It loves shady places.

WHITE H. (*Veratrum album*) belongs to the natural order *Melanthaceæ*. The genus has polygamous flowers, with 6-leaved perianth, 6 stamens, 3 pistils cohering at the base, a 3-horned capsule separating into 3 many-seeded follicles, and compressed seeds winged at the apex. White H. has a leafy stem, sometimes 4 feet high, ovate-oblong leaves, a long terminal compound panicle, and yellowish-white flowers. It abounds in the mountains of the centre and south of Europe, but is not found in Britain. The root was once much used in medicine, but now rarely, although it seems to act powerfully in some diseases. It is a very acrid and active poison. Its powder is used to destroy lice, and by gardeners for killing caterpillars. A decoction and ointment of it are sometimes used in itch and ring-worm. Caution is necessary even in handling the powder of White H., and very unpleasant effects ensue from its getting into the eyes or nose. —**AMERICAN H.**, or **SWAMP H.** (*V. viride*), known also as Indian Poke or Itch Weed, is frequent in damp grounds from Canada to Carolina. Its root has properties similar to those of white hellebore. These properties seem to depend chiefly on an alkaloid called *Veratria*.

HELLENIST (Gr. *Hellenistes*), the name given to those among the Jews, and afterwards in the Christian Church of Judea, who, either by birth or by residence, and by the adoption of the Greek language, manners, and usages, were regarded as Greeks, in opposition to the Hebrews properly so called, whether of Palestine or of the Dispersion. The name has sometimes been improperly restricted to persons of Greek parentage or descent; but like other Gentile names of the same form, it marks a class distinguished by the peculiar habits and language of Greece rather than by Greek descent. The Hellenists, in this sense, formed a distinct body, and stood in a relation of rivalry, if not of antagonism to the Hebrews (see Acts vi. 1, and ix. 29). There is also a clear distinction between Hellenes (Greeks—from *Hellas*, q. v.) and Hellenists. The latter might, it is true, be Hellenes by birth, but the prominent idea conveyed by the name was rather the adoption or affectation of Greek manners and language than Greek parentage or blood.

At the time of our Lord's crucifixion, the Jews of the Dispersion were to be found in almost every part of the Roman empire; but it was among the Jews settled in Alexandria that the Hellenising tendency found its freest development; and it is to that city that we must refer the formation as well of that peculiar dialect of the Greek language which is known as the Hellenistic, as of that singularly acute and speculative philosophy which exercised so large an influence on those early Christian schools, of which Origen is the most famous exponent.

The really characteristic element of the Hellenistic Greek consists in its foreign, and especially its Hebrew and Aramaic words and idioms. Although it was in its origin a purely popular form of the language, yet its being employed in the Alexandrian or Septuagint version of the Old Testament, has given to it all the fixedness and definite character of a written language. The Hellenisms of the Septuagint differ in many respects from those of the New Testament, which again present some points of discrepancy with those of the Alexandrian Fathers; but there are certain leading characteristics common to them all, which constitute the distinctive forms of the dialect, and which may also be described as peculiarities of structure and forms of thought derived from those Hebrew or Aramaic

idioms which were the native modes of speech of the Greek-speaking Hebrews.

The influence of the Hellenistic modes of thought on the philosophy of the Alexandrian schools will be traced under the head of the **NEO-PLATONIC PHILOSOPHY**.—See Frankel, *Monatschrift* (1855); also Winer, *Grammatik des N. Test. Sprachidioms* (2d edition).

HELLESPONT. See **DARDANELLES**.

HELLEVOETSLUIS, or **HELVOETSLUY'S**, a well-known fortified seaport of the Netherlands, in the province of South Holland, is situated on the Haring Vliet, an arm of the Maas, on the island of Voorne, 17 miles south-west of Rotterdam. It has an excellent harbour, as well as an arsenal, docks, and a naval school, and is one of the principal Dutch naval stations. By means of the New Canal of Voorden, leading from the Maas to H., and so out to sea, large vessels avoid the shallow bar at the mouth of the Maas. H. is to Rotterdam and the mouth of the Maas what the Helder is to Amsterdam and the Zuider Zee. Here William III. embarked for England, November 11, 1688. Pop. 3000.

HELLI'N, a town of Spain, in the province of Albacete, and 40 miles south-south-east of the town of that name, is situated in a hilly district near the eastern bank of the Mundo, a tributary of the Segura. Its houses are for the most part neatly painted, and, unlike most Spanish towns, it has an air of comfort and cleanliness. In the vicinity are productive royal sulphur mines. Pop. 10,200.

HELM, in Nautical Affairs, denotes the entire steering apparatus of a ship. This apparatus consists of three distinct portions—the rudder, the tiller, and the wheel; although in boats and small vessels the wheel is ordinarily dispensed with. The rudder is the instrument acting directly upon the water, and its mode of action and form will be described under **RUDDER** (q. v.). The tiller is a lever, formed into a handle, by means of which the steersman can greatly multiply on the rudder (the position of which is almost identical with the fulcrum, the hinges) the power he exerts against the long end of the tiller. The wheel is an ordinary wheel and axle, moving the long end of the tiller from side to side by the agency of ropes, again multiplying the power, and being otherwise convenient as occupying a smaller space on the upper deck than the long tiller (in this case below) would have taken. The principles of Steering (q. v.) will be given under that head. To 'put up the helm,' is to let the ship go more fully from the wind; while to 'put down the helm,' is to exercise a contrary effect, and to bring up the ship's head to the wind.

HELMET, in Heraldry. From the early simple form known as the Norman, the helmet, at a later period, came to vary in shape according to the degree of the person who wore it, and helmets

HELMETS.

were set over coats of arms to bear the crest, and indicate by their form the rank of the bearer. The part of the helmet which opens to shew the face is called the *visor* or *beaver* (to allow of drinking). The following forms of helmet are in use in English

heraldry: 1. The helmet assigned to the king and princes of the blood-royal, which is full-faced, composed of gold lined with crimson, and has the visor divided by six projecting bars. 2. The helmet of the nobility, of steel, with five bars of gold. When placed on the shield, it is exhibited in profile. 3. Knights and baronets have the full-faced steel helmet with the visor thrown back and without bars. 4. The helmet of esquires, always represented in profile, of steel with the visor closed. These distinctions are of comparatively recent date. A much greater variety of helmets is in use in continental heraldry. A helmet is never placed over the arms of any woman except the sovereign.

HELMET, a covering of metal or leather to protect the head in warfare. The earlier Greek and Roman helmets, as shewn by many extant sculptures, were surmounted by plumes, but unlike their modern successors, did not protect the face. During the middle ages, helmets were made of the

Helmets, 1645:

From a Specimen at Goodrich Court, engraved in Skelton's *Armour*.

finest steel, often inlaid with gold, and provided with bars and flaps, to cover the face in action, and to allow of being opened at other times. As the employment of firearms became more general, helmets naturally lost their utility, especially as regarded the face. Those still remaining are in military matters limited for the most part to heavy cavalry, afford no protection to the face, and must be considered as rather for ornament than use. Firemen wear a heavy head-piece of leather and brass, to protect them as far as possible from falling ruins at conflagrations. In India and other hot climates, helmets of white felt, with the additional screen of rolls of linen, are constantly worn by military men, to protect them from the rays of the sun.

HELMHOLTZ, HERMANN, one of the most distinguished scientific men of the present day, was born at Potsdam, in August 1821. He was at first a surgeon in the army, then assistant in the Berlin Anatomical Museum, and has since been professor of physiology, from 1849 at Königsberg, from 1855 at Bonn, and from 1858 at Heidelberg. Holding a very high place among physiologists, H. is no less distinguished in experimental and mathematical physics. His physiological works are principally connected with the eye and the nervous system. Thus, we have his exhaustive treatise on Physiological Optics, his *Speculum* for the Examination of the Retina, his Discourse on Human Vision; and various papers on the means of measuring small periods of time, and their application to find the rate of propagation of nerve-disturbances. Of a semi-physical nature we have his Analysis of the Spectrum, his explanation of Vowel Sounds (*Klangfarbe der Vocalen*, see SOUND); and his papers on the Conservation

of Energy with reference to Muscular Action. In physical science, he is best known by his great paper on Conservation of Energy (*Ueber d. Erhaltung d. Kraft*, Berlin, 1847, translated [badly] in Taylor's *Scientific Memoirs*, New Series); a popular lecture on the same subject (Königsberg, 1854); and by two masterly mathematical memoirs in Crelle's *Journal*, on Vortex-motion in Fluids, and on the Vibrations of Air in open pipes, respectively.

HELMINTHOLOGY (Gr. *helmins*, a worm, and *logos*, a discourse) is a term formerly used to denote the science of the natural history of worms generally, but now restricted to the red-blooded worms, such as the medicinal leech and earth-worm.

HELMONT, JAN BAPTISTA VAN, Lord of Merode, Royenborch, Oorschot, and Pellines, an eminent Belgian chemist, was born at Brussels in 1577, and died near Vilvorde in 1674. He went through the regular course of study at the university of Louvain, and on the completion of his education, he was offered and accepted the chair of surgery in that university, the duties of which he discharged for two years. The study of the works of Paracelsus seems to have turned his special attention to chemistry and natural philosophy, and in the pursuit of these sciences he spent several years in the different universities of Italy and France; after which he returned home, married Margaret van Ranst, a noble lady of Brabant, and settled down at his estate near Vilvorde, where he spent the remainder of his life in philosophical investigations of various kinds. It would be impossible, in the limits of this article, to sketch even an outline of his chemical discoveries. Writers of the history of chemistry regard him as the greatest chemist who

preceded Lavoisier; and it is much to be regretted that his language is often so obscure, that it is not always easy to ascertain his meaning. He was the first to point out the imperative necessity for employing the balance in chemistry. He paid much attention to the study of the gases, and is supposed by some authorities to have been the first to apply the term *gases* to elastic aeriform fluids. Of these gases he distinguished several kinds. He was also the first to take the melting-point of ice and the boiling-point of water as standards for the measurement of temperature. By means of the balance he shewed, in many instances, the indestructibility of matter among chemical changes. For example, he demonstrated that a salt dissolved in water, or silver dissolved in aquafortis, could be recovered unchanged in quantity. It is in his works that the term *saturation* is first employed, to signify the combination of an acid with a base; and he was one of the earliest investigators of the chemistry of the fluids of the human body.

Along with other physiologists of his day, he speculated much on the seat of the soul, which he placed in the stomach. His reasons are chiefly these two: 1. It cannot exist in the brain, because that organ contains (according to H.) no blood; 2. It does exist in the stomach, because when we hear bad news, we lose our appetite. Those who wish to know the full value of his contributions to the knowledge of chemistry, may consult the *Histories of Chemistry* written by Kopp and Höfer.

The most important of his works is his *Ortus Medicinæ, id est initia Physicæ inaudita, progressus Medicinæ norus in morborum ultionem ad vitam longam*, which was published by his son four years after his death, passed through a very large number

of editions, and was translated into Dutch, French, German, and English. A very curious volume, containing translations of some of his works, was also published by W. Charlton, in 1650, under the title of *The Ternary of Paradoxes; the Magnetic Cure of Wounds; the Nativity of Tartar in Wine; and the Image of God in Man*.

HELMSTEDT, a town in the north of Germany, in the duchy of Brunswick, 22 miles east-south-east of the city of that name, was formerly famous for its university, founded here by Julius Duke of Brunswick in 1575, and suppressed by Jerome Bonaparte in 1809. The university buildings now serve as court-houses. Manufactures of flannel, soap, hats, and grain-spirits are carried on. Here the first Saxons were baptized by St Ludgarus. Pop. 6700. H. was formerly a member of the Hanseatic League.

HELMUND, a river of Afghanistan, rises 35 miles to the west of Cabul, at an elevation of 11,500 feet. After a south-westerly course of about 650 miles, it loses itself in the salt lake of Seistan or Hamoon by several mouths, about 31° 30' N., and long. 62° E. The immediate banks, generally bordered by deserts on either side, abound almost everywhere with traces of former cultivation and wealth. Like tropical rivers in general, the H. varies largely in volume according to the season, being, in many places, thrice as deep and broad in the rainy season as it is at other times.

HELOISE. See ABELARD.

HELOTS. The population of ancient Sparta was divided into four classes, the lowest of which was formed of serfs or slaves, called Helots (probably meaning *captives*, from Gr. *helein*, to capture). These Helots are generally supposed to have formed the original population of the country, and to have been reduced to bondage by their Dorian conquerors, the numbers, however, being swelled from time to time by the conquest of enemies. They belonged to the state, which had the power to set them at liberty; but they toiled for individual proprietors, and were *bound to the soil*, i. e., they could not be sold away from the place of their labour. They were the tillers of the land (for which they paid a rent to their masters), they served at the public meals, and were occupied on the public works. In war, they served as light troops, each freeborn Spartan who bore heavy armour being accompanied to battle by a number of them, sometimes as many as seven. On rare occasions they were used as heavy armed soldiers. It is a matter of doubt whether after emancipation they could ever enjoy all the privileges of Spartan citizens. They were treated with much severity by their masters, and were subjected to degradation and indignities. They were whipped every year, to keep them in mind of their servile state; they were obliged to wear a distinctive dress (clothes of sheep-skin, and a cap of dog's skin); to intoxicate themselves, as a warning to the Spartan youth; and when multiplied to an alarming extent, they were often massacred with the most barbarous cruelty. On one occasion, 2000 of them, who had behaved bravely in war, were encouraged to come forward for emancipation, and were then most treacherously put to death. The Spartans organised, as often as necessity required, *secret service companies* (Gr. *crypteiai*) of young men, who went abroad over the country armed with daggers, and both by night and day assassinated the unfortunate Helots, selecting as their special victims the strongest and most vigorous of the oppressed race.

HELPS, ARTHUR, an English essayist and historian, was born about 1811, and was entered

at Trinity College, Cambridge, where he took the degree of B.A. in 1835. On leaving the university, he obtained a post in the civil service, and on his resignation, he retired to Bishop's Waltham, in Hampshire, where, in the possession of ample means, he enjoyed lettered ease. His first work of consequence, entitled *Essays Written in the Intervals of Business*, appeared in 1841. It was followed by two dramas, *Catherine Douglas*, and *King Henry the Second* (published in 1843), by an essay on the *Claims of Labour* (1844), and by *Friends in Council* (1847—1849). This last work has been, and still is, much admired by the selecter class of readers, and has gone through many editions. His *Conquerors of the New World and their Bondsmen* appeared in 1848, and *Companions of my Solitude* in 1851. His subsequent works are—*Oulita*, a play; *The Spanish Conquest in America* (1855—1857); *Friends in Council*, 2d series (1859); and an *Essay on Organisation*. At present (1862) he holds the important post of secretary to the privy council.

H. is the most delightful essayist since Lamb and Hunt. He everywhere exhibits acuteness, humour, a satire which gives no pain, and a quiet depth of moral feeling manifesting itself mainly in an earnest recognition of man's social responsibilities, while his style, in qualities of purity and clearness, can hardly be matched amongst his contemporaries. His historical works are of great value, containing all the merits of his essays, with a breadth of view and a mastery over details which are as rare as his style.

HELSINGFORS, a fortified seaport of Russia, capital of the government of Finland, and after Cronstadt, the most important naval station on the Baltic, is beautifully situated on a peninsula, surrounded by islands and rocky cliffs, in the Gulf of Finland, 191 miles west from St Petersburg by sea. A series of formidable batteries, called the fortifications of Sveaborg, and consisting of seven strongly fortified islands and numerous islets, protect the entrance to the harbour, and are of such strength, and so well appointed, as to warrant the application to them of the name of the Northern Gibraltar. The whole front presented by the successive works is about a mile in length, and, besides the casemates for small-arms, the united fortresses mount about 1000 guns, and are garrisoned by 12,000 men. The harbour itself is further defended by two forts. H. is the largest and handsomest town of Finland; the broad streets, consisting of houses painted externally yellow and green, intersect at right angles, and there are several fine public squares. Of the public buildings, the most striking are the residence of the governor, the senate-house, and the university buildings. The university, removed hither from Abo in 1829, where it had been founded in 1640, comprises five faculties, has 60 professors, and generally about 600 students. In connection with it are a library of 80,000 volumes, a hospital, a botanic garden, and a valuable observatory. Since 1840, H. has been a favourite bathing-place, and attracts many visitors during summer from St Petersburg. The town carries on a considerable trade in Baltic produce; it exports chiefly corn, fish, deals, and iron; and manufactures sailcloth and linen. Pop. 14,160.

H. was founded by Gustavus I. of Sweden in the 16th c., but the site of the town was removed nearer the shore in 1639. In 1819, it became the capital of Finland. During the late Russian war, Sveaborg was bombarded for two days and nights (9th and 10th August 1855) by a section of the allied fleet, without any material impression being made upon the forts.

HELST, BARTHOLOMEW VAN DER, a Dutch painter, was born at Haarlem in 1613, and died at Amsterdam in 1670. He attained great celebrity as a portrait-painter, and his works are numerous in Holland; one in particular (in the Chamber of Justice at Amsterdam), representing thirty full-length figures of a train-band with the Spanish ambassador in the midst, was pronounced by Sir Joshua Reynolds to be 'the first picture of portraits in the world.'

HELSTONE, an old market-town and municipal and parliamentary borough in the county of Cornwall, England, is pleasantly situated on an elevation, at the head of a pretty valley opening to the sea, about 10 miles west-south-west of Falmouth. It

Helvella Esculenta.

of the *Helvellæ* are edible, and much used in Germany.

HELVELLYN, one of the highest mountains of England, in the lake district, Cumberland, between Keswick and Ambleside. It is 3055 feet high, is easy of ascent, and commands magnificent views of the surrounding country.

HELVE'TIC CONFESSIONS. See CREEDS AND CONFESSIONS.

HELVE'TII, a Celtic people inhabiting, according to Cæsar, the region between the mountains of Jura on the west, the Rhone on the south, and the Rhine on the east and north, the region corresponding pretty closely with modern Switzerland. They had 12 towns and 400 villages. The great and fatal event in their history is their attempted irruption into and conquest of Southern Gaul, in which they were repulsed by Cæsar with frightful slaughter. The story of this expedition is circumstantially narrated by the Roman commander. They collected three months' provisions, burned their twelve cities, 400 villages, and all isolated dwellings, and made a general rendezvous by Lake Leman in the spring of 58 B.C. Cæsar hastened to Geneva, destroyed the bridge, raised two legions in Cisalpine Gaul, and when the Helvetians sent delegates to demand a passage, delayed them until he had built a wall along the Rhone, 16 feet high and about 19 Roman miles in length, flanked with redoubts. Having vainly attempted to pass this barrier, the H. took another route, but were followed and defeated with a terrible slaughter at Bibracte (modern Autun, in Burgundy), and the remnant obliged to return to their own country, where they became subject to the Romans. Of 368,000 who left their homes, including 92,000 fighting-men, only 110,000 returned. In the commotions which followed the death of Nero, the Helvetians

met with another terrible catastrophe. Remaining faithful to Galba, they were fallen upon by Cæcina, a general of Vitellius, who gave them to the rapacity of his legions. They were massacred by thousands, multitudes were sold to slavery, and their towns pillaged and burned, their capital destroyed, and their governor executed. From this time they scarcely appear as a distinct people.

HELVE'TIUS, CLAUDE-ADRIEN, sprung from a family of Swiss origin, as the name *Helvetius* implies, was born at Paris in 1715, and received a careful education. Intended for a financial career, he was sent, after the conclusion of his studies, to his uncle, D'Armancourt, *Directeur des Fermes*, at Caen, to obtain a practical knowledge of the subject, and at the age of twenty-three was appointed to the lucrative office of *Fermier-Général*; but the oppressive nature of the duties which it involved was not at all to the liking of H., who was of a very humane and easy disposition, and he quickly resigned it for the situation of chamberlain to the queen's household. He now led, like every other courtier of his time, a life of mere gallantry, which looks odious enough at this distance of time; but happily he soon grew tired of it, and after marrying in 1751 the beautiful and accomplished daughter of Comte de Ligneville, he withdrew to a small estate at Voré, where he spent the most of his life in the education of his family, the improvement of his peasantry, and literary labours. In 1758 appeared his celebrated work, *De l'Esprit*, in which he endeavours to prove feeling (*sensibilité*) to be the source of all intellectual activity, and that the grand lever of all human conduct is self-satisfaction. But he admits, at the same time, that self-satisfaction assumes different forms; e.g., the self-satisfaction of a good man consists in the subordination of private to more general interests—first, to the circle among which he lives; then to the community; and, finally, to the world at large. The philosophy of the book is, of course, materialistic. It was denounced by the doctors of the Sorbonne, and condemned by the parliament of Paris to be publicly burned. H. was much disgusted, and in 1764 left France to visit England and Germany, where Frederick II. received him with distinction. He died at Paris, 26th December 1771, leaving behind him a work, *De l'Homme, de ses Facultés, et de son Education*, which was published by Prince Galyzin (2 vols. London, 1772). Among the editions of his collected works, two deserve special notice, both published at Paris in 1795, the one in five and the other in thirteen volumes. His wife, who survived him many years, resided at Auteuil, near Paris, where she was visited by the most distinguished personages, and is often mentioned in the memoirs of that brilliant period.

HEMANS, FELICIA DOROTHEA, an English poetess, was born at Liverpool, 25th September 1794. At an early age she manifested a taste for poetry, in which she was encouraged by her mother. Her first volume was published in 1808, when she was only 14 years of age, and contained a few pieces written about four years earlier; her second, entitled *The Domestic Affections*, appeared in 1812. In the same year she married Captain Hemans of the 4th Regiment, whose health had suffered in the retreat on Corunna, and afterwards in the Walcheren expedition, and who found it necessary a few years after to remove to Italy. After that period they never met. Although five sons were born of this marriage, it was not understood to have been happy. Mrs H. spent the rest of her life in North Wales, Lancashire, and latterly at Dublin, where she died, 26th April 1835. Her principal works are

—*The Vespers of Palermo*, a tragedy (1823); *The Siege of Valencia*, *The Last Constantine*, and other Poems (1823); *The Forest Sanctuary* (1827); *The Songs of the Affections* (1830); and *Hymns for Childhood*, *National Lyrics* and *Songs for Music*, and *Scenes and Hymns of Life*. A volume of *Poetical Remains* was published after her death, and subsequently a complete edition of her works, with a memoir by her sister, was issued by Messrs Blackwood.

Mrs H., without great daring or force, is sweet, natural, and pleasing. But she was too fluent, and wrote much and hastily; her lyrics are her best productions; her more ambitious poems, especially her tragedies, being, in fact, quite insipid. Still, she was a woman of true genius, and one or two of her little pieces, *The Graves of a Household*, *The Treasures of the Deep*, *The Homes of England*, and some others, are perfect in pathos and sentiment, and will live as long as the English language.

HEMEROCALLIS. See DAY-LILY.

HEMICRANIA (Gr. *hemi*, one-half, and *kranion*, the skull; Fr. *migraine*; Eng. *megrims*), a variety of Headache (q. v.), distinguished by its affecting only one side at a time, and also frequently by its intermittent character; whence it has been termed, not very accurately, Brow-ague.

HEMIDESMUS, a genus of plants of the natural order *Asclepiadaceæ*. The root of *H. Indicus* is used in medicine, chiefly in India, and is known as Indian sarsaparilla. It is in some cases a good substitute for sarsaparilla, and appears to derive its properties from a crystallisable and volatile principle called *Hemidesmin* or *Hemidesmic Acid*. The plant is a climbing shrub, with leathery leaves and axillary umbels of flowers. It is common in almost all parts of India.

HEMIOPIA (Gr. *hemi*, one-half, and *ops*, the eye), vision limited to one-half of an object—a peculiar and rare form of disease, very imperfectly understood.

HEMIPLEGIA (Gr. *hemi*, one-half, and *plēssō*, I strike), Paralysis (q. v.) limited to one side of the face and body, and usually depending upon disease of the brain. Opposed in signification to Paraplegia (q. v.).

HEMIPODE (*Hemipodius*), a genus of gallinaceous birds, nearly allied to quails, but distinguished by a more slender beak, and by the want of a hind-toe. They are the smallest of gallinaceous

Andalusian Hemipode (*Hemipodius tachydromus*).

birds, and inhabit cultivated grounds and sterile sandy plains in warm countries. One species, the ANDALUSIAN H. (*H. tachydromus*), is found in Spain, Italy, Sicily, Africa, and Australia. Its whole length is about six inches.

HEMIPTERA (Gr. half-winged), an order of insects, with four wings, a mouth formed for sucking, undergoing imperfect metamorphoses, and having the first pair of wings either of a firm membranous substance without scales, or leathery at their base, and membranous at their tips. Those with the first pair of wings of the former character are the order *Homoptera* (q. v.) of many entomologists; the latter are the *Hemiptera* proper, the section or sub-order *Heteroptera* of Cuvier and others. The wings of the H. proper in general partly overlap each other, and are horizontal or slightly inclined when at rest. Some kinds are wingless, which, however, otherwise exhibit the characters of this order. Some of the H. feed on vegetable, and some on animal juices. The principal changes which they undergo in their metamorphoses are increase of size and development of wings. They are active in all stages. Some of them are aquatic. They are most abundant in tropical countries, and some of the tropical kinds are very splendid. Examples of this order are bugs, water-bugs, boat-flies, and water scorpions.

HEMISPHERE, the half of a sphere, when it is bisected by a plane passing through its centre.

HEMLOCK (*Conium*), a genus of plants of the natural order *Umbelliferae*, having compound umbels of small white flowers, small general and partial involucre, the limb of the calyx merely rudimentary, and a compressed ovate fruit with five prominent wavy ridges and no *vitta*. The best known and only important species is the COMMON H. (*C. maculatum*), which grows by waysides, on heaps of rubbish, and in other similar situations in Britain

Flowers and Root of Common Hemlock (*Conium maculatum*):
c, a flower; d, a seed.

and on the continent of Europe, in some parts of Asia, and now also as a naturalised plant in North America and in Chili. It has a root somewhat resembling a small parsnip; a round, branched, hollow, bright-green stem, 2–7 feet high, generally spotted with dark purple; the leaves large, tripinnate, of a dark shining green colour; the leaflets lanceolate, pinnatifid. All parts of the plant are perfectly destitute of hairs, and it is the only British species of the order *Umbelliferae* which has the stem smooth and spotted with purple. Both the general and partial umbels have many rays. The general involucre consist of several small leaflets; the partial involucre of three small leaflets, all on one side. The whole plant has a nauseous smell, particularly if rubbed or bruised.

The leaves are the only part of the plant employed in medicine. They should be gathered just before the time or at the commencement of flowering, and after the removal of the larger stalks they should be quickly dried by a heat not exceeding 120°. They should then be preserved in perfectly closed tin canisters. As, however, the dried leaves sometimes yield no *conia*, *conylia*, or *coniine* (a volatile alkaloid, which is the active principle in the plant), the fresh leaves are much more certain in their action.

The most important ingredient in H. is the *conia*, which is more abundant in the fruit (seeds) than in the leaves. From 40 lbs. of the ripe but green seeds, Dr Christison obtained two ounces and a half of hydrated conia. As it is volatile, it is obtained by distilling the seeds with water which contains a little potash in solution; conia, then, passes over with the water in the form of a yellowish oil, and when purified by redistillation, it is obtained as a colourless, transparent, oily liquid, having a specific gravity of 0.8, a penetrating, hemlock-like odour, communicating a burning sensation when applied to the tongue, and acting as a very energetic poison. It exhibits a powerful alkaline reaction, and precipitates many metallic oxides from their salts. Strong sulphuric acid causes its compounds to assume first a purple-red and then an olive-green colour; while nitric acid gives a blood-red colour, fading into an orange. Its composition is represented by the formula $C_{16}H_{15}N$. Wertheim has recently discovered a second alkaloid in H., which contains the elements of two equivalents more of water than conia. This substance, whose formula is $C_{16}H_{17}NO_2$, he names *conidrin*. It may be sublimed in beautiful colourless needles, and is much less poisonous than conia.

Conia has been introduced into the *Pharmacopœia Norvegica* under the name of *Conium*, the dose being from the one-fortieth to the one-sixtieth part of a grain. The following illustrations will give an idea of its activity as a poison: One drop placed in the eye of a rabbit killed it in nine minutes; three drops employed in the same way killed a strong cat in a minute and a half; while five drops poured into the throat of a small dog began to act in thirty seconds, and in as many more, motion and respiration had ceased. It seems to exhaust the energy of the spinal cord, and thus to cause muscular paralysis.

The uses of H. in medicine may be arranged under two distinct heads: 1. Those which depend upon its resolvent and alterative powers; and, 2. Those which have reference to its influence over the nervous system. 1. It has been found useful in mammary tumours and profuse secretion of milk, in bronchocœle, in enlargements of the liver, spleen, and pancreas, in scrofulous affections, &c., and at one time had a high reputation in cases of cancer. 2. It is useful as an antispasmodic and anodyne in whooping-cough, spasmodic cough generally, asthma, neuralgia, &c.

In large or poisonous doses it sometimes gives rise to coma (such as opium does), and sometimes to convulsions or violent delirium. Kercher relates the following singular instance of delirium from its use: Two priests ate hemlock-root by mistake; they became raving mad, and fancying that they were geese, plunged into the water. For three years they were afflicted with partial palsy and violent pain.

It may be administered internally in the form of powder (of the leaves), tincture, or extract, while externally it may be applied as a soothing application to ulcers, painful piles, &c., in the form of ointment or poultice. The conia being volatile,

often escapes from the powdered leaves and from the extract, and of the three preparations named, the tincture is the best. The *succus conii*, or *Preserved Juice of Hemlock*, prepared by Bentley and other pharmaceutical chemists, is more certain in its action than any of the pharmacopœial preparations.

In cases of poisoning by H., the evacuation of the stomach is the first thing to be attended to. Among the ancient Greeks, poisoning by H. was a common mode of death for condemned criminals,

Water Hemlock (*Cicuta virosa*):
a, a flower, the petals separated; b, root.

and thus it was that Socrates died; but whether it was the juice of the Common H. or the Water H. that was used, is unknown.—WATER H., or COWBANE (*Cicuta virosa*), is also an umbelliferous plant, of a genus having much vaulted umbels, a 5-toothed calyx, and almost globose fruit, each carpel with five broad flattened ribs and evident single *vittæ*. Water H. grows in ditches, the margins of ponds, and wet grounds in Europe and the north of Asia. It is more common in Scotland than in England. It has a large fleshy white root, covered externally with fibres; an erect much branched stem, 2–5 feet high; tripinnate leaves, with linear-lanceolate regularly and sharply serrated leaflets, no general involucre or only a single small leaflet, partial involucre of many short narrow leaflets, and white flowers. It is a virulent narcotic acid poison. Serious accidents have occurred from eating the root. Another species, *C. maculata*, is common in North America, growing in marshy places. It has a spotted stem, like that of true H., the name of which it very generally receives in North America. The leaves are tri-ternate, the leaflets ternate. It is a very poisonous plant, and is the cause of many deaths.—*Cicuta*, in Latin, seems to have been the name of the same plant called *Coneion* by the Greeks, but it is not known whether this or the previous plant was so denominated.

HEMLOCK SPRUCE. See FIR.

HEMP (*Can'nabis*), a genus of plants of the natural order *Cannabaceæ* (q.v.), having the male and female flowers on different plants; the male flowers with 5-partite calyx and 5 stamens; the female flowers with a spathe-like calyx of one leaf, rolled round the ovary and partially split along one side, and two threadlike stigmas. There is only one known species (*C. sativa*), varying considerably,

however, from soil, climate, and cultivation. It is an annual plant, a native of the warmer parts of Asia, but has been cultivated in Europe from the earliest historic times, and is now naturalised in many parts of Europe and America. Like flax, it wonderfully adapts itself to diversities of climate, and is cultivated equally under the burning sun of the tropics, and in the northern parts of Russia. It is, however, readily injured by frost, particularly when young; and in many countries where it is cultivated, it succeeds only because their summer is

Hemp (*Cannabis sativa*):

A, male inflorescence; B, female inflorescence.

sufficient for its whole life. H. varies very much in height, according to the soil and climate, being sometimes only three or four feet, and sometimes fifteen or twenty feet, or even more. Notwithstanding the nettle-like coarseness of its leaves, it is an elegant plant, and is sometimes sown on this account in shrubberies and large flower-borders. The stem is erect, more or less branched; the leaves are 5–9-fingered. The flowers are yellowish green, small, and numerous; the male flowers in axillary racemes on the upper parts of the plant; the female flowers in short axillary, and rather crowded spikes. The female plants are higher and stronger than the male, for which reason the female plants are popularly known in Germany as *Mastelhopfen*, and the male as *Femelhopfen*, the names being derived from the Latin *mas* and *femella*, and perpetuating an error which probably is as old as the time of the Romans. The stem of H. is hollow, or only filled with a soft pith. This pith is surrounded by a tender, brittle substance, consisting chiefly of cellular tissue, with some woody fibre, which is called the *reed*, *boon*, or *shove* of hemp. Over this is the thin bark, composed chiefly of fibres extending in a parallel direction along the stalk, with an outer membrane or cuticle.

H. is cultivated for its fibre in almost all countries of Europe, and in many other temperate parts of the world; most extensively in Poland, and in the centre and south of European Russia, which are the chief hemp-exporting countries. French H. is much esteemed in the market, as is also that of England and Ireland, of which, however, the quantity is comparatively inconsiderable. *Bolognese H.* and *Rhenish H.* are varieties remarkable for their height; and a fibre of very fine quality, eight or nine feet long, is known in commerce by the name of *Italian Garden Hemp*. In Britain, the cultivation of H. is almost confined to Lincolnshire, Holderness,

and a few other districts of England, of which the moist alluvial soil is particularly suited to it. In cultivating H., it is very necessary to have the soil so rich, and to sow the seed at such a season, that the plants shall grow rapidly at first, as they thus form long fibres. A crop of short scrubby H. is almost worthless. The finer kinds of H. are used for making cloth; the coarser, for sail-cloth and ropes. H. sown thin produces a coarser fibre than H. sown thick. Something also depends on the time of pulling, for the crop is pulled by the hand. When a rather fine fibre is wanted, and the seed is not regarded, the whole crop is pulled at once, soon after flowering; otherwise, it is usual to pull the male plants as soon as they have shed their pollen, and to leave the female plants to ripen their seed, in which case the fibre of the female plants is much coarser. The treatment of H., by *retting*, &c., is similar to that of Flax (q. v.). The fibre of H. is generally used for coarser purposes than that of flax, particularly for sailcloth, pack-sheet, ropes, and the caulking of ships.

The seed of H. is produced in great abundance. It is commonly sold as food for cage-birds; and birds are so fond of it, that not only the ripening fields, but the newly sown fields, must be carefully guarded against their depredations. A fixed oil, *oil of hempseed*, is obtained from it by expression, which is at first greenish yellow and afterwards yellow, and has an acrid odour, but a mild taste. This oil is used in Russia for burning in lamps, although the wick is apt to get clogged; also for making paints, varnish, and a kind of soft soap.

H. is cultivated in warm countries, not so much for its fibre as for a resinous secretion, which has narcotic or intoxicating qualities. See *HASHISH*.

H. is also used as a therapeutic agent under the name of *INDIAN H.*, or *BHANG*. In this country, it is administered in the form of resinous extract or of tincture; and it is usually prescribed (like opium) for its hypnotic, anodyne, and antispasmodic properties. Although less certain in its action than opium, it possesses these advantages over that drug—that it does not constipate the bowels, create nausea, or check the secretions, and that it is less likely to occasion headache.

The name Hemp (Ger. *Hanf*) is probably derived, along with the Greek and Latin *Cannabis*, from an oriental name, of which one form is the Arabic *Kinnub*. The name H. is often extended with some distinctive prefix to many of the fibres used for ropes and coarse fabrics, a practice which produces not a little confusion. Thus the fibre of *Apocynum cannabinum* (see *APOCYNACEÆ*) is called *CANADIAN H.*, as well as the plant itself; *BOWSTRING H.* (q. v.) is the fibre of the species of *Sansevieria*; *Sunn* (q. v.) is often called *SUNN H.*; it is also known as *BENGAL H.*, *BOMBAY H.*, *MADRAS H.*, and *BROWN H.*; *JUEBULPORE H.* is the produce of another species of *Crotalaria* (q. v.); the fibre of *Hibiscus cannabinus* (see *HIBISCUS*) is called *BROWN H.* and *DECKANEE H.* at Bombay; *MANILLA H.* or *ABACA* (q. v.) is the fibre of a *Musa*.

HEMS, HOMS, or HUMS (Lat. *Emesa*), a city of Syria, is situated about a mile east of the right bank of the Orontes, in lat. about 34° 44' N., long. 36° 43' E. It is 65 miles north-east of Baalbek and 110 miles west-north-west of Tadmor (Palmyra). It is clean, compactly built, and surrounded by old walls; and although there are now no ancient buildings remaining, the antiquity of the city is attested by numerous fragments of columns, by several Greek inscriptions, and the foundations of ancient baths with specimens of mosaic pavement. In ancient times, it was chiefly celebrated for its splendid temple of the Sun, one of the priests of

which, Elagabalus or Heliogabalus, was raised to the imperial throne of Rome. Under the walls of H., Zenobia was defeated by the Emperor Aurelian in 272 A.D. In 636, the city was taken by the Saracens, when its old Semitic name H. was revived; and in 1099 the Crusaders rode through its opened gates. Since then, H. has experienced many vicissitudes of fortune, all of which, however, it has survived, and is now the seat of a flourishing trade, and of several manufactures. Pop. between 20,000 and 30,000.

HEMSTERHUIS, TIBERIUS, a celebrated Dutch philologist, was born at Groningen, 9th January 1685. He became professor of Greek and of history at Leyden in 1740, where he died 7th April 1766. One of the greatest Greek scholars of his time, H. may be said to have created a new school of Greek philology, to which belong his distinguished pupils Ruhnken and Valkenaer. His editions of the *Onomasticon* of Pollux (1706), of the *Select Dialogues* of Lucian (1708 and 1732), and of the *Plutus* of Aristophanes (1744, by Schäfer 1811), are his principal literary works. A beautiful picture of his life is given in Ruhnken's *Elogium Hemsterhusii* (Leyd. 1768 and 1789), republished in Lindemann's *Vitæ dnumviorum T. Hemsterhusii et D. Ruhnkenii* (Leip. 1822). From H.'s MSS., *Anecdota Hemsterhusiana* (1825) have been edited by Geel, and *Orationes et Epistolæ* (1839) by Friedemann.

HENBANE (*Hyoscyamus*), a genus of plants of the natural order *Solanaceæ*, having a five-toothed calyx, an irregular funnel-shaped corolla, and a capsule opening by a lid, and enclosed in the hardened calyx. The species are mostly annual and biennial herbaceous plants, and natives of the countries near the Mediterranean Sea. The only species found in Britain is the COMMON H. (*H. niger*), which is not uncommon in waste places, and

Henbane (*Hyoscyamus niger*).

in the neighbourhood of towns and villages, particularly in calcareous soils, and on the sandy shores of Scotland. It is an annual or biennial plant, somewhat bushy, about two feet high; with large sinuate or sharply-lobed leaves without leaf-stalks, and large dingy-yellow flowers, with brownish-red or purple veins. The whole plant is covered with unctuous hairs, and has a nauseous smell, which gives warning of its strong narcotic poisonous quality. Cases of poisoning by H. are, however, not rare; but are more frequently owing to the proceedings of quacks, than to any mistake of the plant for an esculent.

The seeds contain in largest quantity the peculiar alkaloid on which the properties of the plant chiefly depend, *Hyoscyamia* or *Hyoscyamine*, which crystallises in stellated acicular crystals of a silky lustre. The symptoms of poisoning by H. are similar to those produced by other narcotic poisons, and the proper treatment is the same as in cases of poisoning by opium. In medicine, H. is employed both externally and internally. The leaves are the part commonly used: they are gathered and quickly dried when the plant is in full flower. Fomentations of H. are applied to painful glandular swellings, parts affected with neuralgia, &c., and are often found to afford relief. An extract of H. is sometimes employed instead of belladonna to dilate the pupil of the eye. Tincture and extract of H. are often administered in cases of annoying cough, spasmodic asthma, and other diseases requiring sedatives and antispasmodics. H. is also employed to calm mental irritation, and to induce sleep. For many cases, it has one great advantage over laudanum, in not producing constipation. The smoke from the burning seeds of H. is sometimes introduced into a carious tooth, to relieve toothache.

The other species of H. possess similar properties. The dried stalks of *H. albus* are used by smoking in Greece to allay toothache.

HENGST AND HORSA. See ANGLO-SAXONS.

HENGSTENBERG, ERNST WILHELM, a celebrated modern German theologian, was born 20th October 1802, at Fröndenberg, in Westphalia, where his father was clergyman. Prepared by his father for the university, he devoted himself at Bonn chiefly to oriental and philosophical studies, whilst at the same time he took an enthusiastic part in the *Burschenschaften*. Though sympathising thus in his early years with liberal and rationalistic movements in Germany, soon after going to Basel, in 1823, he came under the influence of the missionary institution there, and, before he had begun the professional study of theology, was drawn into the theological tendency which he has since represented. Going to Berlin, in 1824, as theological *Privat-docent*, he put himself at the head of a rising orthodox party, and has since, with most conscientious devotedness, made the scientific defence of their principles the aim of his labours in the university, and through the press. Though known as a theological author only by two little treatises—*Ueber d. Verhältniss d. innern Wortes zum äussern* (1825), and *Ueber Mysticismus, Pietismus und Separatismus* (1826)—he was made, in 1826 extraordinary, in 1828 ordinary professor; and in 1829, doctor of theology. Through the press, his influence has been exerted chiefly as editor of the *Evangelische Kirchenzeitung*, which was begun in 1827, and still combats rationalism even in its mildest forms, seeking to restore the orthodoxy and church-discipline of the 16th and 17th centuries. With the same view are written all his principal works; his *Christologie d. A. T.* (3 Bde. 1829—1835; 2te Aufl. 1854—1857); *Beiträge zur Einleitung ins A. T.* (3 Bde. 1831—1839); *Commentar über d. Psalmen* (4 Bde. 1842—1845; 2te Aufl. 1850); *Die Geschichte Bileams u. Seiner Weissagung* (1842); *Das Hohelied Salomons ausgelegt* (1853); and others are devoted to the defence of the old interpretation and criticism of the Scriptures against the results of modern biblical science in Germany. H.'s influence in ecclesiastical matters also, which was very great during the reign of the late king of Prussia, has been employed with thorough consistency in the direction of his theological tendencies, having been distinguished by a carrying out of the high Lutheran dogmas of the church, of church-offices, and of the sacraments, by

persecution of sectaries, by opposition to the union of Lutherans and Reformed, and by attempts to depose from their chairs Gesenius, Wegscheider, De Wette, and other rationalistic teachers in the universities. The recent triumphs of the Liberal party in Prussia have, however, destroyed his influence. [He died 28th May 1869.]

HENNA, or **HINNA**, a name originally Arabic, and sometimes found with the Arabic article incorporated in the form *Alhenna* or *Alkanna*, belongs equally to *Lawsonia inermis* and *L. spinosa*, shrubs of the natural order *Lythraceæ*. They differ in little, but that the one is unarmed and the other thorny, the latter being also the larger plant. Many botanists unite them into one species, under the name *L. alba*. H. grows in moist situations throughout the north of Africa, Arabia, Persia, and the East Indies. It is cultivated in many places for the sake of its flowers, which are much prized for their fragrance, particularly by the Egyptian ladies; but still more for the sake of the leaves, which abound in colouring matter, and which, being dried, powdered, and made into a paste with hot water and catechu, are very generally employed by women throughout the east to stain the nails and tips of the fingers of an orange colour; also by men to dye their beards, the orange colour being converted into a deep black by indigo; and for dyeing of the manes and hoofs of horses, and to dye skins and leather reddish-yellow. Powdered H. leaves form a large article of export from Egypt to Persia, and to various parts of Turkey, from which they find their way to more northern countries, and even to Germany, to be employed in dyeing furs and some kinds of leather. The use of H. for staining the nails appears—from allusions in ancient poets, and from some of the Egyptian mummies—to have prevailed from very ancient times.

HEN'NEGAU. See **HAINAUT**, or **HAINAULT**.

HENRY I., King of England, the youngest son of William the Conqueror, was born in 1068. When his brother, William II., was found dead in the New Forest, where they had both been hunting, on August 2, 1100, with a broken arrow in his breast, Prince Henry at once seized the reins of government, which, according to the then but imperfectly understood law of primogeniture, should have passed into the hands of his elder brother, Robert, Duke of Normandy, who was at the time in Italy, on his way home from crusading in Palestine. H. was crowned at Westminster, the third day after his brother's violent death. Regarding it he instituted no inquiry, possibly because he was privy to it; and he successfully held the crown against his brother Robert, at first negotiating with him, and granting him a pension to resign his pretensions, but finally making war upon his badly-governed duchy. Robert was defeated in a bloody battle before the walls of Tenchebray, on September 28, 1106, taken prisoner, and shut up in Cardiff Castle during the remaining twenty-eight years of his life. The acquisition of Normandy, the ancient patrimony of his family, had been a point of ambition with H., as he despised England and the English; but he had some trouble in keeping it, as the French king, Louis VI., and the Counts of Anjou and Flanders, took part with William, Robert's youthful son, whose virtues and misfortunes secured him friends. H., however, brought over to himself the Count of Anjou, by betrothing his only son to the count's daughter; he rendered neutral, by his eloquence and fair promises, Pope Calixtus II., whose intervention in the interests of justice had been besought; and he defeated the French king and his mailed knights in the almost bloodless battle of

Brenneville, in 1119. Next year his successes in arms and intrigue were darkened for life by the death of his only son William, who was drowned at sea on his passage from Normandy to England, unregretted by the English, who knew of his hatred towards them, his arrogance, and his gross vices. H. himself died from a surfeit of lampreys, on 1st December 1135, as he was preparing to leave Normandy, to repress an incursion of the Welsh. He was very anxious that his daughter Matilda, who had married Geoffrey Plantagenet, the boy Count of Anjou, on the death of her first husband, Henry V., emperor of Germany, should succeed him on the throne, and had twice made the English nobles swear fealty to her; but on his death the crown was seized by Stephen of Blois, the son of Adela, the Conqueror's youngest daughter.

Henry I. was styled Beaulerc, or the Scholar, in honour of his learning, which, for a king in his age, was not undeserving of distinction. He had great natural ability, especially in the line of state intrigue. Law was administered with considerable fairness, and not a little rigour, during his reign, and his administrative ability restrained the spirit of rebellion which had been seething incessantly since the Conquest. The punishment of crimes during his reign was capricious and barbarous; death, the loss of eyesight (which he is alleged to have inflicted on more than one of his relatives), and perpetual imprisonment, being the most usual penalties of the law.

HENRY II. of England was the grandson of Henry I. by his daughter Matilda, and her second husband Geoffrey Plantagenet, and was born in 1133. His mother, assisted by her illegitimate brother the Earl of Gloucester, in the early part of Stephen's reign, and towards its close by H. himself, had made war against Stephen, as a usurper, who had no good title to the throne. In 1153, when the rival armies were drawing near each other, a treaty for a compromise was set on foot, and in the course of it the only son of Stephen having died, it was agreed that Stephen should reign during his life, and that H. should succeed him, which he did on Stephen's death next year. He was crowned 19th December 1154, along with his Queen Eleanor, whom, at the age of eighteen, he had married within six weeks after she was divorced by Louis VII. of France. She was Countess of Poitou, and Duchess of Aquitaine, in her own right. H. inherited from his father Anjou, Touraine, and Maine, and his father and mother succeeded by force of arms, in keeping and taking possession of Normandy for themselves and him; so that, by one method and another, he came to be possessed of a large portion of France as well as England. His chief rivals in power were the clergy, who could use their weapon of excommunication with terrible effect, and who being tried by their own courts were not amenable to the common laws of the realm, and were protected from the punishment due to their crimes, which were too often of the deepest dye. To aid him in reducing the church to subjection to the civil power, he appointed his trusted chancellor, Thomas-à-Becket, to the see of Canterbury, and compelled him and the other ecclesiastics to agree to the 'constitutions of Clarendon'; a set of laws enacted by a sort of prototype of a parliament, or council of the barons, and having for their object to render the crown and the civil law (such as it had grown to be) superior to the church. Becket, however, proved to be a true churchman, and the long and obstinate struggle between him and his monarch was only terminated by his murder. See **BECKET**, **THOMAS A.** H. did penance at his grave, allowing himself to be scourged by monks; but

though the 'Constitutions of Clarendon' were formally repealed, the king was ultimately successful in reducing the church to subordination in civil matters. During his reign, occurred the conquest of Ireland. That country was then the home of a number of tribes or clans of the ordinary feudal type, and Pope Adrian IV., in 1156, by a bull, gave H. authority over the entire island, and ordered the inhabitants to obey him. He had not leisure at the time to conquer them, but afterwards, English aid being solicited by one of the Irish petty kings, Dermot of Leinster, H. gave leave to any of his subjects to aid him; and Robert Fitzstephens, constable of Albertivi, Maurice Fitzgerald, and Richard de Clare, surnamed Strong-bow, Earl of Strigul, went over with a very few hundred trained Englishmen, and in one year conquered Ireland. They succeeded so well, that H. became jealous, and recalled them; and next year (1172) he went over himself, to conquer in a royal way, and was everywhere loyally received, except in Ulster. This was the nominal conquest of Ireland, but the majority of the Irish tribes and chieftains continued to be independent barbarians for centuries.

During this reign, also, the first considerable ascendancy of England over Scotland was gained. H.'s sons, incited by their jealous mother, Queen Eleanor, rebelled against him, and their cause was espoused by the kings of France and Scotland. The latter, William the Lion, was ravaging the north of England with an army, when he was surprised at Alnwick, and taken prisoner, 12th July 1174. To obtain his liberty, he stipulated to do homage to H. for Scotland, to cede for ever to him the fortresses of Roxburgh and Berwick, and the castle of Edinburgh for a limited time. In the course of this filial rebellion, Henry, the eldest son, died of a fever, exhibiting great remorse, and Geoffrey was killed in a tournament at Paris. Richard, surnamed Cœur de Lion, with King Philip of France, obtained some advantages over his father. A treaty of peace was concluded between them, of which one of the stipulations was for an indemnity for all the followers of Richard. The sight of the name of his favourite son John in the list, acting upon a constitution weakened by many cares, threw the king into a fever, of which he died, 6th July 1189.

Upon the whole, H. was an able and enlightened sovereign. The barons were indeed overawed, but the monarch did not use his power despotically. Law made very great progress in his reign; circuit courts were established, and other improvements effected. The earliest writer on English law, Ranulph de Glanville, was H.'s chief justiciary. In intellect and character, he resembled his grandfather, Henry I., but his violations of the moral law were fewer, and less heinous. Still he had some illegitimate children, his mistress, the fair Rosamond, being the mother of two that are remembered: William Longsword, Earl of Salisbury, and Geoffrey, who became Archbishop of York, and who was faithful to him when his four legitimate sons took up arms against him.

HENRY III. of England, grandson of Henry II., and eldest son of King John, was born 1st October 1206, and succeeded to the throne on his father's death at the age of ten. He inherited his father's weakness, and he managed everything ill both at home and abroad. A war with France cost him Poitou, and might have been more disastrous, but for the virtuous disposition of the French king, Louis IX., commonly called St Louis. In his boyhood, under the direction of the judicious Earl of Pembroke, he ratified the Magna Charta; and he did so in manhood, to appease the discontent of his parliament, and obtain allowances of money. But

he kept no vows. He was beset with favourites chiefly from the country of his queen, Eleanor of Provence, and he allowed exorbitant exactions on the part of the clergy and the pope. His misrule roused the people and the barons in parliament, headed by his brother-in-law, Simon de Montfort, Earl of Leicester, who forced him to transfer his power temporarily to a commission of barons. He agreed to this by the provisions of Oxford in 1258. The barons were somewhat tardy in reforming the state, and the king desired to regain a power which he alleged, with truth, had been taken from him by compulsion, though wearing the appearance of free-will. The question of the validity of these provisions was submitted by both parties to St Louis of France, whose conscientiousness was such that foreigners could trust him. He annulled the provisions. Leicester and his party disregarded their agreement to be bound by his judgment, and took up arms against the king. They defeated him, and took him prisoner in the battle of Lewes, on 14th May 1264. The battle was followed by an agreement called the Mise of Lewes, more humiliating to the king than the provisions of Oxford. Leicester, being virtually king, summoned a sort of parliament; and to extend his popularity, which was already great, he intimated that boroughs should be represented, and this kind of representation was realised in embryo for the first time in English history. But his supremacy did not last long. Within a year, the powerful Earl of Gloucester deserted his party, and enabled Prince Edward, the talented son of the king, who had been taken prisoner at Lewes, to escape from captivity. They led an overwhelming army against Leicester, who was defeated and slain at Evesham, on 4th August 1265. The king died on 16th November 1272, and was succeeded by his son Edward. The weakness of H. and his father had allowed the development of the power of the barons, and the counterpoise of these two forces, regal and aristocratic, was approached in these reigns by a method which has developed into the British parliament. Statute law dates from the time of Henry III.; the 'Provisions of Merton,' passed in the 20th year of H.'s reign, being the first enactment on the English statute-book.

HENRY IV., of the House of Lancaster, on the deposition of his cousin Richard II. by the parliament, usurped the crown in 1399, in the beginning of which year he had succeeded his father, John of Gaunt, in the duchy of Lancaster. He was surnamed Bolingbroke, from the place (in Lincolnshire) where he was born in 1366, and had no valid title to the crown, or the pretence of it, except that he was the son of the fourth son of Edward III. The peace of his reign was disturbed by the Welsh, under Owen Glendower (q. v.), and by the Scotch, who were defeated, however, at Nesbit Moor on 22d June, and at Homildon Hill on 14th September 1402. Henry Percy (surnamed Hotspur), the conqueror in the latter engagement, and his family shortly after broke with the king, and leagued with the Scotch Earl Douglas and Glendower against him; but this coalition was destroyed by the battle of Shrewsbury on 21st July 1403. Other two insurrections followed, which were easily suppressed. The king grew to be afflicted with leprosy and epilepsy, and died of a fit in Westminster Abbey on 20th March 1413, in the 47th year of his age, having found a usurped crown to be a heavy burden, even for a strong head.

HENRY V., who succeeded his father Henry IV., was born at Monmouth (whence his surname), in 1388. In his youth he had acquired great military distinction in operations against Glendower,

and after his military work was put an end to, through his father's jealousy and distrust of him, he became almost equally celebrated for dissipation. But when he became king (21st April 1413), he shook himself in great measure free of bad habits and companions, and in an endeavour at the outset of his reign to be both just and generous, he liberated from the confinement in which his father had placed him the young Earl of March, who was the true heir to the crown, and restored the son of Hotspur to the lands and honours which his father had lost by rebellion. He paid a tribute to religion also, or rather to the orthodoxy of the age, by persecuting the Lollards by fire and halter. The great effort of his reign was an attempted conquest of France, in which he virtually succeeded. He had no right to the French crown; but in these days of usurpation and unsettled laws of succession, when might and right were practically identical, he seems to have believed sincerely that he had a right. In his first campaign to vindicate it, he besieged and took the town of Harfleur, and gained the battle of Azincourt (q. v.), October 25, 1415, against such enormous odds as to make his victory one of the most notable in history. Two years after, he again invaded France, and made Normandy once more subject to the English crown. An incapable king and civil discord aided him greatly. On the 20th May 1420, there was ratified at Troyes 'perpetual peace' between H. and the French. H. demanded and had conceded to him the regency of France, the eldest daughter of the king and queen to be his queen, and the succession to the French crown on the death of the king. He had hardly returned to England, and been married to this French princess, Catherine, when the defeat at Baugé, in March 1421, of his brother the Duke of Clarence, whom he had left governor of Normandy, by a force consisting largely of Scotch, and commanded by the Scotch Earl of Buchan, who killed the duke with his own hand, rekindled the hopes of the French, who supported the contention of Charles the dauphin against the treaty of Troyes, to which he had not agreed. H. returned to France for a third campaign, and his wonted success in arms was following him, when he was seized with illness, and died in a month on the 31st August 1422, in the 34th year of his age, leaving an infant to succeed him, and a splendid reputation for all those qualities that constitute a magnanimous monarch.

HENRY VI., the only child of Henry V. and Catherine of France, was born at Windsor on 6th December 1421. As he was not quite nine months old when his father died, his uncle John, Duke of Bedford, was appointed to govern France, and another uncle, Humphrey, Duke of Gloucester, to be 'Protector of the realm and Church of England,' with a council appointed by parliament to aid and control him, the parliament declining to appoint him regent, though the late king had desired it. The incapable Charles VI. of France having died, his son the dauphin assumed the title of Charles VII., and went on fighting with the English. His army, commanded by the Scotch Earl of Buchan, who had been appointed constable of France for his victory over the Duke of Clarence in the previous reign, and consisting of 14,000, half Scotch and half French, was almost annihilated by the English under Bedford, at Verneuil, on August 27, 1424. The Scotch auxiliaries ought not to have been there, as peace had been made with the Scots a year before, and their young king, James I., had been set at liberty, after a useful captivity of twenty years, and had returned to his kingdom with Lady Jane Beaufort, a daughter of the Duke of Somerset, and relation of the royal family, as his queen.

The victory of Verneuil was the last great success obtained by the English in France, and their power, which only force could support or justify, gradually crumbled down. In 1428, they laid siege to Orleans, but the siege was raised next year by the French, inspired by Joan of Arc (q. v.); and although she was burned as a witch by the English in 1431, their power continued to decline. Normandy was completely lost by the fall of Cherbourg in 1450; and ultimately, in 1453, they were expelled from all France (Calais excepted), greatly to the true advantage of both that country and England.

Disputes between Gloucester, the regent, and his uncle, the powerful Bishop of Winchester, as well as war with France, prevailed during the minority of the king. As he grew up, he manifested no tendency to either vicious or intellectual activity. He inherited, in fact, the imbecility of his grandfather, Charles VI. of France. In 1445, the weak king found a wife in the strong-minded Margaret of Anjou; and in 1447 the Winchester party, supported by her, succeeded in having Gloucester thrown into prison for high-treason, where he was soon found dead in his bed, without external mark of violence, but most likely murdered, as Edward II. had been, by thrusting a red-hot iron through his bowels. Winchester did not long survive his nephew and rival; and in 1450 the Duke of Suffolk, the queen's favourite minister, being impeached by the Commons, was condemned to be banished from the kingdom, but was shortly after taken, and executed on board one of the king's ships. The want of strength in the king, as well as in his title to the crown, was an invitation to every form of faction to display itself. Jack Cade, an Irish adventurer, who pretended to be a Mortimer, obtained a temporary possession of London; but the citizens overcame him and his pillaging followers, and he was taken and beheaded in a garden by the sheriff of Kent. The true representative of the Mortimers was Richard, Duke of York, and he was one of the unquiet spirits of the reign. As a descendant of Lionel, Duke of Clarence, the third son of Edward III., his title to the crown was superior to that of the king, who was descended from the Duke of Lancaster, the fourth son of that monarch, and he laid claim to the crown with more or less openness, according to circumstances. His influence and address was so great that in 1454, on the occasion of the king's weak mind being entirely eclipsed, he was appointed protector by parliament. On the king's recovery, he was indisposed to give up his power, and levied an army to maintain it. On May 22, 1455, the battle of St Albans was fought, and the Yorkists were victors; 5000 of the supporters of the House of Lancaster being killed, the Duke of Somerset, the queen's favourite minister for the time, being among them; and the king himself being taken prisoner. This was the first battle of twelve that was fought between the Houses of York and Lancaster, in the wars commonly called the Wars of the Roses, from the emblem of York being a white rose, and of Lancaster a red rose. (For a brief account of the struggle, see EDWARD IV.) H., after a checkered career, died May 22, 1471. In his cradle, he was proclaimed king of both France and England; but he lost both, having in intellect scarcely advanced from his cradle all his days, though throughout amiable and pious.

HENRY VII., the conqueror and successor of Richard III., was born at Pembroke Castle, the seat of his father, the Earl of Pembroke, on January 21, 1456. His father, Edmund Tudor, was the son of Owen Tudor, and of his wife, Queen Catherine, the widow of Henry V. His mother was a granddaughter

of John of Gaunt, parent of the House of Lancaster, and through her he derived his right (such as it was) to the crown. He was, indeed, the nearest heir, after Richard III. had murdered his nephews, the sons of Edward IV., except their sister Elizabeth, and Richard himself. The popular detestation against Richard's crimes was so great in England, that H., while residing abroad and bearing the title of Earl of Richmond, was invited to invade England, and rescue it from the tyrant. On the 7th of August 1485, he landed at Milford Haven, and marched across the country to Bosworth, in Leicestershire, where a battle took place on the 22d of August, in which Richard was slain. H. now ascended the throne. His reign was troubled by several impostors claiming the crown: first, Lambert Simnel, a joiner's son, who professed to be Earl of Warwick, was proclaimed king in Ireland, but was defeated at Stoke in 1487, taken prisoner, and turned into a scullion in the king's kitchen by H., who had a talent for turning everything to the most profitable purpose; second, Perkin Warbeck, who pretended to be the boy Duke of York, who had *not* been murdered in the Tower by Richard III., and was patronised by the Duchess of Burgundy, and supported by James IV. of Scotland, but was finally captured; and third, Ralph Wulfurd, who also pretended to be Earl of Warwick, but did not succeed in carrying his enterprise far, being almost at once taken and hanged in 1499. In this year H., apparently to free himself from further trouble from pretenders, had Warbeck, whom he had pardoned, and the true Earl of Warwick, a youth who had known captivity only all his days, convicted of a plot to recover their liberty, and executed. The execution of the latter is the chief blot in H.'s conduct, but his execution of Lord Stanley, who had helped him to the throne, also shewed a callous heart. Indeed this king was cunning and selfish, but prudent and not intemperate in revenge or in any vice except avarice, which led him to sell offices and pardons, commuting sentences passed by his corrupt and infamous Exchequer judges, Empson and Dudley. His avarice kept him from engaging in foreign war, a very small quarrel with France being all that he attempted in that way. It also kept him from returning the dowry of Catharine of Aragon, who had married his son Arthur, Prince of Wales, a boy of 14, just before he died, and led him to betroth her to his next son, who became Henry VIII., a betrothal from which flowed most important consequences. He married his eldest daughter, Margaret, to James IV. of Scotland, foreseeing that it might bring about a union of the crowns, and this was one of the most fortunate and prudent schemes of his reign. His wife having died, he was engaged looking out for another for himself, with a large dowry, when he died of consumption, on April 22, 1509. Bacon wrote a history of his reign, in which he represents him as a wise king, but does not conceal his avarice, explaining it rather by observing that the necessities and shifts of other great princes abroad set off to him the felicity of full coffers. Hume reckons his reign 'the dawn of civility and science' in England. Bacon says, that in it 'justice was well administered, save when the king was partie.' Some fresh light is thrown upon this and the preceding reign by a volume of state-papers, recently published by Longman.

HENRY VIII., King of England, second son of Henry VII. and Elizabeth of York, was born in 1491. On the death of his elder brother Arthur in 1502, he became heir-apparent to the throne. In his twelfth year, he was betrothed to his brother's widow, Catharine of Aragon, sister of Philip I. of Spain, thus early commencing a union afterwards

so fertile in evil-fortune. On his father's death, in 1509, H. was found to possess many accomplishments with no practical ability. Leaving Dudley and Empson, the instruments of his father's economic extortions, to fall a sacrifice to popular indignation, he proceeded to squander his treasures to his own high satisfaction, and to the great content of his people. He indolently allowed his ministers to manage everything for him, even to his marriage with Catharine. But if he knew nothing of the foreign relations of the kingdom, he could speak several languages with ease; and if he despised domestic business, never was there a monarch who presided more gracefully in the court, or behaved more gallantly at the jousts or in the hunting-field. His tastes were otherwise innocent enough. He was passionately fond of music and of display, and he indulged in no other excess than that of physical exercise, sometimes, it is said, exhausting four or five horses in the field in one day. It is especially noteworthy, that the early years of the king were spent with scarce a stain on the purity of his life.

For the first twenty years of his reign, England had no reason to be dissatisfied. The period, indeed, was not an eventful one. In the beginning of it (1513) there were two short wars—one with France, in which Terouenne and Tournay were taken, and one with Scotland, in which the victory of Flodden was won. The following years were of that calm which comes before the storm. Wolsey was then minister; and from 1515, when he was made Archbishop of York and chancellor, till his fall in 1529, he is wholly responsible for the government, and it was the best governed portion of H.'s reign. The foreign policy, it is true, was somewhat tortuous, guided to some extent, perhaps, by the aspirations of the cardinal to the triple crown; and it may be that, in his home-government, Wolsey often exhibited a jesuitical preference for accomplishing honest ends by dishonest means. The country, notwithstanding, was kept free from foreign embarrassments, and at home justice was administered.

Of the king, it cannot be said that during this period he did anything of consequence. When satiety and diminished means had checked the pursuits of his youth, he had betaken himself to those well-known theological studies which earned for him (1521) the honour of Defender of the Faith. His book, in defence of the seven sacraments, against Luther, although a work of some erudition, contributed nothing to the solution of the questions it touched. Timidity in examining received opinions was accompanied by corresponding vigour in denouncing those who, possessed of more courage, had proceeded from examination to dissent.

It is impossible not to connect these theological studies with the origin of the suit between H. and Catharine. The joyous temperament of H. had passed away, and in its place had come discontented gloom. In his now superstitious mind the fancy dwelt, that the early deaths of all his male children had been the judgment of Providence on some sin. From these dark thoughts the queen had not the power of weaning him. Older by six years than he was, her beauty had faded, and, haughty in her manners, she exacted all the stately etiquette of the Spanish court from one who had at no time felt for her more affection than was due to a bride selected for him by others. The nation, too, had grown dissatisfied with the union. The prospect of a succession left to be disputed around the person of a girl—the Princess Mary, who was the immediate heiress to the throne—was viewed with anxiety. Men remembered the horrors of the wars of the Roses, and feared that their children might see them repeated. The doubt as to the validity of

H.'s marriage with his brother's widow, which had been started at the time of its celebration, was one certain to be revived on the slightest occasion. A strange mixture of public spirit, religious or superstitious feeling, and selfish desire, now determined H. to seek a divorce.

In suing for the divorce, the king unexpectedly found a zealous assistant. Wolsey saw in it a means of detaching England from the alliance with Spain, odious to him as the power that thwarted his ambition, and ruled the papacy while pretending to obey it. Already his acute mind saw that the influence of the priesthood was decaying. Enthusiast as he was, he believed he could restore it. While sounds of reformation were echoing from Germany from beyond the walls of the church, Wolsey, almost alone in England, saw the danger; but he believed there was strength enough within the church to accomplish her own amendment, and he trusted now that the lost affections of the people might be brought back by a gracious exercise of the dispensing power, freeing them from a felt danger. Already the active schemer had arranged that when the work was done, the king should marry a daughter of France, converting an old enemy into a strong ally. With such ends in view, Wolsey (1527) prosecuted the divorce before Clement.

The pope found himself in difficulty. On the one hand, Francis I. supported England; on the other, Charles V. threatened. Clement pursued the traditional policy of Rome, and temporised. To gain time, he issued a commission to Cardinal Campegio and to Wolsey to try the question. Meanwhile, Wolsey's fair projects were rendered impossible. Anne Boleyn had been for many years about court, and when H.'s conscience grew too scrupulous to permit his cohabiting longer with Catharine, Anne lived constantly with him. When the king announced his intention of marrying her, Wolsey's desire for the divorce was at an end. The connection promised little to the nation, and he himself had every reason to dislike her, as her relatives belonged to those reformers who sought reform from without, and as such religious sympathies as could find a place in her frivolous mind leaned also to the new learning. He was now as anxious to procrastinate as Clement. The legates' court had been opened, argument had been heard; but on one excuse or another, judgment was delayed, till the changeable Clement revoked the commission, and (1529 A.D.) advocated the cause to Rome.

The revocation of the papal commission to try the divorce question, virtually ended the papal power in England, and the steps that follow are merely the working out of inevitable results. Wolsey, suspected on the best of grounds of having thwarted the divorce, was deprived of power, and a new ministry was formed (October 1529), in which, for the first time, laymen held the highest places. Sir Thomas More was chancellor. The chief adviser of the king was Wolsey's old servant, Cromwell. Parliament was called, and the members, finding that royal approbation was now given to their complaints, made out a formal list of grievances against the clergy. Their humble petition to his majesty set forth how the bishops cared for nothing but the episcopal revenues, and how they converted everything, from the powers of the diocesan courts downwards, into a means of extorting money. The king solemnly sent the document to convocation, and while the reply was under consideration, the Commons proceeded. Bills were passed, with little opposition, dealing with what were wont to be thought purely ecclesiastical matters, such as fixing the fees to be exacted in the probate courts, and abating some peculiarly

obnoxious imposts made in performing the last ceremonies for the dead. Parliament touched the clergy more closely still when they forbade them to follow secular employments, or to hold pluralities, and enjoined them to live in their parishes and perform their duties. These bills passed the Lower House with little opposition; in the Upper House, where the spiritual lords were numerous, they passed with difficulty. The king gave his assent willingly. When the bills became law, they were received by the people with great satisfaction.

Though these measures were significant enough of what might follow from his refusal, the pope still delayed. Time was suffered to wear on, and nothing made progress except the unpopularity of the clergy. Rome still shewing no symptoms of yielding, the king's political necessities again made him a reformer, and that of a very unscrupulous kind. He imposed a heavy fine on the clergy, under an old statute, for having recognised the legate authority of Wolsey without express royal sanction. Going still further, the Defender of the Faith declared himself the head of the church, and induced the clergy to recognise the title in consideration of his graciously remitting a portion of their fine (22 Hen. VIII. c. 15).

Parliament having again met (1530), advantage was taken of the king's disposition still more to limit the clerical power. The clergy had long ago forced the state to give up to them the right to try their brethren when accused of crimes. Their theory was, that he on whom consecration had wrought its mystic office, was too high for the secular arm. The practice was, that every one who claimed the character of clerk, from the highest dignitaries of the church to the crowds of mendicant friars, escaped with small fines after committing the gravest crimes. Parliament was thought to have gone far when it enacted that all below the rank of priest should be dealt with by the ordinary courts of the realm. The same parliament passed other acts, regulating the jurisdiction of the ecclesiastical courts, and making stricter provisions against bequests to the church.

These measures, bold and unusual as they were, affected Rome only indirectly. As it was evident that something to be more closely felt was requisite, one of the pope's highest and most lucrative privileges was attacked. The pope had long maintained that no high ecclesiastical dignity could be conferred without his approval, and in return for granting it, he received the first year's fruits of the benefice. These payments, called annates, amounted to a large sum, increased even beyond its legitimate amount by the dishonourable expedient of sanctioning the appointment of none but very old men. A bill passed both Houses abolishing these payments (23 Hen. VIII., c. 20). To make the measure serve its purpose more effectually, power was given to the king to call it into effect at any future time, while the hope was privately held out that this power would not be exercised if the divorce were granted.

While such measures were being passed, it may be believed that Sir Thomas More held office with pain and reluctance. Finding at last his influence powerless to restrain the advancing tide of secularism, he resigned, and a ministry was formed (1532) of which Cromwell was now the nominal as well as real head. The new ministry were prepared to push measures of reform as far as the temper of the king and the nation would permit. They desired nothing better than an open rupture with Rome. H., on the other hand, exhausted every effort of diplomacy to preserve the alliance with the church. Embassies, intrigues, plots of all kind, in Paris and

Rome, abounded in endless confusion at this time, making it impossible to determine the immediate cause of the separation, long since certain to ensue.

In the beginning of 1533, H., either impatient at the long delay, or as others say, and as the dates render not improbable, discovering that an illicit intercourse he carried on with Anne Boleyn had resulted in her pregnancy, was privately married to her. Within three months afterwards, the marriage was made public; and to complete matters, Cranmer, recently appointed Archbishop of Canterbury, held a court, as the highest ecclesiastical authority in England, and pronounced sentence of divorce, declaring the marriage of H. and Catharine to have been null from the beginning. In England these doings were accompanied by much rejoicing, and the king's former taste for pageantry revived in the magnificent ceremonial of crowning his new queen.

The news produced other effects in Italy and Germany. When the news of the marriage reached the Vatican, H. was cited to appear before the papal court. He refused, and appealed to a general council. When Cranmer's sentence reached Rome, the pope at once declared it illegal, and soon after, almost closed the door for further negotiation by rejecting the appeal to the council. The next steps on each side were taken almost simultaneously. The English parliament met, and under Cromwell's guidance, far outdid its predecessors. It passed an act entirely abolishing the papal authority within the realm (24 Hen. VIII. c. 12), giving the king, as on a former occasion, power to call the act into operation when he pleased. It then settled the succession on the issue of Anne Boleyn, to the exclusion of that of Catharine. Scarcely had these measures passed, when news came from Rome that the pope had pronounced judgment in the long pending divorce case, finding H.'s marriage to Catharine to have been valid. On the day following, H. called into operation the act abolishing the pope's authority.

H. having as yet done comparatively little to forfeit his early popularity, the sympathy of most was with him in the steps taken against those of his subjects who were disaffected with these changes. Among these steps, however, were some not easily defended, even according to the standard of the times. Minor victims fell unheeded, but all Europe was shocked when More and Fisher (Bishop of Rochester) were put to death for refusing to acknowledge the new succession, and to admit the king's right to the headship of the church. Even Henry's ally, Francis I., remonstrated. The worst effect of the cruelty was the alienation of the German Protestants, who ever afterwards held aloof from H. in spite of all Cromwell's efforts to cement an alliance. After this and other similar acts, which were not unfrequent, it may be said that H. never again received human sympathy. He pursued his course, however, aided by those from whom the dust of the conflict concealed his cruelty.

The state of the monasteries having long been a public scandal, Cromwell (1535) sent a commission to examine them. Acting on the reports of the commission, parliament abolished the smaller monasteries, which happened to be at once the weakest and the worst (27 Hen. VIII. c. 28). The disbanded monks made a large addition, both directly and indirectly, to the ranks of the disaffected; and to create further discontent, the swarms of vagabonds who had subsisted on the monastic alms were suddenly thrown for support on the yeomen.

The disaffection burst out in the rebellion known as the Pilgrimage of Grace (1536). Crowds who had

collected in Lincolnshire with hardly a definite aim, dispersed on the promise of redress in a parliament to be held at York. Redress, however, came not, and the crowds again gathered, this time under more skilful leaders, and with more definite purposes. The king's forces sent against them were insufficient. The whole of the north of England was in the hands of the rebels. Their grievances were a strange medley. Complaints of the law regarding the tenure of land were mixed with complaints that low-born men (such as Cromwell) advised the king, that the monasteries were being dissolved, and that the old faith was being altered. H., through certain commissioners, again negotiated with the insurgents, and terms were agreed on, the most important of which was a general amnesty, the benefit of which, however, Aske and the other leaders did not receive. The suppression of this rebellion was followed by the dissolution (in 1537) of the larger monasteries (31 Hen. VIII. c. 13).

In the midst of these civil commotions, two events took place both bearing on the Reformation, but of very different import. An order in council (1537) appointed the English translation of the Bible to be placed in every church, that all might read it. But as if to correct the idea that every one was thus to have the right of judging for himself in religious questions, an act of uniformity was passed. H. having now broken with many old professions, reduced his new professions to a creed, to be enforced by penalties, if more rational means should fail to commend it to the nation. Certain articles of religion were drawn up, and after some modifications, were framed into those known as the 'bloody six articles.' The statute (31 Hen. VIII. c. 14) containing these articles—named, with much simplicity, 'An act for abolishing diversity of Opinions'—is very brief, but very formidable. The doctrines were substantially those of the Roman Catholic Church. The articles made no pretensions to form a complete or systematic creed; they embodied the points as to which most conflict of opinion prevailed; and formidable, indeed, were the sanctions enforcing them. Whoever denied the first article (that embodying the doctrine of transubstantiation) was to be declared a heretic, and burned without opportunity of abjuration; whoso spoke against the other five articles should, for the first offence, forfeit his property; and whosoever refused to abjure his first offence, or committed a second, was to die like a felon. To this act Cromwell himself fell a victim. He had been silent in face of the combination which carried it; but having secretly used all his influence as a member of government to thwart its execution, by staying proceedings and giving pardons, he lost H.'s confidence, and was put to death.

The last years of the reign of H. were disturbed with small wars with Scotland and France, inimical to progress. He died on 28th January 1547, unhonoured, unmourned; and yet few rejoiced, for his policy had left England so divided at home, so friendless abroad, that no man could look with confidence to the future.

The character of H. has of late been discussed at greater length than the subject deserved. The mere recital of the occurrences of his private life is sufficient to justify most of the infamy which tradition has attached to his name. The divorce of Catharine and the marriage of Anne Boleyn have already been told. Within a short time after the birth of the Princess (afterwards Queen) Elizabeth, H.'s affection for Anne ceased. He suspected her—not, it must be admitted, without ground—of adultery, and, after a hurried trial, had her condemned and executed (1536). On the day after the execution,

he married Jane Seymour, against whom nothing more is known than that she was the king's partner in this revolting proceeding. Jane Seymour died (1537) in giving birth to Edward VI. The story of Anne of Cleves follows. The marriage, a political one, arranged by Cromwell to connect H. with the German Protestants, was unfortunate from the beginning. H. was deceived as to her personal attractions, and (1540) obtained a divorce to free himself. His fifth wife, Catharine Howard, was (1541) within a few months divorced and executed for an adultery well-enough established. His sixth wife, Catharine Parr, survived him, and so the catalogue ends. Passing from the domestic circle to that of his immediate associates, H. is found as incapable of friendship as he was either of feeling or of evoking love. He had three great ministers—Wolsey, More, and Cromwell—all men of high talent and worth, and all on terms of the closest intimacy with the king, yet all in the hour of need thrown aside. Disease and a broken spirit saved Wolsey from a worse fate; but it is little wonder that every Catholic should detest the memory of him who sent More to the scaffold for adhering to opinions which he himself had held shortly before, or that Protestants should execrate the memory of the man who violated justice and consistency to put to death the first great Protestant minister. If such were the mercies he vouchsafed to those who were with him, it may easily be imagined how he dealt with those who were against him. Claims of political necessity cannot excuse the cruelty with which he persecuted every relative of Cardinal Pole, from the aged Countess of Salisbury to lesser victims. It may, however, be safely admitted, that tradition has exaggerated H.'s cruelties—that there is no truth, for example, in the tale which gives 73,000 as the number of executions in his reign; and it may be further admitted, that he did not wantonly commit murders—that he had always before him in his crimes some object, either of misconceived justice, or of policy; but after allowing for everything, enough remains to explain the universal detestation in which Protestant and Catholic have combined to hold his name.

HENRY II., King of France, was born in 1518; married Catharine de' Medici in 1533; succeeded his father, Francis I., in 1547. The money which his father left was rapidly squandered among his favourites and mistresses. A revolt in Guienne, where the people had risen against the *gabelleurs*, or collectors of the salt-duty, was the first event that roused the king and court from their slothful ease. This disturbance was, however, speedily put down by Montmorency. Through the influence of the Guises, whose sister, the dowager-queen of James V., sought the aid of France to support her against the ambitious designs of the English government, a French alliance was cemented with Scotland, and war declared against England, which began in 1550 with the recovery of Boulogne, and ended in 1553 with the taking of Calais, after that city had been 210 years in the hands of the English. Curiously enough, while the king tried to put down heresy with fire and sword at home, he made treaties of alliance with the German reformers, and sent an army of 38,000 men to aid Maurice of Saxony against the emperor; and taking the command in person, made himself master of Toul and Verdun, while Montmorency, through the treachery of the garrison, seized upon Metz. After the abdication of Charles V. (1556), and the division of his vast empire between his brother Ferdinand and his son Philip II., H. seized the opportune occasion of attacking the Netherlands and Italy before Philip II. had time to consolidate his newly

acquired powers, but the results of this step were disastrous to France at every point. In Italy, the attack on Naples, made by Guise at the head of 20,000 men, utterly failed through the pusillanimity of the pope, and the energetic advance of Alva; while in the Low Countries, the French under Montmorency sustained a total defeat, in 1557, at St Quentin, where the flower of the French chivalry were either slain or taken captive by the troops of Philip, who were commanded by Philibert-Emmanuel, Duke of Savoy.

These reverses were followed by the treaty of Château-Cambresis (1559), in which H. agreed, in exchange for the restoration of Ham, St Quentin, and Castelet, and the liberation of Montmorency, to resign nearly all his conquests in the Low Countries, Piedmont, and Southern Italy, including 190 fortresses and strongholds. Shortly after, he was mortally but accidentally wounded in a tournament by Count Montgomery, a Scottish nobleman, and captain of his guard. He died 10th July 1559.

HENRY III., the third son of Henry II. and Catharine de' Medici, was born in 1551, and succeeded his brother Charles IX. in 1574. On the death of the Constable Montmorency, he received the chief command of the army, and his first campaign, fought in his 16th year, was signalised by two decisive victories, gained over the Protestants at Jarnac and Moncontour. In 1573, the intrigues of the queen-regent secured to him the election to the vacant throne of Poland. He failed, however, to secure the attachment of the Polish nobles; and on receiving the tidings of his brother's death, he fled by night from Cracow, and on his return to France, was proclaimed king of that country. His mother and the Guises had little difficulty in persuading him to continue the religious civil war. The union of the Protestants with the party of discontented nobles, headed by the king's brother, the Duke d'Alençon, compelled the alarmed sovereign to grant the former the free exercise of their religion, and various other rights. This exasperated the Catholic party, who, headed by Henry of Guise, formed the confederation known as the *Sainte Ligue*, the object of which was not merely to assert the undivided supremacy of Catholicism, but also to secure the reversion of the throne to Guise, and civil war again and again burst out with renewed violence.

H. availed himself of his intervals of quiet to indulge his own vicious propensities; and while his mother ruled the state, and the Guises were undermining his throne, his days and nights were spent in an alternation of the most dissolute excesses, and the wildest outbreaks of fanaticism. One day he might be seen passing, to the sound of music, through the streets of Paris, accompanied by a band of young men as effeminate as himself, known as the Mignons, and surrounded by parrots, monkeys, and pet dogs, while the next day he and his companions would shew themselves clad in a penitent's dress, wearing masks, and carrying in their hands scourges, with which they flagellated one another as they sang aloud penitential psalms.

The assassination of the Duke of Guise in 1588 finally aroused the hatred of the nation. The doctors of the Sorbonne declared the people to be relieved of the duty of obedience to the king, and the Leaguers dissolved the parliament. H., who was now, for the first time, thrown on his own resources—his mother had just died—was distracted by the difficulties of his position; and in his perplexity at hearing that Guise's brother, the Duke of Mayenne, had been declared lieutenant-general of the kingdom, threw himself under the protection of Henry

of Navarre. The newly reconciled kings advanced at the head of 40,000 Huguenots on Paris, which, although gallantly defended by Mayenne, would probably have had to capitulate, had not the current of events been suddenly checked through the agency of a fanatical young dominican-brother, named Jacques Clement, who, on 1st August 1589, on pretence of having important tidings to communicate to H., killed him by plunging a knife into his body. The murderer was slain on the spot by the royal guard, and his victim died the following day, after having declared his kinsman, Henry Bourbon of Navarre, his successor.

HENRY IV., King of France and Navarre, surnamed 'The Great,' and 'The Good,' was born in Bearn in 1553. H. was the third son of Antoine de Bourbon and Jeanne d'Albret, daughter and heiress of Henry, king of Navarre and Bearn. His father's death placed him under the sole control of his mother and grandfather, at whose court he was trained to the practice of knightly and athletic exercises, and inured to the active habits and rude fare common to the Bernais mountaineers. His mother, who was a zealous Calvinist, was careful to select learned men holding her own tenets for his instructors; and having discovered that a plot was brooding to remove him to Spain by force, to train him in the Catholic faith, she conducted him, in 1569, to La Rochelle, and presented him to the assembled Huguenot army, with whom he participated in the battle of Jarnac. H. was now chosen chief of the Protestant party, although, on account of his youth, the principal command was vested in Coligny (q. v.). Notwithstanding the defeats which the Huguenots had experienced in this campaign, the peace of St Germain which followed was apparently most advantageous to their cause, and was speedily followed by a contract of marriage between H. and Margaret of Valois, the sister of Charles IX. After much opposition on the part both of Catholics and Protestants, the marriage was celebrated with great pomp in 1572, two months after the sudden death of the Queen Jeanne, which was probably due to poison, and within less than a week of the massacre of St Bartholomew. It had been originally intended that H. was to share the fate of his friends and co-religionists; but his life was spared on condition of his professing himself a Catholic. Three years he remained at the French court, virtually a prisoner; but at length, in 1576, H. contrived to elude the vigilance of the queen-mother, and escaped to the camp of the Huguenots in Alençon, where, having revoked his compulsory conversion, he resumed the command of the army, and by his address gained several signal advantages, which constrained the king to consent to a peace highly favourable to the cause of the reformers. The death of the Duke of Anjou (late Alençon) gave H. the rank as first prince of the blood-royal, of presumptive heir to the crown, while the murder of Henry III., in 1589, made him, in right of the Salic law, and as the nearest lineal male descendant of the royal house of France, rightful king of France. As a Protestant, lying under the ban of papal excommunication, he was obnoxious to the greater part of the nation; and finding that the Dukes of Lorraine and Savoy, and Philip II. of Spain, were prepared, each on his own account, to dispute his claims, he retired to the south until he could collect more troops and obtain reinforcements from England and Germany. His nearly hopeless cause, however, gradually gained strength through the weakness and internal dissensions of the Liguists, who, in their anxiety to circumvent the ambitious designs which Philip II. cherished in favour of his daughter (niece

of Henry III.), notwithstanding her exclusion by the Salic law, proclaimed the aged Cardinal Bourbon king, with the Duke of Mayenne lieutenant-general of the kingdom, and thus still further complicated the interests of their party. In 1590, H. won a splendid victory over Mayenne at Ivry. In 1593, the assembly of the States-general, by rejecting the pretensions of Philip II., and insisting on the integrity of the Salic law, smoothed H.'s way to the succession, although it is probable that he would never have been generally acknowledged had he not, by the advice of his friend and minister, De Rosny, afterwards Duke de Sully (q. v.), formally professed himself a member of the Church of Rome. The ceremony of his recantation of Protestantism, which was celebrated with great pomp at St Denis in July 1593, filled the Catholics with joy, and was followed by the speedy surrender of the most important cities of the kingdom, including even Paris, which opened its gates to him in 1594. The civil war was not, however, wholly put down till four years later. In the same year, 1598, peace was concluded between Spain and France by the treaty of Vervins, which restored to the latter many important places in Picardy, and was otherwise favourable to the French king; but important as was this event, it was preceded by a still more memorable act, for on the 15th April, H. had signed an edict at Nantes, by which he secured to Protestants perfect liberty of conscience, and the administration of impartial justice. H. was now left at liberty to direct his attention to the internal improvements of the kingdom, which had been thoroughly disorganised through the long continuance of civil war. The narrow-minded policy that had been followed during the preceding reigns had left the provinces remote from the capital very much at the mercy of the civic governors and large landed proprietors, who, in the absence of a general administrative vigilance, arrogated almost sovereign power to themselves, raising taxes, and exacting compulsory services. These abuses H. completely stopped, and by making canals and roads, and thus opening all parts of his kingdom to traffic and commerce, he established new sources of wealth and prosperity for all classes of his subjects. The mainspring of these improvements was, however, the reorganisation of the finances under Sully, who, in the course of ten years, reduced the national debt from 330 millions to 50 millions of livres, although arrears of taxes to the amount of 20 millions were remitted by the king during that period. On the 14th May, the day after the coronation of his second wife, Mary de' Medici, and when about to set out to commence war in Germany, H. was assassinated by a fanatic named Ravallac. Nineteen times before attempts had been made on his life, most of which had been traced to the agency of the papal and imperial courts, and hence the people, in their grief and consternation, laid Ravallac's crime to the charge of the same influences. The grief of the Parisians was well-nigh delirious, and in their fury they wreaked the most horrible vengeance on the murderer, who, however, had been a mere tool in the hands of the Jesuits, H.'s implacable foes, notwithstanding the many concessions which he made to their order.

Time has strengthened the high estimate which the lower classes had formed of their favourite king, for although his faults were numerous, they were eclipsed by his great qualities. Inordinate love of women was his worst fault, and the cause of much evil in his own and succeeding reigns, for his prodigality and weak indulgence to his favourite mistresses, Gabrielle d'Estrées and Henrietta d'Entraques, and his affection for the natural

children which they bore him, were a scandal to the nation, and a source of impoverishing embarrassment to the government. As authorities in regard to Henry II., III., and IV., in addition to the general histories of France, the following works may be consulted: Anquetil, *Esprit de la Ligue*; Petitot's *Collection of Mémoires*; De la Saussaye, *Histoire de Blois*; *Documents de l'Hist. de France*; Matthieu, *Hist. de Henri IV.*; Memoirs and Letters of De Thou, D'Aubigné, Pasquier, Duplessis-Mornay; Capéigne, *Hist. de la Réforme et de la Ligue*; Pérèfixe, *Hist. de Henri IV.*

HENRY III., Emperor of Germany, of the Salo-Franconian line, and the son of the Emperor Conrad II., was born in 1017, elected king of the Germans in 1026, Duke of Bavaria in 1027, Duke of Swabia and Burgundy in 1037, succeeded his father as emperor in 1039, and died in 1056. H., who was possessed of natural abilities, which had been cultivated as far as the age permitted, was one of the most energetic and efficient rulers of Germany. By his vigour he maintained his ascendancy notwithstanding the encroachments of the church and the subordination of the princes of the empire. Having summoned a council at Sutri in 1046, he availed himself of the influence which he had acquired in Italy, by his judicious reconciliation of antagonist parties, to secure the recognition of a new pope, Clement II., and thus brought to an end the scandalous dissensions which were disturbing Christianity through the intrigues of three rival popes, Benedict IX., Sylvester III., and Gregory IV. By his energetic maintenance of the integrity of the empire, he gained opportunities of adding new territories to the imperial states, for having retaliated on the Duke of Bohemia for the hostilities which he had carried on against the Poles during the intestine disorders of Poland, his decisive successes compelled the Bohemian duke to acknowledge himself vassal of the empire; while H.'s campaign against Hungary had a similar result, terminating in 1047 in the recognition of the supreme power of the emperor over the kings of Hungary. He also secured powerful vassals in Italy, in the Norman conquerors of Apulia and Calabria.

H. devoted the short intervals of peace which he enjoyed to the eradication of numerous abuses in the church, but his schemes of ecclesiastical reform were secretly frustrated by Hildebrand, afterwards Gregory VII. (q. v.); and on the sudden death of H., who is supposed to have been poisoned, the papal chair was found to have already entered upon decisive measures for its emancipation from imperial influence. H. distinguished himself as the zealous promoter of learning and the arts, especially music. He also founded numerous monastic schools, over which he placed learned monks of Brittany, and built several churches, and the cathedrals of Worms, Mayence, and Spire, in the last of which he was interred.

HENRY IV., Emperor of Germany, the son and successor of the former, was born in 1050, elected king of the Germans in 1054, during the lifetime of his father, crowned emperor 1084, and died 1106. As he was only five years old at the death of his father, the regency was, in accordance with the wishes of the latter, confided to the child's mother, Agnes of Poitiers. H.'s perpetual quarrels with the Saxon princes and peers occupied his best years, and were the principal cause of the subsequent troubles and mortifications which have given a memorable interest to his history. Unhappily for him, he was induced in 1074, after having suffered defeat and various insults at the hands of his Saxon vassals, to appeal to the pope for

his intervention; and Gregory VII., who was only too happy to have an opportunity of interfering in the matter, despatched plenipotentiaries to settle the differences in Saxony, and availing himself of the occasion to prosecute his own plans, commanded the king to abstain from the sale and granting of benefices while this quarrel was pending. Before these directions reached Germany, H. had, however, settled his own affairs by defeating the Saxon insurgents in a great battle at Hohenburg, taken their princes captive, and rebuilt all the strongholds which they had dismantled; while his councillors had prosecuted a vigorous business in the interdicted sale of benefices. H. not only approved their conduct, but responded to the pope's remonstrances on the subject, and his summons for his appearance at Rome, by declaring, through an assembly of German bishops and abbots, which met at Worms in 1076, that the pontiff was deposed. Gregory VII. retaliated by excommunicating and deposing H., and absolving his subjects from all future obedience towards him. The king at first made light of the sentence, but when he found his vassals and princes gradually falling away from their allegiance, while the electors held a diet in which they declared that unless the ban were removed within a twelvemonth, they would deprive him of the crown, he submitted; and accompanied only by his faithful consort and their eldest son, he hastened, under grievous difficulties, in midwinter, to Italy, where he sought the pope. For three days in January 1077, H., barefooted, and clothed only in the haircloth shirt of a penitent, was compelled to stand without the castle gates of Canossa, exposed to the inclemency of the weather, before the pontiff consented to remove the ban of excommunication.

After this event, H.'s courage and resentment speedily revived; and having found adherents among the Lombards, he began a conflict against the papal power, chiefly in regard to the right of investiture, in which he was generally successful. Gregory again excommunicated H., who, as usual, retaliated by electing a new pope, Clement III. Hastening over the Alps, he laid siege to Rome. Gregory took refuge in the castle of St Angelo, and H. caused himself to be crowned emperor by the anti-pope; but finding that Hermann of Luxemburg had, during his absence, been elected king of Germany, he hastily left Rome to regain his lost power. For the third time H. crossed the Alps in 1090, and he had already succeeded in raising the fortunes of his friend, Clement III., taken Mantua, and gained many victories over the Guelfic princes and their favourite pope, Urban II., when he suddenly learned that his son Conrad had joined his enemies, and been crowned king at Monza. H.'s despair on hearing of these acts of rebellion nearly unsettled his reason, and having retired to one of his Lombard castles, he remained for several years in seclusion; but at length rousing himself from his lethargy, he returned in 1096 to Germany, where the princes and people now vied with one another to shew him their sympathy and good-will. By his own request, his second son, Henry, was elected king of the Germans, and his successor in the empire. This prince, however, having been induced to rise against his father by Pope Pascal II., took him prisoner, and forcibly compelled him to abdicate. The emperor escaped from his prison, and found friends and safety at Liege, where he died, August 7, 1106, while preparing another army to continue the struggle. See, for the lives of Henry III. and IV., Adamus Bremensis, *Historia Ecclesiastica*; Sismondi, *Italian Republics*; and *Europe during the Middle Ages*;

Schmidt, *Histoire des Allemands*; Sötl, *H. IV. Kaiser und König der Deutschen*.

HENRY, surnamed THE NAVIGATOR, a famous Portuguese prince, the fourth son of John I., king of Portugal, was born at Oporto in 1394, and first distinguished himself at the conquest of Ceuta in 1415. After the death of his father, he took up his residence at the town of Sagres, in Algarve, not far from Cape St Vincent; and while prosecuting the war against the Moors of Africa, his sailors reached parts of the ocean which the navigation of the time had long supposed to be inaccessible. The grand ambition of H. was the discovery of unknown regions of the world. At Sagres he erected an observatory, to which he attached a school for the instruction of youthful scions of the nobility in the sciences necessary to navigation. Subsequently, he despatched some of his pupils on voyages of discovery, which resulted at last in the discovery of the Madeira Islands in 1418. H.'s thoughts were now directed towards the auriferous coasts of Guinea, of which he had heard from the Moors; and in 1433, one of his mariners sailed round Cape Nun, until then regarded as the furthest point of the earth, and took possession of the coasts as far south as Cape Bojador. Next year, H. sent out a larger ship, which reached a point 120 miles beyond Cape Bojador; and at last, in 1440, Cape Blanco was reached. Up to this period, H. had borne all the expense of these voyages himself; henceforth, self-supporting societies were formed under his patronage and guidance, and what had formerly been the affair of a single individual, now became the passion of a whole nation. But H. did not slack personally in his efforts. In 1446, his captain, Nuno Tristan, doubled Cape Verd in Senegambia, and in 1448, Gonzalez Vallo discovered three of the Azores. H. died in 1463, after he had the satisfaction of learning that his mariners had reached as far south as Sierra Leone. See Wappäus, *Untersuchungen über die Geogr. Entdeckungen der Portugiesen unter H., dem Seefahrer* (Gött. 1842). See also Barros and Candido Lusitano, whose *Vida do Infante don Henrique* was translated into French by the Abbé Cournaud (Paris, 2 vols. 1731).

HENRY, surnamed THE LION, Duke of Saxony, is the most notable German prince of the 12th century. He was the son of Henry the Proud, and was born in 1129. When only ten years of age, he lost his father by poison, and for the next seven years, his mother, Gertrude, and his grandmother, Richenza, ruled his paternal dominions, while his uncle, Welf (Guelf), administered the hereditary fiefs of Bavaria. In 1146, Henry himself took the reins of government, and at the diet of Frankfurt, in the following year, he demanded of the Emperor Conrad the restoration of the whole duchy of Bavaria, which had been wrested from his father. This was refused, and Henry at once, in concert with his uncle, had recourse to arms; but his efforts were crushed by the energetic measures of Conrad. After the death of this emperor, however, Bavaria was given up to him by his cousin, the Emperor Frederick I. His possessions now extended from the North Sea and the Baltic to the shores of the Adriatic. Eastphalia and Westphalia, with Engern, and the old duchy of Saxony from the Rhine to the Elbe, acknowledged his authority. The greater part of Bavaria belonged to him as a hereditary fief, while his Italian vassals in the Guelfic dominions beyond the Alps took the oath of allegiance to him in 1157. In 1166, under the direction of Hartwig, Archbishop of Bremen, a league, comprising the bishops of Magdeburg, Halberstadt, and Hildesheim, and the markgrafs

of Thuringia and Brandenburg, was formed against him; but the capture of Bremen, and the storming of Oldenburg by H., paralysed its designs. About this time he separated from his first wife, and married Matilda, daughter of Henry II. of England, soon after which event he undertook an expedition to Palestine. During his absence, his enemies were not idle, and even the Emperor Frederick displayed a decided want of good faith, conduct which H., some time after his return, shewed he had not forgotten, by quitting the imperial army during an Italian campaign, and thereby causing Frederick to lose the battle of Legnano, and forcing him to conclude a disadvantageous treaty. The emperor was indignant, and at the diet of Spire, in 1178, spoke strongly against the duke. The numerous enemies of the latter again combined against him; he was summoned to appear at three different diets, and refusing, was put under the ban of the empire. By 1182 his fortunes were at so low an ebb, that he was forced to ask mercy of the emperor at Erfurt; but all that he could get was permission to retain his hereditary territories of Brunswick and Luneburg, and even this was on the condition of his going into exile for three years. H., in consequence, betook himself with his family to England, but returned to Brunswick in 1184, where he lived quietly. On the departure of Frederick for Palestine in 1188, H. was again necessitated to withdraw to England, but returned in 1189, and after a year's fighting, a peace was concluded between him and his enemies, by which a portion of his former territories was restored to him. He died at Brunswick in 1195. H. was a brave and generous prince, of indefatigable activity, but obstinate and passionate. What raised him above the princes of his time was his efforts to advance the commerce, industry, and comfort of his people, and to foster literature and science. Compare Böttiger's *Heinrich der Löwe Herzog der Sachsen und Baiern* (Hannov. 1819).

HENRY, MATTHEW, an eminent Nonconformist divine, the second son of Philip Henry, one of the 2000 ministers who left the Church of England on the passing of the 'Act of Uniformity,' was born at Broad Oak Farmhouse, in Flintshire, October 18, 1662. Having qualified himself for the ministry, he began to preach in June 1686, and in 1687 was settled as pastor of a congregation of dissenters at Chester, where he continued for 25 years. In May 1712, he removed to a charge at Hackney, near London, having refused two previous invitations from the same congregation. He died of apoplexy, June 22, 1714, while on his return from a visit to his old friends at Chester. He was twice married, and had a large family by his second wife. His principal work is an *Exposition of the Old and New Testament*, in 5 vols. folio, 1710, commenced in November 1704, and has been often reprinted. He lived to finish only the Acts of the Apostles. The remainder was completed by various ministers, whose names are given in some of the editions. His first publication, entitled *A Discourse concerning the Nature of Schism*, 34 pages duodecimo, appeared anonymously in 1689. He was also the author of a biographical sketch of his father, 1696; *A Scripture Catechism*, 1702, 8vo; *Communicant's Companion*, 1704, 8vo; *Discourses against Vice and Immorality*, 1705; *A Method of Prayer*, 1710, 8vo; *Family Hymns*; numerous sermons; and some religious tracts. His miscellaneous works were republished at London in 1830, 8vo.

HENRY, PATRICK, an eminent American orator, was born in Hanover county, Virginia, in 1736. His father was a native of Scotland, and a nephew of Robertson, the celebrated historian. In early

life, H. was passionately addicted to angling and hunting, and seemed too indolent to apply himself to any regular occupation. He managed, however, to pick up a good deal of general information, and he seemed to possess by intuition a profound knowledge of human nature in all its various phases. Having failed successively in 'store-keeping' and in farming, he at length was induced to try the profession of law. For a few years this seemed to promise no better success than his former occupations had done, but having been employed in 1755 to plead the cause of the people against an unpopular tax, his peculiar talent seemed suddenly to develop itself; his eloquence, untaught except by the inspiration of native genius, thrilled the audience, and held it in rapt attention more than two hours. From that moment to the present day he has been universally regarded as the greatest of American orators. He was a zealous patriot in the war of the revolution, and was one of the most prominent and influential members of the Virginia legislature, when that state was deliberating whether or not to join Massachusetts in forcibly resisting the arbitrary policy of the home-government. H. was a delegate to the first general Congress, which met at Philadelphia in September 1774, and his voice was the first to break the silence of that assembly. His eloquence on that occasion is said to have astonished all his hearers. In 1776, he was elected governor of Virginia, and was afterwards twice re-elected. In 1795, Washington appointed him secretary of state. He died in 1799.

HENRY, ROBERT, D.D., a Scotch historian and divine, was born at St Ninians, in Stirlingshire, February 18, 1718. He studied at the university of Edinburgh; and from 1768 till his death in 1790, was one of the ministers of the Established Church in that city. His *History of Great Britain on a New Plan*—the first volume of which was published in 1771, and the sixth in 1793, after his death—is a respectable performance, and the 'new plan' on which it professes to be written—viz., that of embracing the social aspects of successive periods, and thus tracing the progress of civilisation in Great Britain—was unquestionably an improvement on anything that had been done before; but the work has no pretensions to critical acumen or even strict accuracy, and consequently is now of little value.

HENRY, WILLIAM, F.R.S., an eminent chemist, was born in 1774 in Manchester, and died in 1836 at Pendlebury near that city. After studying medicine in the Manchester Infirmary, under the guidance of Drs Percival and Ferriar, H. attended the lectures of Black, Gregory, &c., in Edinburgh, in the session 1795—1796. After an interval of several years, in which he was chiefly engaged in superintending a chemical business which had been established by his father, he returned to Edinburgh in 1805, and received the degree of Doctor of Medicine from that university in 1807. From that time till shortly before his death, he devoted himself to the allied subjects of chemistry and medicine. He was the author of nine papers in the *Philosophical Transactions* (chiefly on the chemistry of the gases); and his *Elements of Experimental Chemistry*, in two volumes, which was published in 1799, reached an eleventh edition in 1829, an almost unparalleled success for a purely scientific work. H., like Dr Wollaston, made the results of science, obtained by the most original and difficult researches, the foundation of a splendid fortune, and few persons have contributed more effectually by the application of their discoveries to the promotion of the arts and manufactures. The

Memoirs of the Manchester Society are chiefly indebted to him and to Dalton for their high scientific character.

HEP'AR (Gr. *hepar*, the liver) is the name given by the older chemists to various compounds of sulphur, from their brown, liver-like colour; of these, *Hepar sulphuris*, which is in reality a mixture of tersulphide of potassium and some oxyalts of potash, is the best known.—HEPATIC, belonging to the liver; as, *hepatic artery*, vein, duct, &c.—HEPATICA. This term has been given by writers on *materia medica* to medicines which affect the liver and its appendages. The hepatica may be employed (1) to modify the secretion of bile; (2) to remove pain of the liver or gall-bladder, or pain and spasm of the gall-ducts; or (3) to relieve enlargements and other affections of the liver.

HEPATICÆ, or LIVERWORTS, a natural order of cryptogamous plants, included among mosses by the older botanists. They have generally a leafy stem; more rarely they are expanded into a leaf-like form. The reproductive organs are of two kinds, *antheridia* and *pistillidia*, as in mosses; the spore-cases (capsules, matured pistillidia) have no operculum; open when ripe by 4—8 valves, more rarely by teeth; and generally contain, along with the spores, spiral filaments called *elaters*. Each elater consists of two spiral fibres, which, whilst the spore-case is unbroken, remain coiled up together within an oval cell; but when, by the breaking of the mature spore-case, the outer pressure is removed, their elasticity bursts their cells, and as they suddenly extend themselves, they aid in the dispersion of the spores. The H. are found in situations generally similar to those of mosses; and are widely distributed over the globe; but the greater number belong to warm climates, where they often grow on the bark, and even on the leaves of trees. Some botanists divide H. into three orders, *Jangermanniaceæ*, *Marchantiaceæ*, and *Ricciaceæ*.

HEPATITIS (Gr. *hepar*, the liver), inflammation of the liver. Hepatitis is a rare disease in temperate latitudes, and in tropical climates is often so acute and so rapidly fatal as to admit but little of medical treatment. It is indicated by pain in the right side and shoulder, tenderness on pressure in the right hypochondrium (see ABDOMEN), with enlargement of the liver as detected by the hand and by percussion, often vomiting, always fever, with more or less loss of appetite and a foul tongue. Not unfrequently there is Jaundice (q. v.). The disease sometimes ends in abscesses, which may require to be opened externally. The treatment is complicated, and cannot be ventured upon without professional assistance. The other diseases of the liver will be treated of under LIVER, DISEASES OF.

HEPH'ESTUS. See VULCAN.

HE'PTAGON, a plane figure of seven sides and seven angles; when the sides and angles are equal, the figure is a *regular heptagon*. Geometers have

Elater and Spores of
Marchantia:
a, elater; b, spores.

hitherto failed to discover a method of inscribing the heptagon in, or of circumscribing it about a circle, and the problem is believed by many to be, like 'the trisection of an angle,' impossible of solution by the ancient geometry.

HEPTARCHY, *THE*, is the name given to seven kingdoms said to have been established by the Saxons in England. See **ANGLO-SAXONS**. The common idea is, that these seven kingdoms were contemporaneous; but all that can be safely asserted is, that England, in the time of the Saxons, was peopled by various tribes, of which the leading occupation was war; and that sometimes one was conquered, sometimes another. At no time was there a counterpoise of power among seven of them, so that they could be said to have a separate, much less an independent existence. Still, seven names do survive (some authorities adding an eighth). The king of the one that had the fortune to be most powerful for the time being, was styled *Bretwalda* or ruler of Britain, but in most instances the power of this supposed ruler beyond the limits of his own territory must have been very small. Under Egbert, Wessex rose to be supreme, and virtually swallowed up the others. The following is a brief account of the seven kingdoms commonly said to have formed the Heptarchy:

1. Kent, after the battle of Creccanford, in which 4000 Britons were slain, was abandoned by the Britons, and became the kingdom of their conquerors, a band of Jutes, who had come in 446 A.D. to serve Vortigern, king of the Picts, as mercenaries, under the leadership of Hengist and Horsa, who were little other than pirates. Hengist became king of Kent, and his son Eric or Aesc succeeded him, and from him his descendants, the kings of Kent, were called Aescingas. In 796, Kent was conquered by Cenwulf, king of Mercia; and about 823 both were conquered by Egbert, king of Wessex, who appointed his son Ethelwulf king of Kent, which hereafter, though separate in name, was really subordinate to Wessex.

2. Sussex, partially conquered about 477, and wholly, before 491, by Ella the Saxon, who was the first *bretwalda* of Britain. Sussex submitted to Egbert of Wessex in 823, and his son Athelstane governed it under him.

3. Wessex, though fluctuating in extent, as all the kingdoms did, included Surrey, Hants, the Isle of Wight, Berks, Wilts, Dorset, Somerset, Devon, and part of Cornwall. It was founded about 494 by Cerdic and Cynric his son, 'Ealdormen' or leaders of the 'old Saxons.' King Egbert, who returned from a flight to Gaul in 800, and ruled from that year till his death in 836, was, as a conqueror, the most successful of all these Saxon kings. When he died, his dominions were divided between his sons, Ethelwulf and Athelstane, the former taking Wessex Proper, and the latter Kent, Essex, Sussex, and Surrey. Another Athelstane, who succeeded in 925 to Mercia and Wessex, conquered Exeter, and assumed Northumbria, exacted tribute from the Welsh, and some formal submission from the Britons of the west, as well as the Danes and Scots. He appears occasionally to have held *witenagemotes* or Saxon parliaments of subordinate chiefs (*subreguli*), and at one of these, Constantine, king of Scotland, appeared as a *subregulus*. But Athelstane and his successors, as well as his predecessor, Alfred the Great, belong to the history of England, as indeed do all the Saxon states and kings after Egbert.

4. Essex, which comprised also Middlesex, if ever independent, was so about 530 A.D.; but early in the 7th c. it became subject to Mercia, and fell with it to Wessex in 823. This state and Sussex

and Wessex were founded by the old Saxons; the remaining three by the Angles who came from Holstein, and gave their name to England.

5. Northumbria consisted of Bernicia and Deira, which were at first separate and independent states. The former comprised Northumberland and all Scotland south of the Forth, and was founded by Ida about 560. The latter comprised Cumberland, Durham, York, and Lancaster, and was founded by Ella the Angle about the same date. These two were united about 655, and as Northumbria, they submitted to Egbert in 829.

6. East Anglia, comprising Norfolk, Suffolk, and Cambridge, was founded about 571 by Uffa, and from him its kings were named Uffingas. In 883, it was conquered by the Danes, and was only restored to Saxon rule by Athelstane in 925.

7. Mercia included the counties in the centre of the kingdom, and is said to have been founded by Crida or Creoda in 535. Three-quarters of a century later, it was conquered for a time by Northumbria, but it recovered its independence, and retained it until Egbert subdued it. Canute the Dane had it and Northumbria ceded to him in 1016, just before Edmund Ironside's death allowed him to become king of England, and the Danes to obtain the ascendancy over the Saxons, for which they had been striving, at intervals, for five generations. Compare *Strgrave's Rise and Progress of the English Commonwealth* (2 vols. Lond. 1832).

HERA. See **JUNO**.

HERACLEIA, an ancient city of Magna Græcia, situated on the right bank of the Aciris (the modern Agri), about three miles above the mouth of that river in the Gulf of Tarentum. It was founded about 432 B.C., and although under the Romans it became a prosperous, important, and refined city, it never acquired any historical prominence. When it fell into decay, is not known, but at the present day little more remains to mark its site than heaps of rubbish. In the neighbourhood, besides a large number of coins, ranking among the very finest relics of antiquity, there have been discovered certain bronze tables, known as the *Tabule Heracleenses*, containing a copy of the *Lex Julia Municipalis* (45 B. C.), and forming one of the principal authorities for a knowledge of the municipal law of ancient Italy. This inscription has been published by Muratori, Savigny, and others.

HERACLEIDÆ. This term means, in its widest sense, all 'the descendants of Heracles' (Hercules), of whatever time, and in whatever district of Greece, but is specially applied to those adventurers who, founding their claims on their supposed descent from the great hero (to whom Zeus had promised a portion of the land), joined the Dorians in the conquest of the Peloponnesus. There were five different expeditions, the last and greatest occurring eighty years after the Trojan war. The leaders of this last were Temenus, Cresphontes, and Aristodemus, sons of Aristomachus. They defeated Tisamenus, son of Orestes, and grandson of Agamemnon, and thus gained possession of Argos, Sparta, and Mycenæ. The other parts of the country quickly submitted to them, and they then proceeded to divide the spoil. Argos fell to Temenus; Lacedæmon to Procles and Eurystheus, the sons of Aristodemus; and Messenia to Cresphontes. This story of the return of the Heracleidæ touches on the historical period, and though there is much of fable and tradition, yet there seems to be also a large substratum of truth in the records.—See Müller's *Dorians*, Thirlwall's and Grote's *Greece*.

HERACLEITUS, a Greek philosopher, was born at Ephesus, in Asia Minor, and flourished about 500

B.C. He is said to have travelled much, and to have been very sorrowfully impressed with the weaknesses of his fellow-creatures, whence, according to old traditions, he obtained the nickname of the 'weeping philosopher,' in contrast to Democritus, 'the laughing philosopher.' He died at the age of 60. The result of H.'s researches and meditations was a work on the nature of things, said to have been entitled *Peri Physicōs* (On Nature). Such fragments of it as remain were collected and elucidated by Schleiermacher in Wolf and Buttmann's *Museum der Alterthumswissenschaften* (vol. i. part 3, Berlin, 1805). From these, it appears that he considered fire to be the first principle of all phenomena, and the original substance out of which they have all been evolved. H. was neither a very original nor a very coherent thinker, and his speculations deserve little attention.

HERACLIUS, a Byzantine emperor (610—641), of splendid but fitful genius, was descended from a line of brave ancestors, and was born in Cappadocia about 575 A.D. His father, also named Heraclius, was exarch or governor-general of Africa. Regarding H.'s youth we know almost nothing; but when upwards of thirty, he took part in a conspiracy (which proved successful) against the emperor Phocas, whose horrible cruelties had made him universally detested. In 610, H., at the head of a fleet, appeared at Constantinople: the citizens rose in rebellion, Phocas was beheaded, and H. saluted emperor in his stead. His fellow-conspirators were richly rewarded. The condition of the Byzantine empire at this time was deplorable. Factions within and the barbarians without had almost reduced it to ruin, so that years elapsed before H. could put forth any vigorous efforts for its reorganisation. His most powerful enemies in the north were the Avari, who, in 619, plundered the country to the very gates of Constantinople, nearly captured H. himself, and are said to have carried with them to their homes beyond the Danube 250,000 prisoners. The whole western empire had by this time been seized by the Slaves, Lombards, Visigoths, and other tribes; but by far the most alarming conquests were those made in the East by the Persian king, Chosroës II. In 615, Sarbar, the Persian general, stormed and plundered Jerusalem. The same fate befell Alexandria in the following year, after which all Egypt yielded to the victorious Sarbar, who penetrated as far as Abyssinia. By stopping the export of corn from Egypt to Constantinople, he likewise caused a severe famine in the latter city. In the same year (616), the Persians besieged and captured Chalcedon, opposite Constantinople. H. at first tried to negotiate with his enemies, but flushed with their triumphs, they refused, and even put his ambassadors to death. Probably, the emperor, who was now laying his plans for taking a magnificent revenge on the Persians, was not greatly displeased at their refusal. Having, after a whole year of laborious discipline, organised an army composed of Greeks and barbarians, he, in 622, shipped his troops at the Bosphorus, and sailed for Cilicia. Having landed, he encamped in the plain of Issus, completely routed a Persian army despatched against him, and forced his way through the passes of the Taurus and Anti-Taurus, into the province of Pontus, where his soldiers wintered. In 624, he crossed Armenia, conquered several of the Perso-Caucasian countries, and reached the Caspian Sea. Here he formed an alliance with the khan of the Khazars, who ruled over the sterile regions north of the Caucasus, as far as the river Ural. By the assistance of these and other barbarians, he attacked Media, and carried his arms as far south as Ispahan. Before going into winter-quarters, he again utterly

defeated the main body of the Persians, commanded by Chosroës himself. In 625, H. descended from the Caucasus into Mesopotamia, and thence proceeded into Cilicia, where a sanguinary engagement took place between him and Sarbar; the Persians were routed with immense slaughter, and Sarbar fled to Persia. During the next two years (626—628), the glory of H. culminated. He carried the war into the heart of the Persian empire, and in December 627, cut to pieces the forces of Rhazates, the Persian general, near the junction of the Little Zab and the Tigris. An immense booty fell into the hands of the victors. A few days after, H. took Artemita or Dastagerd, the favourite residence of Chosroës, and here the Arabic historians exhaust hyperbole in attempting to state the enormous treasure which the Byzantine emperor captured. Chosroës fled into the interior of Persia, and was soon afterwards seized, imprisoned, and starved to death by orders of his son and successor Siroes, who was glad to conclude a peace with H., by which the Persians gave up all their former conquests. The fame of H. now spread over the whole world, and ambassadors came to him from the remotest kingdoms of the East and West; but a new and terrible enemy suddenly arose in the South. The Arabs, filled with the ardour of a new and fierce faith, had just set out on their career of sanguinary proselytism. The war begun during the life of the Prophet himself, was continued by his successors, Abubekr and Omar. H. no longer commanded the Byzantine forces himself, but wasted his days in his palace at Constantinople, partly in sensual pleasures, and partly in wretched theological disputations. His mighty energies were quite relaxed; and before the close of his life, Syria, Palestine, Mesopotamia, and Egypt were in the hands of the califs. H. died in 641.

HERALD (derivation uncertain), an officer whose duty consists in the regulation of armorial bearings, the marshalling of processions, and the superintendence of public ceremonies. In the middle ages, heralds were highly honoured, and enjoyed important privileges; their functions also included the bearing of messages, whether of courtesy or defiance, between royal or knightly personages; the superintending and registering of trials by battle, tournaments, jousts, and all chivalric exercises; the computation of the slain after battle; and the recording of the valiant acts of the falling or surviving combatants. The office of herald is probably as old as the origin of coat-armour. The principal heraldic officers are designed kings-of-arms or kings-at-arms, and the novitiates or learners are styled pursuivants. Heralds were originally created with much ceremony; they are now appointed by the Earl Marshal in England, and by the Lyon King-of-Arms in Scotland. There are now in England three kings-at-arms, named by their offices Garter, Clarenceux, and Norroy; six heralds—Somerset, Chester, Windsor, Richmond, Lancaster, and York; and four pursuivants, called Rouge Dragon, Portcullis, Blue Mantle, and Rouge Croix. The heralds have no official connection with the districts from which they take their titles, and there have been at different periods other heralds, whose titles are now laid aside; heralds extraordinary have also sometimes been created, as Edmonson, by the title of Mowbray, in 1764. In Scotland, the principal heraldic officer is the Lyon King-at-arms; and there are six heralds—Snowdon, Albany, Ross, Rothesay, Marchmont, and Ilay; and six pursuivants—Unicorn, Carrick, Kintyre, Ormond, Dingwall, and Bute. Ireland has one king-at-arms, Ulster; two heralds, Cork and Dublin; and two pursuivants, of whom the senior bears the title of Athlone, and the other is called the pursuivant of St Patrick.

The official costume of a herald consists of an embroidered satin tabard or surcoat of the royal arms, and a collar of SS. See KING-AT-ARMS, PURSUIVANT, HERALDS' COLLEGE.

HERALDRY is properly the knowledge of the whole multifarious duties devolving on a herald (see HERALD); in the more restricted sense, in which we shall here consider it, it is the science of armorial bearings. After occupying for ages the attention of the learned, and forming an important branch of a princely education, the study of heraldry fell, in later times, into neglect and disrepute, and was abandoned to coach-painters and undertakers, a degradation owing in part to the endless tissue of follies and mystifications that had been interwoven with it. Modern criticism has rescued heraldry from the pedantries and follies of the heralds, and imparted to it a new interest, as a valuable aid to historical investigations.

Though we have instances in remote times of nations and individuals distinguishing themselves by particular emblems or ensigns, nothing that can properly be called armorial bearings existed before the middle of the 12th century. The shields of the French knights in the first crusade presented a plain face of polished metal, nor is there any evidence of heraldic devices having been in use in the second crusade in 1147. But the Anglo-Norman poet Wace, who flourished in the latter part of the 12th c., mentions devices or cognizances as being in use among the Normans, 'that no Norman might perish by the hand of another, nor one Frenchman kill another;' and Wace is curiously corroborated by the Bayeux tapestry of the 12th c., where there are figures of animals on the shields of the invaders, while the Saxon shields have only borders or crosses. The rude devices on these shields have nothing approaching to an armorial form or disposition, yet it is probable that systematic heraldry sprang out of them, but it is difficult to say when they assumed that hereditary character which is essential to the idea of armorial bearings. Some sort of armorial insignia were depicted on the shields used in the third crusade, which took place in 1189; and in the same half century originated the fleurs-de-lis of France and the lions of England. The transmission of arms from father to son seems to have been fully recognised in the 13th c., and in the practice then introduced of embroidering the family insignia on the surcoat worn over the hauberk or coat of mail, originated the expression *coat of arms*. Arms were similarly embroidered on the jupon, cyclas, and tabard, which succeeded the surcoat, a practice which survived till the time of Henry VIII., when the tabard came to be entirely disused except by heralds, who still continue to wear on their tabards the royal arms.

It was by slow degrees that the usage of arms grew up into the systematised form which it assumes in the works of the established writers on heraldry. The principal existing data for tracing its progress are English rolls of arms yet extant of the times of Henry III., Edward I., and Edward III. The earliest formal treatises date no further back than the end of the 14th c., before which time the whole historical part of the subject had been obscured by a tissue of gratuitous fictions, which has misled most subsequent writers up to a very recent period. The professors of the science represent the heraldry of the 10th and 11th centuries as equally sharply defined with that of the 15th and 16th. The arms of William the Conqueror and his sons are described with all their differences; arms are ascribed to the Saxon kings of England, to Charlemagne, and even to half-mythical persons and heroes of classical times. It is rather surprising to find this fictitious

heraldry understood and systematised early in the 14th century. The arms traditionally considered to be those of Edward the Confessor were sculptured in Westminster Abbey in the reign of Edward II.

In the infancy of heraldry, every knight assumed what arms he pleased, without consulting sovereign or king-at-arms. Animals, plants, imaginary monsters, things artificial, and objects familiar to pilgrims, were all fixed on; and whenever it was possible, the object chosen was one whose name bore sufficient resemblance in sound to suggest the name or title of the bearer of it. There is reason to believe that early arms were generally *armes parlantes*, though the allusion has in many cases ceased to be intelligible from the old name of the object being forgotten. The charge fixed on was used with great latitude, singly or repeated, or in any way which the bearer chose, or the form of his shield suggested. But as coats of arms became more numerous, confusion often arose from different knights adopting the same symbol; and this confusion was increased by a practice which crept in of sovereigns or feudal chiefs allowing their arms, or part of them, to be borne as a mark of honour by their favourite followers in battle. Hence different coats of arms came in many instances so closely to resemble each other, that it was imperative, for distinction's sake, that the fancy of the bearer should be restrained, and regulations laid down regarding the number and position of the charges, and the attitudes of the animals represented. This necessity led, in the course of time, to the systematising of heraldry, a process which the rolls alluded to shew us was going on gradually throughout the 13th and 14th centuries. By the time that heraldry was consolidated into a science, its true origin had been lost sight of, and the credulity and fertility of imagination of the heralds led them to invest the most common charges with mystical meanings, and to trace their original adoption to the desire of commemorating the adventures or achievements of the founders of the families who bore them. The legends ascribing an origin of this sort to the early armorial bearings have, in nearly all instances where it has been possible to investigate them, turned out to be fabrications. It was only when heraldry began to assume the dignity of a science, that augmentations of a commemorative character were granted, one of the earliest known instances being the heart added to the coat of Douglas, in commemoration of the good Sir James's pilgrimage with the heart of King Robert. After the science became thoroughly systematised, augmentations and new coats were often granted with a reference to the supposed symbolical meanings of the charges.

In England, the assumption of arms by private persons was first restrained by a proclamation of Henry V., which prohibited every one who had not borne arms at Agincourt to assume them, except in virtue of inheritance or a grant from the crown. To enforce the observance of this rule, heralds' visitations or processions through the counties were instituted, and continued from time to time till the reign of William and Mary. See VISITATION OF ARMS.

Jurisdiction in questions of arms is executed by the Heralds' College in England, the Lyon Court in Scotland, and the College of Arms in Ireland. No one within the United Kingdom is entitled to bear arms without a hereditary claim by descent, or a grant from the competent authority; and the wrongful assumption of arms is an act for which the assumer may be subjected to penalties. See HERALDS' COLLEGE, and LYON COURT. The use of arms, whether rightfully or wrongfully, subjects the bearer of them to an annual tax. It is illegal to use without authority not only a coat of arms,

but even a crest. Any figure or device placed on a heraldic wreath (see **WREATH**) is considered a crest in questions with the Heralds' College or Lyon Court, as well as in questions with the Commissioners of Inland Revenue. It shews how deeply the passion for outward distinction is implanted in human nature, when we find people in countries such as the United States, where all differences of rank are theoretically repudiated, assuming heraldic devices, each man at his own hand.

Besides individuals, communities and states are entitled to the use of arms, and heralds have classified arms, in respect of the right to bear them, under the following ten heads: 1. Arms of dominion; the arms borne by sovereigns as annexed to their territories. 2. Arms of pretension, which sovereigns have borne, who, though not in possession, claim a right to the territories to which the arms belong. Thus, England bore the arms of France from the time of Edward III. till 1801. 3. Arms of community; the arms of bishops' sees, abbeys, universities, towns, and corporations. 4. Arms of assumption; arms which one has a right to assume with the approbation of the sovereign. Thus, it is said, the arms of a prisoner at war may be borne by his captor, and transmitted by him to his heirs. 5. Arms of patronage; added by governors of provinces, lords of the manor, patrons of benefices, &c., to their family arms, as a token of superiority, right, or jurisdiction. 6. Arms of succession, borne quartered with the family arms by those who inherit fiefs or manors, either by will, entail, or donation. Thus, the Dukes of Athole, as having been lords of the Isle of Man, quarter the arms of that island, and the Duke of Argyll quarters the arms of the lordship of Lorn. 7. Arms of alliance, taken up by the issue of heiresses, to shew their maternal descent. 8. Arms of adoption, borne by a stranger in blood, to fulfil the will of a testator. The last of a family may adopt a stranger to bear his name and arms and possess his estate. Arms of adoption can only be borne with permission of a sovereign or king-at-arms. 9. Arms of concession; augmentations granted by a sovereign of part of his royal arms, as a mark of distinction, a usage which, we already observed, obtained in the earliest days of heraldry; and hence the prevalence among armorial bearings of the lion, the fleur-de-lis, and the eagle, the bearings of the sovereigns of England and Scotland, of France, and of Germany. 10. Paternal or hereditary arms, transmitted by the first possessor to his descendants.

A coat of arms is composed of charges depicted on an escutcheon representing the old knightly shield. The word escutcheon is derived from the French *écusson*, which signified a shield with armorial bearings, in contradistinction from *écu*, a shield generally. The shields in use in England and France in the 11th and 12th centuries were in shape not unlike a boy's kite, a form which seems to have been borrowed from the Sicilians; but when they became the recipients of armorial bearings, they were gradually flattened and shortened. From the time of Henry III., the escutcheon has been most frequently represented on seals as of something approaching to a triangular form, with the point downwards, the chief exceptions being that the shield of a lady is lozenge-shaped, and of a knight-banneret square. To facilitate description, the surface or field of the

Fig. 1.

escutcheon has been divided into nine points (fig. 1), technically distinguished by the following names: A, the dexter chief point; B, the middle chief; C,

the sinister chief; D, the honour or collar point; E, the fess point; F, the nombril or navel point; G, the dexter base point; H, the middle base; and I, the sinister base point. It will be observed that the dexter and sinister sides of the shield are so called from their position in relation not to the eye of the spectator, but of the supposed bearer of the shield.

Coats of arms are distinguished from one another, not only by the charges or objects borne on them, but by the colour of these charges, and of the field on which they are placed. The field may be of one colour, or of more than one, divided by a partition line or lines varying in form. The first thing, then, to be mentioned in blazoning a shield—that is, describing it in technical language—is the colour, or, as it is heraldically called, *tincture* of the field. Tinctures are either of metal, colour strictly so called, or fur. The metals used in heraldry are two—gold, termed *or*, and silver, *argent*—represented in painting by yellow and white. The colours are five—red, blue, black, green, and purple, known as *gules*, *azure*, *sable*, *vert*, and *purpure*. Metals and colours are indicated in uncoloured heraldic engravings by points and hatched lines, an invention ascribed to Father Silvestro di Petrasaneta, an Italian herald of the 17th century. *Or* (fig. 2) is represented by points;

Fig. 2.

for *argent*, the field is left plain. *Gules* is denoted by perpendicular, and *azure*, by horizontal lines; *sable*, by lines perpendicular and horizontal crossing each other; *vert*, by diagonal lines from dexter chief to sinister base; *purpure*, by diagonal lines from sinister chief to dexter base. The *furs* were originally but two, *ermine* and *vair*. The former is represented by black spots resembling those of the fur of the animal called the ermine, on a white ground. *Vair*, said to have been taken from the fur of a squirrel, bluish-gray on the back, and white on the belly, is expressed by blue and white shields, or bells in horizontal rows, the bases of the white resting on the bases of the blue. If the *vair* is of any other colours than white and blue, they must be specified. Various modifications of these furs were afterwards introduced, among others, *erminees*, or ermine with the field sable and the spots argent; *erminees*, with a red hair on each side of the black spot; *pean*, with the field sable, and the spots or; *counter-vair*, or *vair* with the bells of one tincture placed base to base; and *potent counter-potent*, *vair* with crutch-shaped figures instead of bells.

It is an established rule of heraldry that metal should not be placed on metal, nor colour on colour; a rule more rigidly adhered to in English than in foreign heraldry. We have one remarkable transgression of it in the arms of the kingdom of Jerusalem founded by the Crusaders, which are argent, a cross potent between four crosses or. A recognised exception exists wherever a charge lies over a field partly of metal and partly of colour, or where an animal is (see *infra*) attired, armed, unguled, crowned, or chained with a tincture different from that of his body. Marks of cadency, chiefs, cantons, and bordures are also occasionally exempted from

the general rule, being, according to some heralds, not laid on the shield, but *cousu* or sewed to it.

Everything contained in the field of an escutcheon is called a *charge*. Charges are divided by heralds into the three classes of honourable ordinaries, sub-ordinaries, and common charges. Under the name of ordinaries or *honourable ordinaries* are included certain old and very frequent bearings, whose true peculiarity seems to be that, instead of being taken from extraneous objects, they are representations of the wooden or metal strengthenings of the ancient shields. They are ten in number: 1. The *Chief* (fig. 3), the upper part of the shield separated from the rest by a horizontal line, and comprising, according to the requirements of heralds, one-third of it, though this proportion is seldom rigidly adhered to.

Figs. 3—14.

Its diminutive is the *fillet*, supposed to take up one-fourth the space of a chief, in whose lowest part it stands.

2. The *Pale* (fig. 4), a band or stripe from top to bottom, said, like the chief, to occupy one-third of the shield. It has two diminutives, the *Pallet*, one-half in breadth of the pale, and the *Endorse*, one-half of the pallet.

3. The *Bend* (fig. 5), a similar band crossing the shield diagonally from dexter chief to sinister base. Its diminutives are the *Bendlet* or *Garter*, one-half of its breadth; the *Cost* or *Cotise*, one-half of the bendlet; and the *Riband*, one-half of the cotise. The bend is sometimes borne between two cotises, in which case it is said to be *Cotised*, a term sometimes applied with doubtful propriety to the other ordinaries when accompanied with their diminutives.

4. The *Bend Sinister*, a diagonal band from sinister chief to dexter base. Its diminutives are the *Scarpe*, one-half of the bend sinister; and the *Baton* (fig. 6), one-half of the scarpe. The baton stops short of the extremity of the field at both ends, and has been considered a mark of illegitimacy. See *BASTARD BAR*.

5. The *Fess* (fig. 7), a horizontal band in the middle of the shield, said, like the ordinaries already enumerated, to occupy one-third of it. Its principal diminutive is the *Bar*, containing the fifth part of the field; and there are also the *Closet*, one-half of the bar, and the *Barrulet*, one-half of the closet, the latter seldom borne singly.

6. The *Chevron* (fig. 8), composed of two stripes descending from the centre of the shield in diagonal directions like the rafters of a roof. Its diminutives are the *Chevronel*, of half, and the *Couple-close*, one-fourth its width, the latter borne, as its name implies, in pairs, and generally accompanying the chevron—on each side of it.

7. The *Cross* (fig. 9), uniting the pale and fess,

an ordinary which was originally like the rest, composed of the clamps necessary to the strength of the shield, but had also the deeper meaning of the symbol of the Christian faith. Besides its plain form, the cross was varied in numerous ways, most of these varieties being, however, rather common charges than ordinaries. Of the 39 lesser crosses mentioned by Guillim, and 109 by Edmonson, a few of the most frequently occurring are the following: the *Cross moline* (fig. 10), with the ends turned round both ways; the *Cross fleury* (fig. 11), of which each limb terminates in a fleur-de-lis; the *Cross patonce* (fig. 12), each limb of which has three points; the *Cross potent* (fig. 13), crutch-shaped at the ends; the *Cross pattée* (fig. 14), small in the centre, but widening towards the ends; and the *Cross crosslet* (fig. 15), crossed at the ends. The latter is the most frequent of all, and borne oftener in numbers than singly. Any of these crosses is said to be *fitchée*, when the lower limb terminates in a sharp point, as in fig. 16. There is also the *Cross Maltese*, whose limbs have each two points, and converge to a point in the centre of the cross; though not

Figs. 15—22.

frequent as a heraldic charge, it derives an importance from being the badge of the Knights of Malta and of many other orders.

8. The *Saltire*, or St Andrew's Cross (fig. 17), formed by a junction of the bend dexter and bend sinister.

9. The *Pile* (fig. 18), a wedge with the point downwards. A single uncharged pile should, at its upper part, occupy one-third the breadth of the shield, but if charged, it may be double that width.

10. The *Quarter*, consisting of the upper right-hand fourth part of the shield cut off by a horizontal and a perpendicular line. Its diminutive is the *Canton* (fig. 19).

Armorial figures may be depicted on any of these ordinaries, but not on their diminutives, with the exception of the canton.

We observed that the field of an escutcheon may be of two different tinctures, divided by a partition-line, which line may vary in direction. When divided by a partition-line in the direction of one of the ordinaries, the shield is said to be *Party* per that ordinary; thus we may have (figs. 20) a shield party per pale, bend, fess, chevron, or saltire. An escutcheon divided as by a cross is said to be quartered. A shield divided into any number of parts by lines in the direction of a pale, bend, or bar, is said to be *Paly*, *Bendy*, *Barry*, the number of pieces being specified, as in the example fig. 21, barry of six, argent and gules. When the field is of a metal and colour separated by any of the lines of partition, and the charge placed on it is said

to be *Counter-changed*: this means that the part of the charge which is on the metal is of the colour, and *vice versâ*, as in fig. 22, the arms borne by Chaucer the poet, per pale argent and gules, a bend counter-changed.

The partition-line which bounds the field, or the boundary-line of an ordinary, is not always even. Fig. 23 represents the commonest forms of irregular partition-lines in use, viz., the *engrailed*, *invected*, *wavy*, *nebulé*, *embattled*, *indented*, and *dancetté*. An ordinary engrailed has the points of the engrailed line turned outwards, and an ordinary invected, inwards. Dancetté differs from the indented by the partition-line being marked with only three indentations.

Fig. 23.

The *Subordinaries*, or subordinate ordinaries, are, generally, enumerated as the following, though there is no very broad line of demarcation between them and the common charges.

1. The *Gyron*.—When a shield is at once quartered and party per saltire, as in fig. 24, the division is called *Gyronny of eight* (from *gyrus*, a circle), and one of the triangles, or at least the triangle in dexter chief, is a *gyron*. Gyronny of six, ten, or twelve also occasionally occur, so called according to the number of the triangles.

2. The *Fret* (fig. 25) is a cognizance derived from the banding or ornamenting of the shield, and a shield covered with this lattice-work decoration (fig. 26) is said to be *Fretty*.

3. The *Bordure*, or border (fig. 27), is a stripe encircling the shield. It is much used to distinguish different branches of a family, and is often

the upper and lower angles acute, and the others obtuse.

9. The *Fusil* (fig. 32), longer and more acute than the lozenge.

10. The *Rustre* (fig. 33), a lozenge pierced round in the centre.

11. The *Masle* (fig. 34), a lozenge perforated, and shewing a narrow border. Mascles were probably originally links of chain-armour.

A field is said to be *Lozengy* (fig. 35), *Fusilly* or *Mascally*, when divided by diagonal lines in the direction of these subordinaries. A field divided by horizontal and perpendicular lines into squares of different tinctures, is said to be *Checky*; in the case of a *Fess checky* there are three such rows of squares.

Among subordinaries are sometimes reckoned certain circular charges called *Roundels* or *Roundlets*, distinguished in English heraldry by different names according to their tinctures. When of or, they are called *Bezants*; of argent, *Plates*; of gules, *Torteaux*; of azure, *Hurts*; of purpure, *Golpes*; and of sable, *Ogresses* or *Pellets*.

We now come to the third class of figures occurring in armorial bearings. We have seen that the ordinaries and subordinaries are for the most part purely heraldic figures, connected in their origin with the shield itself; the *common charges*, on the other hand, are representations more or less conventional of familiar objects, which have no necessary relation to the shield; but are in some way emblematic as concerns family or individual history and character. The knights, in the early days of heraldry, ransacked the animal, the vegetable, and the mineral kingdom, as well as the range of things natural and artificial, for cognizances which would be distinctive, and at the same time suggestive, of the name or title of the bearer of them. We can only enumerate a few of the charges of most frequent occurrence.

Of beasts, the *lion* requires special mention. The king of beasts is one of the most frequent of heraldic devices, and is made to assume a great variety of attitudes, for which see *LION*. Lions and other beasts of prey are said to be *armed* or *langued* of any tincture when their teeth and claws, or their tongue, is of that tincture. With some change of colour or position, the royal beast came to be used by all who could claim kindred, however remote, with royalty, and lions were further multiplied by augmentations granted by the sovereign to favourite followers. The heraldic *leopard*, which has been the subject of much controversy, was originally but another designation for the lion passant-gardant. Bears, boars, bulls, stags, are favourite heraldic beasts. A stag walking is said to be *trippant*; he is at *gaze* when a lion would be *statant-gardant*; he is *attired* of any tincture when his horns are of that tincture. The animals that possess horns and hoofs are said to be *armed* and *unguled* in respect of them. The heads and limbs of animals are often borne as charges, and they may be either *couped*, cut off in a straight line, or *erased*, cut off with a jagged edge.

Of birds, we have first the *eagle*. The sovereign of birds, and symbol of imperial Jove, was, next to the lion, the most favourite cognizance of royal personages, and was adopted by the German emperors, who claimed to be successors of the Cæsars of Rome. The imperial eagle had at first but one head; the monstrosity of a second head seems to have arisen from a dimidiation of two eagles, to represent the eastern and western empire (see *MARSHALLING OF ARMS*). The eagle of heraldry is most generally *displayed*, i. e., its wings are expanded; sometimes it is *preying*, or standing devouring its prey. The *alerion*, the cognizance of

Figs. 24—35.

charged with small devices, on which account it has sometimes been reckoned an honourable ordinary.

4. The *Orle* (fig. 28) differs from a bordure in not touching the extremity of the shield.

5. The *Tressure*, regarded as a diminutive of the orle, is generally borne double, and flory counter-flory, as in the arms of Scotland, or, a lion rampant within a tressure flory counterflory gules (fig. 29).

6. The *Pall* (fig. 30), the archiepiscopal ornament of that name, sent from Rome to metropolitans, and resembling in form the letter Y.

7. The *Flanches* (fig. 31), the dexter and sinister sides of the shield cut off by a curved line. Flanches are always borne in pairs, and sometimes charged.

8. The *Lozenge*, a figure of four equal sides, with

the duchy of Lorraine, and the family of Montmorency, was originally but a synonym for the eagle assumed (M. Planché suggests) as an anagram for the word *Lorraine*, but modern heralds have degraded it into 'a nondescript creature without beak or claws. The *martlet* was originally a martin, a species of swallow, which has also in course of time been deprived by heralds of its legs and beak. The pelican, the swan, the cock, the falcon, the raven, the parrot or popinjay, and the peacock, are all of tolerably frequent occurrence. The pelican has generally her wings *indorsed*, or placed back to back, and is depicted pecking her breast. When in her nest feeding her young, she is called a pelican *in her piety*. A peacock borne affronté with his tail expanded, is said to be *in his pride*. Birds of prey are armed of the colour of which their beak and talons are represented. Such as have no talons are beaked and membered. The cock is said to be armed, crested, and jelloped, the latter term referring to his comb and gills. Birds having the power of flight are, in respect to their attitude, *close*, *rising*, or *volant*.

Fishes and reptiles occur as charges: the former are said to be *naïant*, if drawn in a horizontal, and *hauriant*, if drawn in a perpendicular position; and the dolphin, in reality straight, is conventionally borne embowed or bent. The scallop shell is of frequent occurrence, and said to be the badge of a pilgrim. Sometimes the conventional heraldic form of an animal differs from its true form, as in the case of the antelope of heraldry (fig. 36), which has the head of a stag, a unicorn's tail, a tusk issuing from the tip of the nose, a row of tufts down the back of the neck, and similar tufts on the tail, chest, and thighs. Of 'animals phantastical'

Fig. 36.

we have among others the gryphon, wyvern, dragon, unicorn, basilisk, harpy. We have the human body in whole or part, a naked man, a savage or wild man of the woods, also arms, legs, hearts, Moors' heads, Saracens' heads, and that strange heraldic freak, the three legs conjoined, carried in the escutcheon of the island of Man.

Of plants, we have *roses*, *trefoils*, *cinquefoils*, *leaves*, *garbs* (i. e., sheaves of corn), *trees*, often *erallicated* or *fructuated* of some other colour, and above all, the celebrated *fleur-de-lis*, used as a badge by Louis VII. of France before heraldry had an existence. When a plant, animal, or other charge is blazoned *proper*, what is meant is that it is of its natural colour.

The heavenly bodies, the sun, moon, and stars, are also pressed into the service of heraldry, as are things inanimate and artificial without number, particularly such as were familiar to the warriors and pilgrims of the twelfth and thirteenth centuries. Helmets, buckles, shields, hatches, horseshoes, swords, arrows, battering-rams, pilgrims' staves, mullets (or spur-rowels), and water-bougets, or bags, in which in crusading times water was carried long distances across the desert, also the clarion or war-trump, generally and erroneously called a *rest*. Even the letters of the alphabet have been used as charges.

Charges may be placed either simply on the field or on one of the ordinaries; in some instances, one of the ordinaries is placed over a charge, in which case the charge is said to be *debruised* by the ordinary. Three charges of one kind are placed two above and one below, unless blazoned *in fess* or *in pale*. In the fourteenth and fifteenth centuries, the simplicity of early heraldry began to be departed from by accumulating a variety of charges on one shield, and in later times we have sometimes a charge receiving another charge like an ordinary. The

growing complexity of shields arose from augmentations granted to distinguish the younger branches of a family, or charges assumed from the maternal coat by the descendants of an heiress. In the end of the last, and beginning of the present century, a practice prevailed for a time of introducing into armorial bearings matter-of-fact landscapes, representations of sea-fights, and of medals and decorations worn by the bearer, setting all heraldic conventionalities at defiance, and dealing in details not discernible on the minutest inspection. Such charges are frequent in the arms of the heroes of the old war; as, for example, in the augmentation granted to Sir Alexander Campbell, Bart., in addition to his paternal arms—viz., 'a chief argent charged with a rock proper, subscribed *Gibraltar*, between two medals; that on the dexter representing the silver medal presented to Sir A. Campbell by the supreme government of India, for his services at the storming of Seringapatam, in 1799; that on the sinister representing the gold medal presented to him for his services in the battle of Talavera.' The grants proceeding from the present kings of arms are more conformable to the usages of heraldry, and do not stand in need of such lengthened explanations to make them intelligible.

The arms of the different members of a family have been distinguished from one another, sometimes by the use of a bordure or other difference; and sometimes, especially by English heralds, by the use of certain figures called *marks of cadency*, the *label*, *crescent*, *mullet*, *martlet*, *annulet*, *fleur-de-lis*, to designate the eldest, second, third, fourth, fifth, or sixth son and his descendants—an invention originating about the time of Henry VII., but which cannot consistently be carried through all the ramifications of a family for a succession of generations. See CADENCY.

Blazonry is an essential part of the science of arms. To blazon a coat is so to describe it that any one with an ordinary knowledge of heraldry will be able to depict it correctly. In the language of blazonry, all tautology must be avoided. The tincture of the field is first mentioned; the ordinary, if any, follows, unless it be a chief; then the charges between which the ordinary is placed. The charges on the ordinary follow, and lastly we have a canton or chief, and marks of cadency. The rules of blazonry are given in the article BLAZONING OF ARMS.

Besides the heraldic devices depicted on the shield, there are the following borne external to it—the helmet, the mantling, the wreath, the crest, the motto and scroll, the supporters, and the coronet.

The *helmet*, originally a piece of defensive armour, became in the course of time one of the usual accompaniments of the shield; and placed over the arms, it came by its form to mark the rank of the wearer. For these distinctions, which are of comparatively recent date, and applicable only to British heraldry, see HELMET.

The *mantling* is an embellishment of scroll-work flowing down on both sides of the shield, and originating in the *cointoise*, or scarf, wrapped round the body in the days of coat-armour.

From the centre of the helmet, within a *wreath* of two pieces of silk of the two first colours of the armorial bearings, issues the *crest*, originally a special mark of honour worn only by heroes of great valour, or advanced to a high military command; now an inseparable adjunct of the coat of arms in English, though not in continental heraldry, and often assumed or changed arbitrarily without proper authority.

The *scroll*, placed over the crest or below the

shield contains a *motto*, bearing in many cases an allusion to the family name or arms.

Supporters are figures or animals standing on each side of the escutcheon, and seeming to support it. They were in their origin purely ornamental devices, which only gradually acquired a heraldic character. In England, the right to use supporters is confined to the royal family, peers, peeresses, and peers by courtesy, Knights of the Garter, Knights Grand Cross of the Bath, and a very few families whose ancestors bore supporters before their general use was restricted. In Scotland, supporters are also used by the baronets of Nova Scotia and the chiefs of various families.

The crown of the sovereign, the mitre of the bishop, and the coronet of the nobility, are adjuncts appended to the shield of those whose dignity and office entitle them to that distinction. For a description of the crown of Great Britain and the coronets of the royal family, see article CROWN. Under the articles DUKE, MARQUIS, EARL, VISCOUNT, and BARON, the coronets appropriated to the different ranks of the nobility are described.

The subject of *marshalling arms*, or arranging various coats in one escutcheon, is explained in a separate article. Here it may suffice to lay down a few general rules. A husband is entitled to *impale* the arms of his wife, i. e., to place them on the same shield side by side with his own. When the wife is an heiress, the husband bears her arms in an *escutcheon of pretence*, or small escutcheon in the centre of his own shield, and the descendants of the heiress may quarter her arms with their paternal coat. A sovereign also quarters the arms of his several states, and feudal arms are sometimes quartered by subjects. An elective king, it is said, may place his hereditary arms on an escutcheon of pretence over the insignia of his dominions.

For information on the details of heraldry, reference is made to the standard works of Guillim, Edmonson, and Nisbet; and for a more discriminating view of the subject, to such recent treatises as Montague's *Heraldry*, and Planché's *Pursuivant of Arms*.

HERALDS' COLLEGE, or COLLEGE OF ARMS, a collegiate body, founded by Richard III. in 1483, consisting of the heraldic officers of England, who were assigned a habitation in the parish of All-hallows-the-Less, in London. Various charters confirmed the privileges of the College of Arms, and it was reincorporated by Philip and Mary, who bestowed on it Derby House, on whose site in Doctors' Commons the present college was built by Sir Christopher Wren.

The presidency of the college is vested in the earl marshal, an office now hereditary in the family of Howard Duke of Norfolk; he nominates the three kings of arms, six heralds, and four pursuivants, who are the members of the collegiate chapter. Persons having a hereditary claim to arms, which has been disused for one or more generations, are empowered by the Heralds' College to resume them, on proof and registration of pedigree. A person who has no hereditary claim, and wishes a grant of arms, must memorialise the earl marshal, and shew that he is in a condition to 'sustain the rank of gentry.' An important department of the Heralds' College is the recording of pedigrees. Any pedigree shewing the existing state or descent of a family, may, if accompanied with sufficient evidence, be entered on the books of the college. The members of the college have salaries, but derive their principal income from fees charged for assistance in tracing pedigrees and titles, and for the granting and registration of arms. In Scotland, the corresponding functions belong to the LYON COURT (q. v.).

HERA'T, capital of the most westerly of the three divisions of Afghanistan, stands on the river Heri, at the height of 2500 feet above the sea. Lat. 34° 50' N., long. 62° 30' E.; distance from Cabul, 390 miles west. Situated near the boundaries at once of Afghanistan, Persia, and Independent Tartary, H. is one of the principal marts of Central Asia, carrying on at the same time extensive manufactures of its own in wool and leather. The vicinity, naturally fertile, has been artificially rendered much more so by means of irrigation. But the city claims notice mainly on political and military grounds. Long the royal seat of the descendants of Timur, and often a bone of contention between the warlike tribes all round, it is fortified by a ditch and wall, and is commanded on its north side by a strong citadel. In more modern times, the place has acquired a kind of European importance, being, towards Persia, the key of Afghanistan, which, again, in turn affords the only approach by land to Western India. In this connection, H. has been viewed as an outpost of England's eastern empire against Russian intrigue and encroachment. Hence, it has been alike the subject of treaties and the occasion of wars between Great Britain, as the mistress of Hindustan, and Persia, as virtually a vassal of Russia. This feature of the history of the city was more specially developed in connection with the last conflict between Persia and England. In November 1856, the Shah, regarded by the British government as the vassal and agent of the Czar, captured H., while actually conducting negotiations for an amicable adjustment at Constantinople; but he was within a few months, constrained to relinquish his prey and renounce his claims by a British expedition directed against the opposite extremity of his empire. According to different estimates, referring, however, to different epochs, the population has varied from 20,000 to 70,000.

HERAULT, a maritime department in the south of France, bounded on the south-east by the Gulf of Lyon; is oval in form, and is 84 miles in greatest length from east to west. Area, 2436 square miles; pop. (1872) 429,878. It is occupied in the north and north-west by the Lower Cevennes, from which several branches of moderate elevation run toward the south, gradually subsiding as they approach the sea. The principal rivers are the Hérault (from which the department derives its name), the Orb, and the Lez, which, rising in the Cevennes, pursue a generally southward course to the Mediterranean. The coast-line is about 66 miles in length; and along the shore, from Agde to the Vidourle, are numerous *étangs*, or marshy lakes, united by the Canal-des-Étangs, and communicating with the sea. In the neighbourhood of the *étangs*, the climate is unhealthy, especially in summer, when agues and fevers prevail; but elsewhere throughout the department it is unusually fine. About a fourth of the entire area consists of arable land, and about a sixth is under vineyards. The department of H. stands, for quantity at least, at the head of the wine-growing departments of France, 46,552,000 gallons being the average annual produce. From the shore-lakes and the sea, immense quantities of fish are obtained. Woollen, silk, and cotton fabrics, in great variety, are largely manufactured. Coal and copper mines, as well as quarries yielding variously veined marbles, building-stone, granite, &c., are worked. This department supplies a great quantity of the salt used in France. It is divided into four *arrondissements*. Montpellier is the capital.

HERBARIUM, the name usually given to a

collection of dried plants, intended for the future study and examination of botanists. For collecting plants, a box of tinned iron, called a *vasculum*, is generally used, which preserves most plants from withering for at least some hours. Plants intended for the herbarium should be collected on a dry day; plants which when gathered have moisture on their leaves, should, when brought home, be placed in a vessel of water, and there allowed to dry. Plants with thick succulent stems or leaves are immersed for a few seconds in hot water to kill them. The specimens are then laid between layers of blotting-paper, or of a thick bibulous kind of paper called botanical drying-paper, not spread out with anxious minuteness, nor so placed as to distort their parts. The number of sheets of paper in each layer is accommodated to the nature of the plants, and pressure is applied by means of weights, screws, or straps, the whole being enclosed in boards, and the layers of paper, when very numerous, having also boards occasionally interposed. Care must be taken that too much pressure be not applied at first, lest the parts of the plants be unfitted for future examination. For a short time, the paper is changed every day, or every second day, dry paper being supplied. Specimens have the best appearance which are quickly dried. Some plants which, in spite of all care, lose their natural colours in the ordinary method of drying, and become black, as orchids, may be beautifully dried by enclosing the layers of paper in a network wire-frame, and hanging the package before a fire, where it is turned round like meat roasting. Specimens are thus dried in a few hours, which otherwise would have required eight or ten days.—When the specimens are fully dried, they are laid within sheets of writing-paper, or they are gummed or glued to sheets of paper, the name of the species, with the locality, date of collection, and any other interesting particulars, being marked beside each. As much as possible of each plant is preserved in the herbarium, but the flower and leaf must always be exhibited. Some parts of plants, as succulent roots, fruits, &c., are otherwise preserved. The herbarium is arranged according to a botanical system. Care must be taken to preserve it from the ravages of moths and beetles by frequent inspection, by the aid of camphor, and by the occasional application of a little corrosive sublimate. There are herbaria in existence which are now some centuries old, and which are still consulted for the identification of species. The herbarium enables us to compare plants which flower at different seasons, and those of different countries. The herbaria formed by travellers have been of great importance to the progress of botany.

HERBART, JOHANN FRIEDRICH, a German philosopher, was born at Oldenburg, May 4, 1776. He was educated at Jena. At a very early age, he was familiar with religious and metaphysical doctrines and discussions, and at twelve years had read the systems of Wolff and Kant. He became the pupil of Fichte, and received his philosophy with enthusiasm; but after more reflection, he found himself obliged to reject much of his system, and to form one of his own. In 1805, he was appointed extraordinary professor at Göttingen; in 1809, he obtained the chair of philosophy at Königsberg, where he remained until 1833, when he returned to Göttingen, and enjoyed the dignities of titular professor and aulic councillor until his death, August 14, 1841. The school of philosophy he promulgated has (or had) its centres at Göttingen and Leipsic. His collected works were published, in 12 volumes, at Leipsic in 1850—1852.

The philosophical system of H. is neither very profound nor very original, but it has, what in

the eyes of many is no small merit, the quality of extreme obscurity. The total result of his metaphysical investigations may be thus briefly expressed: that the variety and change of the given phenomenal world are not to be explained by the hypothesis of a single reality, but of a plurality of such (*eine Vielheit des Realen* or *Monaden*). H. has made a fruitful application of his metaphysical doctrines to psychology, through the help especially of his great mathematical knowledge, and has endeavoured to shew the untenableness of the ordinary views regarding the soul, but his own speculations on the subject are anything but intelligible.

HERBELOT, BARTHÉLEMY D', a celebrated orientalist, was born in Paris, December 4, 1625, and finally became professor of Syriac in the College of France. He died at Paris, December 8, 1695. His celebrated work, the *Bibliothèque Orientale*, was published after his death by Galland (Paris, 1697), and afterwards with a supplement (Maestricht, 1776—1781); but the best edition is that published at the Hague (1777—1782, 4 vols.). It is unfortunate that H. was unable to give the finishing touch to a work which had cost him so much labour and research, and which, in spite of the errors, repetitions, contradictions, and omissions which one meets with, still bears a deservedly high character. In it we find an abridgment of the immense Turkish literary biography of Haji Khalefah, and numerous extracts from a multitude of Arabic, Turkish, and Persian authors, who have written on history, geography, religion, and the manners and customs of oriental nations, especially those who profess Islam; and the enormous labour the author must have undergone may be imagined when we consider that at least 150 of these works were in MS.

HERBERT. This name, which stands forth prominently upon the records of British history, has been ennobled at various times, in so many of its branches, by so many ancient and renewed creations, that it has become a matter of difficulty to ascertain with certainty which is the parent stem; though Sir Bernard Burke is inclined to give the representation of the House to the Right Honourable H. A. H., M.P., of Muckross, co. Kerry. It is certain that the Herberts came over to England in the train of William the Conqueror, for H., Count of Vermandois, who afterwards filled the post of chamberlain under William II., is mentioned in the Roll of Battle Abbey, and received from his sovereign a grant of lands in Hampshire. His wife Emma, daughter of Stephen, Count of Blois, was a granddaughter of the Conqueror, and his son H. (called in history H. of Winchester) was chamberlain and treasurer to King Henry I. Seven or eight generations later, we find the Herberts diverging into several distinct branches, including the lines of the Earls of Powis (now extinct in the male line), of the Lords H. of Cherbury (also extinct), the Herberts of Muckross (ancestors of the gentleman mentioned above), and also several untitled branches which have flourished upon their ancestral lands in England, Wales, and Ireland. In the reign of Henry V., Sir William H., of Raglan Castle, co. Monmouth, received the honour of knighthood in reward of his valour in the French wars. His eldest son, a staunch adherent of the House of York, was created Earl of Pembroke* by Edward IV. in 1469, but fell into the hands of the Lancastrians after the battle of Danes Moor, and was beheaded the following day, when the title became extinct. It was, however, revived in 1551,

* The earldom of Pembroke was originally conferred on Richard de Clare, the celebrated Strongbow, who aided Henry II. in the conquest of Ireland.

in the person of his (illegitimate) grandson, William H., K.G., one of the most influential noblemen of his age, and one who took an active part in public affairs, both as a statesman and as a soldier. It is recorded by Sir B. Burke, that 'he rode on February 17, 1552—1553, to his mansion of Baynard's Castle, with 300 horse in his retinue, 100 of them being gentlemen in plain blue cloth, with chains of gold, and badges of a dragon on their sleeves.' He was buried in Old St Paul's, and his funeral was conducted on such a scale of magnificence that, according to Stowe, the mourning given away on that occasion cost £2000—a very large sum in those days. By his wife, who was a sister of Catharine Parr (the last queen of Henry VIII.), he had a son Henry, second earl, K.G., to whose countess, Mary, daughter of Sir Henry Sydney, K.G., Sir Philip Sydney dedicated his *Arcadia*. She is celebrated by Ben Jonson in the well-known lines—

Underneath this marble hearse
Lies the subject of all verse—
Sydney's sister, Pembroke's mother.

The fourth earl, some time Lord Chamberlain to Charles I., and Chancellor of the university of Oxford, was the founder of Jesus College in that seat of learning. The eighth earl held several high offices under Queen Anne, including that of Lord High Admiral. From him the present Earl of Pembroke (George Robert Charles H., born in 1850) is directly descended. The late Lord Herbert (q. v.) of Lea—better known as Mr Sidney Herbert—was the younger brother of the late, and father of the present earl. The Earls of Carnarvon, more than one of whom have gained celebrity in the field of literature, descend from the eighth Earl of Pembroke mentioned above. The present Earls of Powis are descended from the same stock maternally, the only child and heiress of the last Earl of Powis of a previous creation having married the eldest son of the illustrious Robert Clive, the founder of our Indian Empire, in whose favour that title was renewed in 1804.

HERBERT, EDWARD, Baron H. of Cherbury, who is commonly reckoned the first of the English deistical writers, was born of a noble family in the year 1581, at Montgomery Castle, in North Wales. In his Autobiography, he has described his early love for inquiry and his scrupulous truthfulness. He was sent to Oxford in his twelfth year, and before he had quite quitted his studies, he married an heiress. On the occasion of the coronation of James I., he was made a knight, and invested with various offices. Although his marriage was happy enough, there appears to have been little warmth of affection between him and his wife, who was considerably older than himself. He left home, accordingly, for travel in France in 1608, and from this time resided very much abroad. In Paris, he lived on terms of intimacy with the Constable Montmorency, Jean Casaubon, and other distinguished men. After a brief return to his native country, he set out again in 1610 for the Low Countries, where he joined the arms of the brave Maurice of Orange. For this prince he contracted a great affection, and again offered him his services in 1614. After a campaign, he travelled through Germany and Italy on horseback, and went as far as Venice, Florence, and Rome. On his return, he got into trouble from an attempt which he made to raise a troop of Protestant soldiers in Languedoc for the Duke of Savoy. Shortly after, he returned to England, and proposed to devote himself to study and philosophical inquiry; but high and important diplomatic duties awaited him. He was made a member of the Privy Council, and sent to France

as extraordinary ambassador. His aim was to promote the alliance between France and England, and he was so far successful that he was appointed ordinary ambassador, and continued to reside at Paris. He tried, but without much success, the difficult task of negotiation between Louis XIII. and his Protestant subjects. He was elevated first to be a peer of Ireland, and then in 1630, five years after the accession of Charles I., to be a peer of England, with the title of Baron H. of Cherbury. When the civil war broke out, he appears to have acted with hesitation, at first siding with the parliament, and then joining the king. His hereditary seat, Montgomery Castle, was attacked and burned. He died in London in the year 1648.

The character of H., as depicted in his Autobiography, is in the main that of a gallant adventurer, equally fired with the love of arms and of arts, at once a soldier and a scholar. He is the gay man of the world, always truthful, honourable, and high-spirited; yet he has thoughts above those of the world; he ponders deeply the great questions of truth and religion, and has left us the result of his speculations in his two treatises, *De Veritate* and *De Religione Gentilium*. The reader will find an admirable analysis of the first and most important of these treatises in Hallam's Literary History. They are only interesting to the philosophical student, or to the inquirer into the history of religious opinion in England. H.'s position at the fountain-head of English deism gives them a peculiar significance. He is far, however, from being *sceptical*, in the modern sense of the term. His speculations are those of a philosophical dogmatist rather than of a critical inquirer. His arguments are abstract and deductive, and not analytical or negative. He offers solutions, rather than starts difficulties or obtrudes negations; and in this respect H. is rightly reckoned the first of English deists, the writings of all of whom partake more or less of the same character; although it is not easy to trace any links of direct connection between him and the outburst of deistical literature in the end of the 17th and beginning of the 18th century.

HERBERT, GEORGE, an English poet, and fifth brother of Lord Herbert of Cherbury (q. v.), was born in Montgomery Castle, Wales, on the 3d April 1593. He was educated at Westminster, and was sent to Trinity College, Cambridge, about 1608. In 1615, he was elected fellow; and in 1619, he was promoted to the office of public orator. At the university, he made the acquaintance of Lord Bacon; and in the hope of preferment, he was induced to spend a considerable portion of his time about the court. On the death of James I., he studied divinity, and finally took holy orders. He was made prebendary of Leighton Bromswold in 1626. He married in 1630; and in the same year, received the rectory of Bemerton. Two years after, at the early age of 39, he died of the effects of a quotidian ague. His principal poetical production, printed in 1633, a year after his death, is entitled *The Temple, or Sacred Poems and Private Ejaculations*, and, although disfigured by fantastic conceits, contains several passages of the purest pious verse which the language possesses. He wrote a prose work, *The Country Parson*, which lays down rules for the guidance of a clergyman's life, and which may be considered a pendant to *The Temple*. His life was written by Izaak Walton, and to that quaint and loving pen, even more than to his own *Temple Songs*, he owes his immortality.

HERBERT, LORD, OF LEA (SIDNEY HERBERT), minister and statesman, son of the eleventh Earl of Pembroke by his second wife, was born at Richmond

in 1810. Educated at Harrow and at Oriel College, Oxford, he devoted himself to public life, and entered the House of Commons in 1832 as member for South Wilts, which he represented until his elevation to the peerage in 1861. He began his political career as a Conservative, and was Secretary to the Admiralty in Sir R. Peel's administration from 1841 to 1845, when he became Secretary-at-war. As a member of this administration, it fell to him to oppose Mr Cobden's motion for a select committee to inquire into the effect of the corn-laws on farmers, and afterwards, to argue in support of free trade in corn. He went out of office with his party in 1846. In 1852 he was again Secretary-at-war, under the Aberdeen ministry, and, in consequence, the 'horrible and heart-rending sufferings' of the army before Sebastopol were laid in a great degree at his door. He was for a few weeks Colonial Secretary in the first administration of Lord Palmerston in 1855, and Secretary-at-war in his second administration in 1859. Great improvements in the sanitary condition and education of the army, the amalgamation of the Indian with the royal army, and the organisation of the volunteer force, signalised his army administration. He largely reformed the War-office, and was devoting himself with equal zeal and intelligence to his ministerial duties, when, owing to failing health, he resigned his seat in the House of Commons, and in 1861 was called to the Upper House, under the title of Baron Herbert of Lea. But release from labour came too late, for he died August 2, 1861. He was heir-presumptive to the twelfth Earl of Pembroke. He had great aptitude for business, winning and genial manners, great readiness and fluency in debate, and a boundless philanthropy. He was a liberal patron of the arts; and his Lombardian church at Wilton, near his splendid abbey-seat in Wiltshire, will remain a lasting monument of his taste and munificence. He married, in 1846, the daughter of Major-general A'Court, niece of the first Lord Heytesbury; and his eldest son, born in 1850, is now Earl of Pembroke and Montgomery.

HERBS, or HERBA'CEOUS PLANTS, in Botany, are those in which no persistent woody stem is formed above ground. In some, the stem is woody, but still annual. There is, however, in many a permanent woody *rhizome* or root-stock.—In books of gardening, plants used only for flavouring are sometimes distinguished as *sweet herbs*, as mint, basil, &c.; whilst those valued for their nutritive qualities are known as *pot herbs*.

HERCULANEUM, an ancient city of Italy, was situated at the north-western base of Mount Vesuvius, about five miles east of Naples. Considerable obscurity envelops its early history; it is supposed, however, to have been of Phœnician origin, and to have been occupied afterwards by Pelasgians and Oscans. It subsequently was conquered, with all the rest of Campania, by the Samnites, and later it fell into the hands of the Romans. In 63 A.D., the city was seriously injured by a violent earthquake; and in 79 it was buried, along with Pompeii and Stabies, by the memorable eruption of Vesuvius (q.v.) which took place in that year. It now lies at a depth of from 70 to 120 feet below the surface, and is filled up and covered with volcanic tufa, composed of sand and ashes, and consolidated to some extent by water, which is often thrown up in great quantities during volcanic eruptions. Above it, on the modern surface, are the two large villages Portici and Resina. In the latter, in 1706, on the occasion of deepening a well, fragments of mosaics were first brought up; but little was done in the

way of systematic excavation till 1738, when explorations were commenced under royal authority. It was then discovered that the building near the bottom of the well, from which the first relics were

Gate at Herculaneum.

obtained, was the theatre. This building was forthwith explored and cleared, and several statues, both in bronze and marble, were extracted from it. Excavations were carried on but to a limited extent, not only in consequence of the hardness of the tufa, but from the fear of undermining the dwellings on the surface. Hence visitors can see only a very small portion of this entombed city. The chief edifice shewn is the theatre, which had been very large, and was built but a short time before the fatal eruption. It has 18 rows of stone seats, and could accommodate 8000 persons. A basilica, two small temples, and a villa, have also been discovered; and from these buildings, many beautiful statues and remarkable paintings have been obtained. Among the art-relics of H., which far exceed in value and interest those found at Pompeii, may be mentioned the statues of Æschines, Agrippina, the Sleeping Faun, the Six Actresses, Mercury, the group of the Satyr and the Goat, the busts of Plato, Scipio, Africanus, Augustus, Seneca, Demosthenes, &c. These treasures, together with such vases and domestic implements as have been found, have been conveyed to the Museum at Naples. Latterly, the portion of H. towards the sea, which had been covered only by loose ashes, has been laid open, and ancient buildings are now seen there to advantage as at Pompeii. See *Something of Italy*, by W. Chambers, 1862.

HERCULES (Gr. *Herakles*), called likewise *Alcides*, after his grandfather Alcæus, was the son of Zeus and Alcmena, and the most celebrated hero of the Greek legends, the ideal of human perfection, as conceived in the heroic ages; i.e., the greatest physical strength, connected with every high quality of mind and character which these ages recognised. He had a bitter enemy in Hera, who, knowing that the child who should be born that day was fated to rule over all the descendants of Perseus, contrived to prolong the travail of Alcmena, who was the daughter of Alcæus, son of Perseus, and hasten that of the wife of Sthenelus, another son of Perseus, who, after a pregnancy of seven months, gave birth to a son, named Eurystheus. Eurystheus thus, by decree of Fate, became chief of the Perseidæ. Pindar and other subsequent writers relate, that, while yet in his cradle, H. shewed his divine origin by strangling two serpents sent by Hera to destroy him. By Amphitryon's care, he was instructed in all arts by the first masters. Amphitryon now sent him into the country, where he tended the flocks till he was 18 years of age. During this

period, as the Sophist Prodikos relates in his poem, H., meeting the goddesses of Pleasure and Virtue at the crossways, chose the latter to be the constant companion of his life.

His first exploit was the slaying of a lion, which haunted Mount Cithæron, and ravaged the dominions of King Thespius. H. was kindly received by the king, and at length succeeded in destroying the lion. On his return to his native city of Thebes, he not only freed it from the disgrace of having to pay tribute to the Orchomenians, but compelled them to pay double the tribute which they had formerly received. In return for this service, Creon, king of Thebes, gave him his daughter Megara in marriage. At this time, Eurystheus summoned H. to appear before him, and ordered him to perform the labours which, by priority of birth, he was empowered to impose upon him. H., unwilling to obey, went to Delphi to consult the oracle, and was told that he must perform ten labours imposed by Eurystheus, after which he should attain to immortality. This reply plunged H. into the deepest melancholy, which Hera increased to madness, so that he killed his own children by Megara. When he recovered his senses, he returned, submitted to Eurystheus, and addressed himself to the performance of the labours imposed upon him.—The first labour was to destroy the lion which haunted the forests of Nemea and Cleonæ, and could not be wounded by the arrows of a mortal. H. boldly attacked him with his club, but in vain; and he was finally obliged to strangle him with his hands. From this time, he wore the lion's skin as armour.—The second was to destroy the Lernaean hydra, which he accomplished with the assistance of his friend Iolaus; but because H. obtained assistance in this labour, Eurystheus refused to count it.—His third was to catch the hind of Diana, famous for its swiftness, its golden horns, and brazen feet.—The fourth was to bring alive to Eurystheus a wild boar, which ravaged the neighbourhood of Erymanthus.—The fifth was to cleanse the stables of Augeas, king of Elis, where 3000 oxen had been confined for many years, which he accomplished in one day, by turning the rivers Alpheus and Peneus through the stables. But as H. had gone to Augeas, and offered to perform this service on payment of a tenth of the cattle, and concealed the fact, that he had been commanded to perform it by Eurystheus, the latter, hearing of this, judged that it must not be counted as one of the labours.—His sixth was to destroy the carnivorous birds, with brazen wings, beaks, and claws, which ravaged the country near the lake Stymphalis, in Arcadia.—The seventh was to bring alive to Peloponnesus a bull, remarkable for his beauty and strength, which Poseidon, at the prayer of Minos, had given to Minos, king of Crete, in order that he might sacrifice it, which Minos afterwards refusing to do, Poseidon made the bull mad, and it laid waste the island. H. brought the bull on his shoulders to Eurystheus, who set it at liberty. It appears again as the Marathonian bull in the story of Theseus.—The eighth labour was to obtain the mares of Diomedes, king of the Bistones in Thrace, which fed upon human flesh.—The ninth was to bring the girdle of Hippolyta, queen of the Amazons.—The tenth labour was to kill the monster Geryon, and bring his herds to Argos. These were all the labours which were originally imposed on H., but as Eurystheus declared the second and fifth unlawfully performed, H. was ordered to perform two more.—The eleventh was to obtain the golden apples from the garden of the Hesperides. Atlas, who knew where to find the apples, brought them to H., who meanwhile supported the vault of heaven; but according to others, H. went himself and stole the

apples, after slaying the dragon who guarded them.—The last and most dangerous labour was to bring from the infernal regions the three-headed dog Cerberus. Pluto promised him Cerberus on condition that he should not employ arms, but only force. When H. had brought the monster to Eurystheus, the latter, pale with fright, commanded him to be removed. H. set him at liberty, whereupon Cerberus immediately sank into the earth. H. was now free from his state of servitude.

To these well-known 'twelve labours,' must be added many other achievements, such as his battles with the centaurs and with the giants; his participation in the expedition of the Argonauts; the liberation of Prometheus and Theseus, &c. After accomplishing all these exploits, H., while in a state of mental aberration, murdered his faithful friend, Iphitus; he was afterwards purified from the murder; but was compelled to sell himself for three years into slavery. When his period of slavery had expired, he returned to Peloponnesus, and some time afterwards became a suitor for the hand of Dejanira, the daughter of Ceneus, king of Calydon, whom he married, after having overcome his rival Achelous. With her he now repaired to Trachinia. Having arrived at the river Evenus, he encountered the centaur Nessus. H. passed through on foot; but Nessus, under pretence of carrying Dejanira over, attempted to offer her violence; whereupon H. slew him with an arrow dipped in the poison of the Lernaean hydra. Nessus, before expiring, instructed Dejanira how to prepare a love-potion for Hercules. The hero now made war against Eurtyos (king of Oechalia, who had defrauded him), slew him and his sons, and carried off his daughter Iole. Thence he went to Kenæon in Eubœa, and erected an altar to Zeus Kenæos. In order to celebrate the rite with due solemnity, he sent Lichas to Trachis for a white garment. Dejanira, being jealous of Iole, anointed the robe with the philtre she had received from Nessus. H. put it on, and immediately the poison penetrated his bones. Maddened by the terrible pain, he seized Lichas by the feet, and flung him into the sea. He tore off the dress, but it stuck to his flesh, which was thus torn from his bones. In this condition, H. was conveyed by sea to Trachinia; and Dejanira being informed of what had occurred, destroyed herself. H. himself repaired to Mount Ceta, where he erected a funeral-pile, and ascending it, commanded that it should be set on fire. The burning pile was suddenly surrounded by a dark cloud, in which, amid thunder and lightning, H. was carried up to heaven. There he became reconciled to Hera, and married Hebe.

According to most mythologists, there were several heroes of the name of Hercules. Among these are an Indian, an Egyptian, a Tyrian or Phœnician, and a Theban Hercules. The last is the most celebrated, and to him the actions of the others have possibly been attributed. Others, who would explain the story of H. symbolically, pretend that it conceals an astronomical idea; while others discover in this myth the history of the early development of Greece. On the astronomical hypothesis, the twelve labours of H. are simply the course of the sun through the twelve signs of the zodiac, which the plastic poetry of the Greeks has converted into a legend. According to Max Müller, H. was the Sun-god, and the legend of his death symbolises the sunset: 'In his last journey, H. proceeds from east to west. He proceeds from the Kenæon promontory to Trachis, and then to Mount Ceta, where his pile is raised. The coat which Dejanira sends to the solar hero is an expression frequently used in other mythologies, it is . . . the clouds which rise from

the waters, and surround the sun like a dark raiment. H. tries to tear it off, i. e., his fierce splendour breaks through the thickening gloom, but fiery mists embrace him, and are mingled with the parting rays of the sun, and the dying hero is seen through the scattered clouds of the sky tearing his own body to pieces, till at last it is consumed in a general conflagration.' Comparative Mythology, in the *Oxford Essays*, 1856.

Festivals were celebrated in honour of H., at which his exploits were sung. In this manner arose the *Heracleia*, long poems celebrating the life and actions of Hercules. H. is represented in plastic art as the ideal of a hero. Strength is the characteristic idea, which has been developed by the sculptors Myron and Lysippus in a form not to be surpassed. A complete series of representations of the twelve labours may be seen in the vases of Volce. The conflict with the giants very frequently occurs on vases of the oldest style; the one on the casket of Cypselos is particularly worthy of notice. H.'s figure is generally youthful.

Head of Hercules.

oldest style; the one on the casket of Cypselos is particularly worthy of notice. H.'s figure is generally youthful.

HERCULES, PILLARS OF, the name given by the ancients to the two rocks forming the entrance to the Mediterranean at the Strait of Gibraltar. Their erection was ascribed by the Greeks to Hercules, on the occasion of his journey to the kingdom of Geryon. According to one version of the story, they had once been united, but Hercules tore them asunder, to admit the flow of the ocean into the Mediterranean; another version represents him as causing them to unite temporarily, in order to form a bridge. The pillars are not mentioned in Homer, though he speaks of Ulysses' passage out of the Mediterranean into the ocean and back, shewing an apparent knowledge of the existence of the strait. The first author who mentions them is Pindar, who places them at Gades (Cadiz), and his opinion had many followers in later times. The most general opinion, however, identified them with Calpe (now Gibraltar) and Abyla (now Ceuta).

HERCULES BEETLE (*Scarabæus Hercules*, or *Dynastes Hercules*), a coleopterous insect of the family *Lamellicornes* and tribe *Scarabæides*, remarkable not only for its great size—it being five inches

Hercules Beetle (*Dynastes Hercules*).

long—but for the singular appearance of the male; an enormous horn projecting from the head, and being opposed by a similar but smaller projection of the thorax, the whole resembling a pair of great but somewhat unequal pincers, of which the body of the insect is the handle. It is a native of Brazil.

HERCYNIAN FOREST (Lat. *Hercynia silva*; Gr. *Hercynia hylē*, or *Herkynion oros*), the general designation of the entire wooded mountain-range of Middle Germany, from the Rhine to the Carpathian Mountains. Different ancient writers, however, apply the name sometimes to one part, sometimes to another of the range. Aristotle makes the Ister (or Danube) take its rise in it. Cæsar, who estimates it at nine days' journey in breadth, and sixty in length, comprehends under this name the whole of the mountain-ranges in Germany north of the Danube; while some identify it with the Bohemian Forest, and others with the Thuringian Forest. Modern geographers apply the term, for the most part, in a very arbitrary manner.

HERD GRASS. See BENT GRASS.

HERDER, JOHANN GOTTFRIED VON, an illustrious German thinker, was born at Morungen, in East Prussia, in 1744, and studied philosophy at Königsberg under Kant, for whom he conceived an enthusiastic admiration, although subsequently he became one of his most resolute opponents. Here, also, he made the acquaintance of Hamann (q. v.), who first introduced him to the Oriental languages and literatures, and made him appreciate the poetic beauty of the primitive civilisations. In 1764, he was appointed assistant professor and preacher at the Cathedral School of Riga, where his sermons were greatly admired. Here he published his first works, *Fragmente über die neuere Deutsche Literatur* (Fragments on the Recent German Literature, 1767), in which, with bold and fiery vehemence, he attacked the wretched puerilities and errors of the national literature of the day, and the *Kritische Wälder* (lit., Critical Forests, 1769), once, but no longer, of great theological importance. These two works contain the germs of all that is essentially peculiar and characteristic in H.'s thinking. It was during a temporary residence at Strasburg that Goethe made his acquaintance. The latter was five years younger than H., and, as yet, nameless in literature; while H., by his *Fragmente*, was kindling with new fire the soul of Germany. Goethe almost worshipped him; he tells us (in his Autobiography) that the very handwriting of H. exercised 'a magical influence' (*eine magische Gewalt*) over him. In 1775, on the recommendation of Goethe, he was invited to Weimar by the Grand Duke, and appointed court-preacher and consistorial councillor. Here he resided until his death, which took place 18th December 1803. H.'s writings are very numerous, amounting in all to 60 vols. (Stuttg. 1827—1830). They may be divided into three classes: 1. Those relating to religion and theology; 2. Those relating to literature and art; 3. Those relating to philosophy and history. As a theologian, his most important work is his *Geist der Hebr. Poesie* (Spirit of Hebrew Poetry, Dess. 1782; later edition, Leip. 1825; translated into English by Dr James Marsh, 2 vols. Burlington, 1833). As a philosopher, he has left behind him a fund of valuable observations on nature and mankind. His philosophical master-piece is his unfinished *Ideen zur Philosophie der Geschichte der Menschheit* (Ideas towards a Philosophy of the History of Mankind, 4 vols. Riga, 1784—1791; 4th edition, with Luden's Introduction, 2 vols. Leip. 1841; translated into English by T. Churchill under the title, *Outlines of a Philosophy of the History of Man*). In this work, all the rays of his genius converge. His aim is to represent the entire history of the race as a series of events pointing to a higher destiny than has yet been revealed. His love and reverence for humanity are intense, pure, passionate. An

ideal humanity, it might almost be said, is his divinity, in whose service he labours with restless zeal. That enthusiasm, however, which made H. so effective as a mover of men's minds, had its fatal compensation in a deficiency of artistic excellence. His writings have not that fine perfection of style and method which will enable them to float down the stream of time unmolested. Among his other works may be mentioned his *Gedichte Volkslieder*, and the *Cid*, the last of which is considered by the Spaniards themselves to be truly Spanish in its spirit. See H.'s *Lebenbild*, executed by his son (Erlang. 6 parts, 1846—1847).

HEREDITAMENT, in English Law, a comprehensive word, including everything that goes to the heir-at-law. It is often divided into corporeal and incorporeal. Thus, a house or land held in freehold is a corporeal hereditament; while tithes, advowsons, &c., are incorporeal, being merely rights in connection with corporeal things. The word includes some things personal as well as real, as when a chattel right is carved out of an estate of inheritance.

HEREDITARINESS. The influence exerted by parents on the qualities of their offspring is universally admitted, but the relative amount of influence which each parent exerts is still to some extent an open question.

The general structure of the body, the height, the degree of development of the bones and muscles, the tendency to obesity or leanness, &c., seem to depend as frequently on one parent as on the other, in the case of man; but in many animals, as the dog, horse, &c., the father most frequently determines the general form and the size of the body.

The colour and complexion of the offspring follow no definite rule. Sometimes the colours of the two parents appear undiluted in the offspring, as in the case of a piebald colt, resulting from the union of a bay stallion and a white mare, while in other cases an intermediate tint appears in the young. In the offspring resulting from the union of individuals of the dark and white human races, we have this intermediate tint developed; but it is believed that the colour of the father usually predominates over that of the mother.

A very curious department of this subject is the transmission to the offspring of special marks or deformities exhibited by one of the parents or more remote ancestors, and not common to the species. *Nævus* (or mother's marks), moles, harelip, growths of hair in unusual places, an unusual number of fingers or toes, and special malformations of the heart and of other organs, have been frequently traced to hereditary influence. It is deserving of remark, that these peculiarities have a tendency to shew themselves in alternate generations, or even at greater intervals. Burdach, Blumenbach, and other eminent physiologists, have held the doctrine, that parents (whether dogs or men) who have suffered accidental or intentional mutilation of certain parts (as, for example, the tail, fingers, &c.), often produce offspring which inherit these injuries; for instance, the dogs with cropped tails often produce pups with cropped tails. If the facts are true (which possibly may be doubtful), the results are probably due to an impression on the mother's mind rather than to an hereditary tendency. The immemorial practice of the Chinese in stunting the feet of their women, has not produced a natural variety with that peculiarity.

Morell, in his *Introduction to Mental Philosophy*, observes that there are latent powers or tendencies which have been inherited, and which often remain unknown until brought out by peculiar circum-

stances. He gives the familiar example of the pointer. The habit of pointing at game is originally an acquired one; but so strongly does this habit become seated in the race, that the very first time the young pointer is taken into the field, he will stand and mark it, thus developing a purely hereditary instinct. 'Exactly in the same way,' he adds, 'we find in man peculiarities of mind, temper, thought, habit, volition, &c., appearing and reappearing in families and races. Lord Brougham found some of his grandfather's writing exactly resembling his own [which is very peculiar], though the grandfather had died before he was born, and his father's was quite different.' It is alleged that the children of skilled artisans are, as a rule, more apt at petty manipulations than the children of ordinary labourers, and that hence the population of certain towns—Birmingham, for example—has a great advantage over that of other towns in point of manufacturing industry.

It is well known that longevity or the reverse, a tendency to great fruitfulness or to sterility, peculiarities in the degree of delicacy in the external senses, and a special tendency to certain diseases—as gout, pulmonary consumption, cancer, &c.—are frequently transmitted in hereditary descent from one or other parent to the offspring. The predisposition to any special disease may be transmitted by either parent; but where both parents have been affected, the offspring are especially liable to suffer from it. Deformities and diseases, also, engendered by circumstances to which the exposure is lifelong, or affecting successive generations, are more certainly and conspicuously hereditary.

Hereditary Tendency to Mental Disease.—As the mental constitution in general is eminently propagable, the hereditary tendency in mental disease is more familiar and better demonstrated than in other forms of morbid action. One observer attributes six-sevenths of the cases of insanity to this cause. In France, and among the affluent classes, one case in every three; among the peasants, one in every ten, is found to occur in families predisposed to alienation. In Italy, the proportion is nearly the same. When stating that derangement is traced to transmitted taint, expression is given to the complex proposition, that individuals who have inherited an unhealthy cerebral organisation, or bodily qualities, such as anæmia, incompatible with sound mental action, fall victims more frequently and inevitably to insanity than those physically and mentally robust would do. Experience shews that as particular forms of physical degeneration, such as rickets, consumption, in like manner particular species of alienation, are propagated in families; that the suicidal impulse appears in one, while the uncontrollable and insatiable desire for stimulants, is the heritage of a third. There are certain laws by which this proclivity seems to operate. Not merely are there more females than males actually insane, but there are more hereditarily disposed to be insane. In connection with this it must be observed that women are more exposed by constitution to the exciting causes of insanity than males, and that as infants they more readily acquire the mental tone of the mother. But, moreover, the madness of the mother is more frequently transmitted than that of the father. French authorities record that of 467 cases of mental affections, 279 were traceable to the mother: an English physician similarly records 76 out of 133. Where the taint exists on the side of the mother, a greater number of children, and a greater number of daughters, are born of unsound mind. But this disposition to disease of the nervous matter is manifested in the same family

in various forms—in one member suffering under epilepsy, another under mania, another under eccentricity or delusions. Even the last are exhibited in successive generations. Oxford, who fired at the Queen, his father, and grandfather, all believed themselves to be St Paul.—Holland, *Medical Notes*, &c.; Lucas, *L'Hérédité Naturelle*.

HEREDITARY PRIVILEGES AND POSSESSIONS. The question of the admissibility of hereditary rights and privileges has been much agitated with regard to three points, especially in more recent times. The first is hereditary monarchy. The 'divine' right of kings is now little urged, being felt to be incompatible with modern notions of the political relations of society; and the defence of the hereditary transmission of the supreme power of the state is rather rested on the ground of political expediency and necessity. The animosities and disturbances of public affairs that attend the ever-recurring election of a head of the state are avoided, it is argued, by making power hereditary in a particular family, and by a determinate law of succession; while the dangers and disadvantages which might arise from an authority depending upon the chance of birth, are capable of being neutralised by institutions which prevent the monarch from doing harm, even if there were not every reason to hope that self-interest will lead him to use the power which is the birth-right of his family, for the permanent honour and advantage of that family, and, therefore, of the community with which it is indissolubly bound up.

Another and perhaps more difficult aspect of the question is with regard to hereditary classes, dignities, and offices in the state over and above the hereditary monarch. One thing is now universally agreed upon, that the transmission in individual families of dignities, rights, and offices, involving essential parts of government, such as the supreme dispensation of justice, and other attributes of sovereignty, is inconsistent with the very idea of a state. The splitting up of Germany into a maze of petty sovereignties arising out of fiefs of the empire become hereditary, is a signal instance of the dangers of this principle. A hereditary nobility with such rights is no longer considered defensible. It is another question whether, as a political institution, a class with certain hereditary privileges may not be advantageous or even necessary as an element of stability, and as affording a source of trained statesmanship. Society has a longer life than the individuals that compose it, and should have further-stretching views—'looking before and after;' and it is chiefly in the great historical families of a nation, that such extended views grow up and are cherished—families whose traditions form part of the national history, and which naturally identify their future with the national prosperity and dignity. Besides their traditions and well-developed national instincts, the individual members of such families enjoy other advantages as political and social leaders. Their usually good education, and their well-secured possessions which, in addition to a high sense of honour, raise them above having recourse to petty shifts and jobs, make them valuable as examples and as administrators in a commonwealth which aims at dignity and stability. Carried to an extreme length, as was the case in France prior to the great revolution, the hereditary privileges of the nobility became a source of social discontent and disorder; but limited as in the United Kingdom, hereditary privileges and dignities are found to be no way incompatible with the utmost social expansion, and are in reality so popular as to be admittedly a happy feature in the structure of society. It is further to be observed,

that as great families with privileges and titles are from time to time dying out, while others, through distinguished public services, are raised to the rank of nobility, that degree of infusion of new blood is kept up which gives vigour to the system, and at least prevents the British aristocracy from degenerating into an effete or antiquated caste.—As regards the economic view of hereditary right to private property, see J. S. Mill's *Political Economy*.

HEREDITARY RIGHT, strictly speaking, means the right of succession as an heir-at-law. The foundation of this right is nothing but convenience, the principle being, that if a man does not by will appoint his own heir, the law will do it for him; and the law, in doing this, proceeds according to certain degrees of relationship. It is therefore a mistake to suppose that there is anything in mere hereditary right which is divine, or superior to that which results from the radical right of ownership. It is a secondary and substitutional right, the principal and primary right being that by which the owner of land is entitled to say who shall at his death enjoy that land.

HEREFORD, a city, parliamentary and municipal borough, and capital of the county of the same name, is situated in the fertile and highly cultivated valley of the Wye, 134 miles west-north-west of London. The principal building is the cathedral, a noble edifice, 350 feet long, and 174 feet broad, commenced in 1079. A very interesting old map of the world, said to date from the 13th c., and other geographical works, are deposited in the chapter-house and library. Besides many other public buildings, H. contains numerous benevolent and educational institutions, among the latter of which are several important free schools. Among its manufactures, which, however, are inconsiderable, gloves, hats, and flannel are the chief. Of its five annual fairs, that held in October is perhaps the largest in the county for cattle and cheese. H. returns two members to the House of Commons. Pop. in 1851, 12,108; in 1861, 15,625; in 1871, 18,355.

HEREFORDSHIRE, an inland county in the west of England, is bounded on the W. by South Wales, and on the E. by the counties of Worcester and Gloucester. Area, 534,823 acres. Pop. (1871) 125,364. The surface of the county is hilly, with occasional valleys opening into wide-spread plains. Among the chief hill-ranges, are the Black Mountains on the western, and the Malvern Hills on the eastern border of the county. The whole of H. is in the basin of the Severn, and the general direction of the streams is south-east toward that river. The Wye, with its affluents the Lugg, the Arrow, and the Teme, are the principal rivers. The climate of H. varies with the elevation and the exposure, but, as attested by the general longevity of the inhabitants, is on the whole exceedingly healthy. The soil is for the most part a deep, heavy, red loam, which produces good crops of grain, chiefly wheat, and is highly favourable to the growth of trees. Oaks and apple-trees abound, orchards are numerous, and cider is made in great quantity. Sheep and cattle of excellent breeds are extensively reared, and in the north-west of the county a useful breed of horses is produced. Agriculture is the chief employment of the inhabitants.

H., or at least the greater part of it, formed a portion of the territory of the ancient Silures, and was conquered by the Romans in about 73 A.D. During the so-called Heptarchy, it was included in Mercia. From its position on the Welsh border—a portion of the county being included in the debatable land called the 'Marches'—H. was long the scene of frequent contests.

HERENCIA, a town of Spain, in the province of Ciudad Real, and about 40 miles north-east of the city of that name. It carries on manufactures of soap, has a large weekly market and a population of 6400.

HERESY (Gr. *Hairesis*) primitively means a choice or election, and in its application to religious belief is used to designate as well the act of choosing for one's self, and maintaining opinions contrary to the authorised teaching of the religious community to which one's obedience is due, as the heterodox opinions thus adopted and the party which may have adopted them. In the Acts of the Apostles (see Acts v. 17; xv. 5; xxiv. 5; xxviii. 22), the word seems to be used of a sect or party, abstracting from the consideration of its character whether good or bad; but in the Epistles and in the early Christian writers it is almost invariably used in a bad sense, which is the sense uniformly accepted in all subsequent theological literature. The notion of heresy, as understood by theological writers, involves two ideas: first, the deliberate and voluntary rejection of some doctrine proposed by the supreme authority established in any church as necessary to be believed; and secondly, a contumacious persistence in such rejection, with the knowledge that the belief of the doctrine is required of all the members of that particular religious community. Roman Catholic writers, regarding the authority of their own church as supreme and final, apply the name of heresy to any formal denial of a doctrine proposed by the Roman Catholic Church as necessary to be believed. Protestant writers seldom use the word, except in relation to what each sect regards as the essentials of Christian faith. Beyond this point, indeed, the idea of heresy has no proper place in the dogmatical system of the Protestant sects, especially in reference to other communions than their own. In the Roman Catholic Church, the supreme authority may be either the decree of a general council approved by the pope, or a dogmatical decree of the pope himself, expressly or tacitly received by the bishops of the various churches; and in general the crime of heresy is incurred in any church by the rejection of a doctrine which in that church is held to constitute an essential and integral portion of the Christian faith. Apostasy is the complete abandonment of the whole Christian doctrine, and the renunciation of the Christian profession. If the intellectual error be accompanied by full deliberation, and by full knowledge of the motives of belief, the heresy is called *formal*; should it arise from ignorance or imperfect knowledge, it is styled *material*; and the heresy is held to be imputable, or the contrary, according as this ignorance is vincible or invincible.

Even in the apostolic times, heresies had arisen in the church, and before the council of Nice, the catalogue of sects had already swelled to considerable dimensions. Without attempting any enumeration of these heresies, it may be said in general that the sects of the early centuries are all reducible to two classes: (1) Those which attempted to associate the Christian doctrines with Judaism; (2) Those which ingrafted Christianity upon the Gentile religions or the Gentile philosophies. And this latter class naturally subdivides itself into (1) The sects which were tinged with the errors of the oriental philosophy; and (2) Those which drew their errors from the Grecian schools. Of all these we find traces, more or less distinctly marked, in the sects of the later ages.

From the very date of the establishment of Christianity in the Roman empire, heresy appears to have been regarded as a crime cognizable by the

civil law; and Constantine enacted several severe laws for its repression, which were continued and extended by his successors, and were collected into a single title, *De Hæreticis*, in the Justinian code. The penalties of heresy ordained by these enactments are very severe, extending to corporal punishment, and even to death; and they all proceed on the distinct assumption that a crime against religion is a crime against the state. These enactments of the Roman law were embodied in the various codes of the European kingdoms; and in considering the history of the middle ages, it is necessary to recollect that the principle above referred to, as to the social bearing of the crime of heresy and of other crimes against religion, pervades the whole system of medieval jurisprudence. It is further to be remembered, that the principles of many of the medieval sects were anti-social and communistic, as well as opposed to the doctrines of the church; and that their leaders, in many instances, by adopting violent and revolutionary means for the propagation of their doctrines, drew upon themselves the punishment of anarchy and rebellion, as well as of heterodoxy in religion. Still, with even these allowances, Catholic historians themselves admit that the medieval procedures against heresy were in many instances excessive, as were, indeed, also the processes and penalties of the criminal code.

In English Law (2 Hen. IV. c. 15), heresy consisted in holding opinions contrary to Catholic faith and the determination of Holy Church; and by common law the offender was to be tried in the provincial synod by the archbishop and his council; and, after conviction, was to be given up to the king to be dealt with at his pleasure, the king being competent to issue a writ *de hæretico comburendo*; but the statute above referred to empowered the diocesan to take cognizance of heresy, and on conviction, to hand over the criminal directly, and without waiting for the king's writ, to the sheriff-major or other competent officer. This statute continued practically in force, with certain modifications, till the 29 Charles II. c. 9, since which time heresy is left entirely to the cognizance of the ecclesiastical courts; but, as there is no statute defining in what heresy consists, and as, moreover, much of the jurisdiction of the ecclesiastical courts has been withdrawn by the various toleration acts; and, above all, as the effect of various recent decisions has been to widen almost indefinitely the construction of the doctrinal formularies of the English Church, it may now be said that the jurisdiction of these courts in matters of heresy is practically limited to preventing ministers of the Established Church from preaching in opposition to the doctrine and the articles of the establishment from which they derive their emoluments, and that, even in determining what is to be considered contrary to the articles, a large toleration has been juridically established. See the recent trial of Dr Rowland Williams, and the judgment given by Dr Lushington in the Court of Arches. For the history and literature of heretical sects, see the various ecclesiastical historians, as also Stockmann's *Lexicon Hæresium* (Leip. 1719); De Cæsari's *Heresiologia* (Rome, 1736); Fritz's *Ketzerlexicon* (Würzburg, 1834); Arnold's *Ketzerhistorie* (Frankfurt, 1699); Walch's *Geschichte der Ketzer* (Leip. 1762); and Hilger's *Darstellung der Hæresien* (Bonn, 1837).

HERFORD, a town of Prussia, in the province of Westphalia, is situated close to the frontier of Lippe-Detmold, on the Werre, 17 miles south-west of Minden. Yarn-spinning, linen-weaving, and carpet manufactures are carried on. Pop. (1871) 10,968.

HERIOT, GEORGE, founder of a magnificent hospital at Edinburgh, the son of a goldsmith in that city, a descendant of the Heriots of Trabroun, East Lothian, was born in June 1563. Admitted, in May 1588, a member of the Edinburgh Incorporation of Goldsmiths, he was, in 1597, appointed goldsmith to Anne of Denmark, consort of James VI. of Scotland, and soon after to the king. On the accession of the latter, in 1603, to the English throne, he went to London, where, as court-jeweller and banker, he amassed considerable riches. He died February 12, 1624, without issue, and bequeathed the greater part of his wealth to the town-council and ministers of Edinburgh, to found and endow an hospital in that city for the maintenance and education of the sons of poor deceased or decayed burgesses. The noble structure of Heriot's Hospital, from a design, it is believed, by Inigo Jones, was completed, in 1649, at a cost of £30,000 sterling. After the battle of Dunbar, in 1650, Cromwell made it a military hospital; but in 1658 it was restored to the governors by General Monk; and in 1659, 30 boys were admitted. 120 boys are now maintained and educated in it, 60 of whom are non-resident. In 1766 the annual revenue was £1966. In 1837 it amounted to £11,235, leaving, in that year, a surplus of £3099. The yearly revenue is now about £18,000. Most of the ground on which the New Town of Edinburgh is built belongs to the hospital. The revenues greatly exceeding the expenditure, in 1837 an act of parliament was procured for the erection of schools in Edinburgh for the education of poor children, free of all expense. Of these 'Heriot Schools,' there are sixteen—viz., eleven juvenile and five infant schools—attended by upwards of 4000 boys and girls; other three infant schools are to be added. The children who are eligible to these schools are, first, children of decayed burgesses and freemen; and, second, children whose parents are in poor circumstances, and who reside within the royalty of Edinburgh; but of late, admission has also been given to the children of parents residing beyond that limit. There is a system of bursaries connected with the Hospital, both for the boys who are educated in it, and for others who are elected according to the discretion of the governors—'house bursars,' £30 a year; and 'out bursars,' about £20; the former established in 1810, the latter in 1825.

HERIOT, in English Law, is a kind of fine due in copyhold estates to the lord of the manor on the death of the copyholder, and consists of the best beast, jewel, or chattel that belonged to the deceased. The lord can enforce this right by action, or seize it *brevi manu*. Such a right is practically unknown in freehold estates in England. In Scotland, all land is held on much the same forms as copyholds; and much more vexatious things of a similar kind to heriots, under the name of reliefs, become due from a vassal's heir to the superior on the vassal's death. In both countries, the practice is equally barbarous.

HERISTAL, or **HERSTAL**, a considerable village of Belgium, in the province of Liege, extends along the left bank of the Maas for about three miles, immediately below the city of Liege, of which it may almost be considered a suburb. Population about 7000, principally workmen, who find employment in the coal-mines, the iron and steel works, which are here carried on. Some ruins still exist of the castle of Heristal, the birthplace of Pepin le Gros (father of Charles Martel, and great-grandfather of Charlemagne), and from which he had his title of Pepin d'Heristal.

HERITABLE AND MOVABLE, a Scotch law-

phrase denoting the distinctions of things which go to the heir and to the executors respectively. The distinction corresponds to a certain extent to the phrase 'Heir and Executor' (q. v.) in England.

HERITABLE BOND, in Scotch Law, is a bond for a sum of money, and joined with it a conveyance of land in security thereof. The usual deed is now a bond and disposition in security, corresponding to the English mortgage (q. v.).

HERITABLE JURISDICTIONS, a remarkable class of jurisdictions held hereditarily from the crown in Scotland, abolished (1748) by 20 Geo. II. c. 43. These jurisdictions amounted to upwards of a hundred in number, and consisted of sheriffships, stewardries, constabularies, but principally of regalities and bailieries, with some offices of distinction. One of the more important was the office of Lord Justice-general, and the lordship of Argyle and the Isles, both belonging to the family of Argyle. In virtue of their hereditary rights, the possessors of these jurisdictions exercised an arbitrary power over vassals and others within the limits of their domain, and could punish them by fines, scourging, imprisonment, and even in some cases put them to death, without interference of the common law. As repugnant to social policy, and more particularly with the view of extinguishing the authority of Highland chiefs over their clans, these heritable jurisdictions were abolished; the possessors receiving payment for the assumed value of their rights. Argyle, alone, received £21,000 as an indemnity, and altogether there was paid by government £152,037, 12s. 2d. The abolition of these odious jurisdictions being followed by the appointment of sheriffs on a proper footing, this great legislative act marks an important era in the history of Scotland.

HERITABLE SECURITIES, the name given in the law of Scotland to what are called mortgages and charges on land in England. These were formerly distinguished into wadset, infetment of annual rent, heritable bond, bond and disposition in security, and absolute disposition with back-bond, and also reserved burdens on land. All heritable securities are founded on the theory, that they constitute a pledge of the land to the creditor until the debt is paid, or rather the debt is a burden on the land, so that whatever becomes of the land, into whatever number of hands it is conveyed and transferred, the debt still inheres in it, and must be first paid out of the proceeds, unless it is redeemed. In Scotland, the principal heritable security is now called the bond and disposition in security, which consists of an obligation to pay the debt, and a disposition *pro tempore* to the creditor, by way of security till the debt is paid. The bond must be registered in the Register of Sasines, to complete the title, and it is assignable to a third party. A power is always given to the creditor to sell the estate, if the principal or interest is not paid, in which case, the creditor must account for the surplus after paying himself his debt.

HERITOR, in the Law of Scotland, is the owner of land in a parish liable to public burdens. The heritors, collectively, have vested in them the fee of the church and churchyard; they elect the parish schoolmaster, repair the parish church, &c.

HERMÆ. See **HERMES**.

HERMANDAD, **THE** (Sp. 'Brotherhood'), an association of the principal cities of Castile and Aragon, bound together by a solemn league and covenant for the defence of their liberties in seasons of trouble. These confederacies were sanctioned by the sovereigns, as agents for suppressing the increasing power of the nobles, and for maintaining

public security through the land with no cost to the government. In Aragon, the first *Hermidad* was established in the middle of the 13th c., and in Castile about 30 years later; while in 1295, 35 cities of Castile and Leon formed a joint confederacy, and entered into a compact, by which they pledged themselves to take summary vengeance on every noble who had either robbed or injured a member of their association, and refused to make just atonement for the wrong; or upon any one who should attempt, even by the order of the king, to levy an unjust tax. During the long period of anarchy in which the Christian rulers of Spain were impotent to maintain order in their own dominions, the *Santa Hermidad*, or Holy Brotherhood, had presented the only check against the unbounded licence of the nobles; and Isabella of Castile, seeing the beneficial effects which an extension of the institution was capable of producing, obtained the sanction of the Cortes for its thorough re-organisation and extension over the whole kingdom in 1496. The crimes reserved for its jurisdiction were all acts of violence and theft committed on the high-roads or in the open country, and the penalties attached to each misdemeanour were specified with the greatest precision in the codes of laws, which were enacted at different times in the yearly assemblies of the deputies of the confederate cities. An annual contribution was, moreover, assessed on every hundred householders or *vecinos*, for the equipment and maintenance of the horsemen and *quadrilleros* or officials of the brotherhood, whose duty it was to arrest offenders, and enforce the sentence of the law. Although the *Hermidad* was regarded with much disfavour by the aristocracy, it continued for many years to exercise its functions, until the country was cleared of banditti, and the ministers of justice enabled to discharge their duties without hindrance from lawless disturbers of the peace. In 1498, the objects of the *Hermidad* having been obtained, and public order established on a firm basis, the brotherhood was disorganised, and reduced to an ordinary police, such as it has existed, with various modifications of form, to the present century. The laws enacted at different times in the *juntas* or assemblies of the *Hermidad* were compiled, in 1485, into a code, known as the *Quaderno de las Leyes nuevas de la Hermidad*, which was first printed at Burgos in 1527.—See Mariana, *History of Spain*; Pulgar, *Reyes Catolicos*; Prescott, *History of Ferdinand and Isabella*.

HERMANN, JOHANN GOTTFRIED JAKOB, a German philologist of great genius and learning, was born at Leipsic, 28th November 1772; studied there and at Jena, and was made, in 1798, extraordinary professor of philosophy. In 1803, he was called to Kiel as ordinary professor of eloquence, becoming in addition professor of poetry in 1809, and in this position he remained till his death, 31st December 1848. Distinguished by liberal-mindedness and love of truth, by eloquence and extensive culture, H. continued till his latest days to attract a large circle of students to his class-room, which sent forth some of the most celebrated teachers in the schools and universities of Germany. The first department which he began to cultivate on original principles was the science of metre, of which he attempted to develop a philosophical theory from the categories of Kant; and on this subject he wrote, besides his *Handbuch d. Metrik* (1798), several Latin treatises, among which his *Epitome Doctrinæ Metricæ* (1818) reached a third edition in 1852. Of wider importance, however, was the new method which he introduced into the treatment of Greek grammar, which has had its

influence on the grammar of Latin, and even of modern languages, especially of the German. The principles of this method are not only explicitly developed in his *De Emendendâ Ratione Græcæ Grammaticæ* (1801), but are practically illustrated in his numerous editions of the ancient classics. H.'s power of dealing with chronological, topographical, and personal questions, is shewn in his *Opuscula* (7 vols., Leip. 1827—1830), which also contain some poems breathing the spirit of Roman poetry. Consult Jahn's *Gottfried H. eine Gedächtnissrede* (Leip. 1849).

HERMANN, or HERMAN, a name that first appears in Germany in the 6th c. after Christ, but is now become common. It has been erroneously transferred to that prince or chief of the Cherusci, called by Roman writers Arminius, and by the Greeks Armenios. This personage was the son of Sigimer, and was born 16 B.C. The period in which the youth of H. was cast was fraught with the greatest peril to Germany. To secure the frontiers of the empire against the attacks of the Germanic tribes, the Romans had been forced to advance into the more turbulent districts, and to build a series of forts to overawe the inhabitants. In this manner, not only had most of the Celtic tribes from the Alps to the Danube been subdued, but in the years from 9 B.C. to 4 A.D., Drusus and Tiberius had penetrated into the north-west of Germany as far as the Elbe, laid out a number of military roads, erected fortresses in the country, and reduced the different tribes to such dependence upon Rome, as virtually amounted to complete subjugation. With so much prudence and caution had Tiberius proceeded, that the Germans continued to all appearance on the best terms with the Romans, gradually adopted Roman habits, and frequently and readily took service in the Roman armies. Thus H. and his brother Flavius had enrolled themselves under the Roman standards, and as leaders of Cheruscan auxiliaries, had not only obtained Roman citizenship and the rank of knight-hood in the country of the Danube, but had likewise acquired a knowledge of the Latin language, and a deep insight into the arts of war and policy as practised by the Romans. Enriched with these experiences, when H. after the expiration of some years, returned home, he found the state of affairs considerably changed for the worse, through the unskilful despotism of the Roman viceroy, Quintilius Varus. H. now conceived the plan of delivering his country from its oppressors. All the tribes and leaders as far as the Elbe were secretly summoned; Varus was lulled into security, and induced to despatch portions of his army to different points, and with the remaining portion, which was just on the point of leaving the country of the Cherusci for the Rhine, to quit the highway. He was thus lured into the impassable districts of the *Teutoburg Forest* (either in the upper valley of the Lippe, or the adjoining Prussian territory); an engagement took place, which lasted for three days. The result was the annihilation of the whole Roman army (9 A.D.). When intelligence of this defeat reached Rome, it excited the greatest consternation and anxiety. The Germans, however, who had only their own liberation in view, prosecuted their victory no further; and for a few years both parties, so to speak, hung fire. When Germanicus (q.v.), however (14 A.D.), assumed the command on the Lower Rhine, he resolved to crush the barbarians. In two successive campaigns, 14 A.D. and 16 A.D., he reduced H. to great straits; but he being recalled to Rome by the Emperor Tiberius, 17 A.D., the results of his victorious activity were lost. From this time no Roman army ever ventured to penetrate

from the Rhine into the interior of Germany, and this circumstance, which decided the future fate of Germany, must be ascribed chiefly to Hermann. Nevertheless, no sooner was the foreign enemy expelled, than the internal feuds broke out with more violence than ever. In the course of these, H. was slain by his own relatives, in the 37th year of his age and twelfth of his leadership. Tacitus says of him: 'He was, without doubt, the deliverer of Germany; and unlike other kings and generals, he attacked the Roman people, not at the commencement, but in the fulness of their power; in battles, he was not always successful, but he was invincible in war. He still lives in the songs of the barbarians, though unknown to the annals of the Greeks, who admire only what belongs to themselves; by the Romans, he is not estimated according to his merits, because in our admiration for the past, we neglect the present.'—Compare Wietersheim, *Der Feldzug des Germanicus an der Weser* 16 n. Chr. (Leip. 1850); Massmann, *Arminius, Cheruscorum Dux ac Decus, Liberátor Germaniæ* (Lungo, 1839).

HERMANNSTADT (Lat. *Cibinium*, Hung. *Nagy-Szeben*), an important town of Austria, capital of the crown-land of Transylvania, is beautifully situated on the Cibun, or Zibin, an affluent of the Aluta, about 70 miles west-north-west of the town of Cronstadt. H. is the seat of the Austrian governor of Transylvania, and of a Greek non-united bishop, and is the head-quarters of the 12th corps of the imperial army. Pleasing promenades surround the town, and the district in which it is placed is fertile as well as beautiful. Tanning, wax-bleaching, and the manufacture of cloth (linen and woollen), combs, paper, and gunpowder, chiefly employ the inhabitants. The local trade is considerable. Pop. 18,600, one-half of whom are Protestants.

H., originally a village, is called, on the ancient seal of the town, *Villa Hermanni*. The *Hermann* from whom the town has its name was a citizen of Nürnberg, and is said to have led hither a colony in the 12th century.

HERMAPHRODITE, in Botany, the term employed to designate those flowers which contain both the male and female organs of reproduction (stamens and pistils), and are therefore by themselves capable of producing perfect seed. Flowers containing only male or female organs are called *unisexual* or *diclinous* (q. v.), and when produced on the same plant, *Monœcious* (q. v.); when on different plants, *Diœcious* (q. v.). Hermaphrodite flowers are also called *monoclinous* (Gr. *monos*, one, and *klinê*, a couch) and *perfect* flowers.

HERMAPHRODITISM is the term employed by naturalists to designate the state or condition of those organisms, whether animal or vegetable, in which the sexual characteristics of the male and female are united in the same individual. The name is derived from the fable of the union into one of the bodies of Hermaphroditus, son of Hermes and Aphrodite, and the nymph Salmacis. See Ovid's *Metamorphoses*, lib. iv. v. 347.

There are two kinds of hermaphroditism, the true and the spurious; in the former, there is an actual co-existence, in the same individual, of male and female reproductive organs; while in the latter, there is only an appearance, from arrest or excess of development, of a union of the distinctive organs of both sexes. True hermaphroditism is the normal type of sexual structure in most plants. See **HERMAPHRODITE**, in Botany. It likewise occurs normally in many of the lower invertebrata, and as a monstrosity in the higher invertebrata, and even occasionally in certain vertebrata.

The recent investigations of Balbiani shew that certain Infusoria (as, for instance, the common green *Paramecium*), at all events occasionally present the phenomena of hermaphroditism. In some of the polypts (as, for example, the Hydra and some of the Actiniae), the sexes are united in the same individual; the same is the case with some of the *Acalephæ* (namely, the *Ctenophora*), with certain orders of Helminthes or parasitic worms (the Cestodes and Trematodes), with certain Annelides (the Hirudineæ and Lumbricini, of which the leech and the earth-worm are typical examples), with many acephalous molluscs, with the Pteropods and with most of the Gasteropods; while in the highest order of molluscs, the Cephalopods, the sexes are always distinct. Among the crustaceans, the Cirrhipeds are for the most part hermaphrodites; but in the other and higher orders, if hermaphroditism exists, it is only as an abnormal occurrence, and gives rise to a monstrosity. (For example, the common lobster has been observed with male organs on one side of its body, and female organs on the other.) True but not normal hermaphroditism is also occasionally met with in insects. In fourteen cases given by Oehsenheimer, the right side was male, and the left female; and in nine cases it was the reverse. Professor Owen remarks that in insects hermaphrodites are occasionally found, where the characters of one sex, instead of extending over one-half, are limited to particular parts of the body which agree in the main with the other sex. Thus, in an individual of *Gastrophaga quercus*, the body, the antennæ, and the left wings were those of the female, while the right wings were those of the male.

True (but of course abnormal) hermaphroditism is far rarer amongst the vertebrata than in insects or crustaceans. Various instances, however, are on record of fishes presenting a lateral hermaphroditic structure, or a roe on one side and a milt on the other; and references to various cases that have been reported may be found in Professor Simpson's learned and elaborate article, 'Hermaphroditism,' in *The Cyclopædia of Anatomy and Physiology*. The same article may be referred to for cases of similar hermaphroditism in birds and mammals, including the human subject, namely, cases in which there were female structures on one side, and male structures (more or less perfect) on the other.

Returning from these cases of abnormal true hermaphroditism to those of normal true hermaphroditism, the question naturally suggests itself—Can these true animal hermaphrodites, possessing male and female organs, fertilise themselves? As far as is known, none of the terrestrial hermaphrodites, such as land-molluscs (the common snail, for example) and earth-worms, are self-impregnating. They all pair, and in this respect offer a strong contrast with hermaphrodite plants. But of aquatic animals, there are many self-fertilising hermaphrodites. For further details on the subject of hermaphroditism generally, the reader is referred to Steenstrup's *Untersuchungen über das Vorkommen des Hermaphroditismus in der Natur* (1846).

Spurious hermaphroditism is a subject of too purely a professional character to be noticed at all fully in these pages. Those who take an interest in this subject may be referred for further information to Professor Simpson's article, and to a case recorded about two years ago in *The Lancet* by Dr Girdwood.

HERMAS, the name of one of those who were members of the Roman Church at the time at which St Paul wrote his Epistle to the Romans, and, as may be inferred from the apostle's addressing a special greeting to him, a person of some eminence among his fellow-Christians. He was, though

resident at Rome, most probably, judging from his name, of Greek origin. H., however, has obtained even more consideration from the circumstance of his being the reputed author of the well-known early treatise, called *The Shepherd*, which is commonly classed among the writings of the apostolic Fathers. It is ascribed to the H. of St Paul, more or less positively, by Origen, Eusebius, and St Jerome. But there is a second H., who lived about the middle of the 2d c., a brother of Pius I., Bishop of Rome, to whom the work is attributed by other writers, and it would seem with greater intrinsic probability. The work contains many allusions which appear to be directed specially against the Montanistic errors—a fact quite irreconcilable with the supposition of its having been written in the apostolic age. *The Shepherd*, whichever H. may have been its author, seems to have been originally written in Greek. However, until recently, it was known only by a Latin version, with the exception of some Greek fragments collected from the quotations of the work by the Greek Fathers. But in the year 1856, a Greek text, said to have been found at Mount Athos, by the since too notorious M. Simonides, was published at Leipzig, the genuineness of which is more than doubtful; and an Ethiopic version was printed in 1860, by M. Antoine d'Abbadie, the well-known Abyssinian traveller and scholar. *The Shepherd* is a mystical work, divided into three parts—the first containing four 'Visions'; the second, twelve 'Precepts'; and the third, ten 'Similitudes.' It has been described as the *Pilgrim's Progress* of the early church; and although it contains but little of positive dogmatic teaching, is a most interesting monument of the Christian life of that period.

HERMENEUTICS (Gr. *Hermeneutes*, an interpreter), the science of interpretation, especially as applied to the Holy Scriptures. It forms a branch of the same general study with Exegesis (q. v.), and indeed is often confounded with that science; but the distinction between the two branches is very marked, and is perhaps sufficiently indicated by the etymology of the names themselves. To hermeneutics properly belongs the 'interpretation' of the text—that is, the *discovery* of its true meaning; the province of exegesis is the 'exposition' of the meaning so discovered, and the practical office of making it intelligible to others in its various bearings, scientific, literal, doctrinal, and moral. Hence, although, as will be seen by reference to the article EXEGESIS, the laws of interpretation have many things in common with those of exposition, it may be laid down that to the especial province of hermeneutics belongs all that regards the text and interpretation of the Holy Scripture; the signification of words, the force and significance of idioms, the modification of the sense by the context, and the other details of philological and grammatical inquiry; the consideration of the character of the writer or the persons whom he addressed; of the circumstances in which he wrote, and the object to which his work was directed; the comparison of parallel passages; and other similar considerations. All these inquiries, although seemingly purely literary, are modified by the views entertained as to the text of Holy Scripture, and especially on the question of its inspiration, and the nature and degree of such inspiration.

So far, there is but little difference between Roman Catholic hermeneutists and the more strict school of Protestant critics. It is at this point that the fundamental distinction between Catholics on the one side, and Protestants of every shade on the other, may be said to begin. With the latter, the sense of the Scripture once truly ascer-

tained from the Scripture itself interpreted by the rules explained above, is regarded as final, and is accepted by the interpreter as the revelation intended by God. With the former, the individual judgment which is formed upon these rules, and which, as to the actual meaning of the particular passage, may possibly coincide with that of the Protestant, is still controlled, and, it may be, overruled by the authoritative interpretation of the church, as conveyed in the decrees of councils, or the dogmatical definitions of pontiffs accepted by the universal church. From this circumstance, it is often inferred that in the Roman Catholic Church the science of hermeneutics is a nullity, and that no freedom of interpretation is practically permitted. The Roman Catholic critic, however, maintains that he exercises, and is free to exercise, on the text of Scripture the same liberty of interpretation which the Protestant may claim; and that it is quite possible that he may arrive at precisely the same conclusions with the Protestant as to the meaning of the *scriptural text considered in itself alone*. But he differs from the Protestant in believing that the Scripture does not contain the whole of God's revelation, and, therefore, that, as one passage of Scripture is modified by another, so the scriptural revelation itself may be modified by other revelations of God conveyed to us through other mediums; as, for example, that of tradition. See TRADITION. As regards the literature of Hermeneutics, most of the writers named in the article EXEGESIS have dealt with both branches of the science. They are for the most part Protestant. The most remarkable modern Catholic hermeneutical writers are, Hermann Goldhagen (Mainz, 1765); Seemüller's *Hermeneutica Sacra* (1779); Mayr's *Institutio Juavp. Sacri* (1789); Jahn's *Enchiridion Hermen.* (Vienna, 1812); Arigler's *Hermeneutica Generalis* (Vienna, 1813); Unterkircher's *Hermeneutica Biblica* (1831); Ranolder, *Herm. Bibl. Principia Rationalia* (Fünf Kirchen, 1838); Schnittler, *Grundlinien der Hermeneutik* (Ratisbon, 1844); Glaire's *Hermeneutica Sacra* (1840).

HERMES, the name of a divinity more familiarly known as Mercury, the god of speech, eloquence, the sciences, traffic, theft, and herds. Under his name are comprised several mythological personages, who personified the external expression of thought, whether human or divine. The principal of these are Teti, Thoht, Theuth, or Taut, the Egyptian H., the Greek god properly so called, the Phœnician Taaut, the Carthaginian Sumes, the Etruscan Turms, the Chaldean Duvanai, and the Latin Mercurius. The oldest of these was undoubtedly the Egyptian, whose worship appears as early as the 11th dynasty. Thoht was generally represented with the head of an ibis (*heb*), which was his living emblem, and expressed his name in hieroglyphs. These, according to the legends, he had invented and revealed to the monarch Thamus. Many religious books were believed to have been written by him, and all literary compositions were dedicated to him. He was scribe or clerk of the gods, and in the future state justified the good against their accusers, as he formerly had Osiris in the trial of that god and Typhon. In the contest between Osiris and Typhon, when Horus had torn off the diadem of his mother Isis, Thoht is reported to have replaced it with the head of a cow. Locally, he was lord of Sesenu, Hermopolis, the modern Eshmuni, but his worship was universal. He was a self-created, self-existent god, although some legends of later date make him the son of Chnumis, or of the Nile. In his celestial character he was identified with the moon, *Aah*, and was supposed to preside over that luminary,

and the souls which made it their habitation. He inscribed also the names of monarchs on the *asht* or Persea, the tree of life of the Egyptian paradise.

In the Phœnician mythology, Taaut or H. seems derived from the Egyptian, and he was the son of Misor or Egypt, inventor of writing and the sciences; while another form of his name, Sumes, is that of the Punic H. of Carthage. It is, however, clear that the name Taaut is derived from the Egyptian Tet, 'word' or 'speech.' The tradition of H. has passed to the Arabs, who recognise two Hermes, one who lived 1000 years after Adam, called by the Chaldees Ouriai or Duvanai, the great master; another, surnamed Thani, doctor of the world, and liberator of men from error, a prophet and philosopher; and Trismegist, the thrice-great, who lived at Calovaz, in Chaldæa.

But the most important of all was the Greek Hermes. The various traditions which make him the son of the Egyptian Nilus, whose name was never pronounced, or the sacred Thoth, are clearly Egyptian; that which derives his origin from Ouranos, and Hemera, is probably the Phœnician myth. But the principal H. in whom the actions of the others centered, was the son of Zeus and Maia, born on Mount Cyllene, in Arcadia, and originally a Pelasgian divinity who presided over cattle and commerce. His birth is placed subsequent to that of Apollo. Four hours after, according to the hymn, he left his cradle, and having found a tortoise, invented the *chelys*, or lyre, using its shell as a sounding-board, and making the strings out of the entrails of a sheep. At nightfall he stole fifty of the sacred herd of Apollo from Pieria, drove them to the banks of the Alpheus, slaughtered and dressed two of them. To escape detection, he had bound his feet with branches of the myrtle and tamarisk. Apollo, missing his cattle, dragged H. before Zeus, at Olympus, who condemned him to restore them; but Apollo, enchanted by the sound of the newly invented lyre, offered H. his cattle in exchange, gave him his whip or goad, taught him how to tend cattle, and presented him with the caduceus. In the *Iliad* and *Odyssey* are no traces of his thievish propensities, which were introduced by the later poets. In the Gigantomachia he liberated Zeus from Typhon, and restored him his limbs. H. was messenger, herald, and ambassador of the gods; he bound Prometheus to Caucasus; killed Argus with the hundred eyes; liberated the wandering Ió, &c. In the events of the Trojan war, he conducted the goddesses to the fatal judgment of Paris, brought Priam to Achilles, and was patron of Ulysses, to whom he gave the herb *molys*, to liberate him from Circe. Many heroical and other personages were descended from him. As god of the sciences, he invented the alphabet from the flight of cranes, astronomy, and numbers, weights and measures, music, the lyre, and syrinx, gymnastics, tactics, and the cultivation of the olive. Many festivals were celebrated to him in Northern Greece and the islands, as at Phœnea, Cyllene, and Athens; and some of these Hermæa resembled the Saturnalia, slaves being served on these occasions by their masters. His worship, in fact, extended all over the Peloponnesus, the islands of the Ægean, Asia Minor, and even Hesperia or Magna Græcia. Amongst animals, the tortoise, pig, lamb, and goat, and the young of beasts, were sacred to him; the ibis and the gull (*larus*) amongst birds; and the palm-tree, black-thorn, cinque-foil, and purslane amongst plants. H. had a local worship in Samothrace, where he appeared as one of the Cabiri, under the name of Casmilos, the son of Hephaistos

or Vulcan, and Cabira. In the Eleusinian mysteries, he was represented by the hieroceryx.

The idea of H. seems to have been developed from two origins—the ancient Pelasgic or Arcadian god of shepherds, subsequently considered the patron of barter, of commerce, without any trace of intellectual qualities; and the Phœnician or Egyptian H., introduced by commerce into Greece, with all the attributes attributed by the Orientals to their deity. In art, a similar development is seen from the old squared trunks or pillars, called Hermæ and Hermidia, retained till a later period, but by degrees ornamented with a bearded head, to which sometimes are added phallic symbols, the destruction of which at Athens before the sailing of the Sicilian expedition led to a fearful tumult, and the fall of Alcibiades (q. v.). In later, but still archaic art, he is represented bearded, wearing the broad-brimmed petasus, and holding the twisted caduceus. At the time of Phidias, he was represented unbearded, with curly hair, a crafty and charming expression, and the form of an athlete. Instead of the petasus, wings are sometimes arranged in his hair; his boots are winged, and his caduceus has two snakes attached to it. His form is naked, but often has a *chlamys*, or cloak, doubled upon his shoulder, and his hand holds a purse of money; while the cock, referring to his invention of the gymnasium, or the hours of business; the tortoise, allusive of his discovery of the lyre; the palm-tree, emblem of his invention of letters; the goat, referring to his charge of herds, and paternity of Pan; and even the dog, alluding him with Anubis, are placed at his side. The most remarkable type of the god was as carrying a ram upon his shoulders (*criophoros*). The caduceus was gilded at the top, painted blue in the middle, and black at the handle.

The Etruscans seem to have derived his worship directly from the Greeks, and represent him with the same attributes and type, but with the Etruscan name *Turms*, as the Camillus of the gods. His worship passed into Rome, under the name of Mercurius, or Mercury, by which he is more familiarly known, supposed to be derived from *mercari*, to traffic. There was something mystic in his cult, for the *feciales* did not know his nature, and he originally had the laurel instead of the caduceus, and the name of his mother Maia had been given to the month Maius, or May, on the 15th day of which his festival was held. As early as 259 A. U. C., he had a temple near the Circus Maximus, and his statue in that locality held a purse. At the Porta Capena, there was a well sacred to him, and the merchants sprinkled themselves and their goods with the holy-water, obtained by dipping a laurel branch into the well. Tradition made him the father of Evander by the nymph Carmenta, and of Larea by the goddess Lara; but the Romans adopted into their religious system the Greek traditions, although, at a later time, under the empire, the influx of foreign religions made them confound him with the Egyptian Anubis, and even represent him with a dog's or jackal's head, and depict him of a golden or black colour. His worship had even penetrated to Gaul, where he was adored under the name of Teutames.—Grüber, *Altclass. Wörterbuch* Voce; Gerhard, *Griechisch. Mythol.* (8vo Berl. 1854, i. 260); Hartung, *Rel. d. Römer* (8vo Frib. 1843); Birch, *Gall. Antiq.*, pp. 26, 27; Müller, *Arch. d. Kunst*, p. 560.

HERMETIC BOOKS. Amongst the Egyptians, all books or literary compositions appear to have been dedicated to Thoth, and notices of this nature are appended to several papyri. The earlier religious books, such as the Ritual, were supposed to have

been written by the fingers or under the dictation of the god Thoth himself, and several chapters of this and other works are stated to have been found on monuments written by the god. Hence the word hermetic, taken in its most extended sense, meant inspired, as Thoth was the scribe of the gods. Various traditions prevailed as to the number and nature of these books. Clement of Alexandria mentions 42 hermetic books, which contained the sum of all knowledge, whether human or divine; while others, as Iamblichus, raise their number to 20,000; and Manetho gives the astronomical cipher of 36,525. The series of books mentioned by the great authors were: 1. Sacred hymns of Osiris; 2. On the Life of a King; 3—6. Astrological precepts and observations; 7—17. Cosmography, geography, and chorography of Egypt and the Nile; 18—27. Laws, and discipline of priests; 28—33. Medicine. Portions of these books have been undoubtedly found in the hieratic papyri. Under the name of hermetic books, several writings, principally in Greek, have been handed down, which pretend to be translated from the Egyptian, and similar books may have existed in the 2d century. But these books contain notions of the Neo-Platonic school of Porphyry and Iamblichus, and appear to be intended as philosophical works giving an explanation of the genesis of the Cosmos, the nature of God and man, in antagonism to the books of the Old and New Testament, from sources partly Egyptian, partly Persian and Rabbinical, and other traditions of the Alexandrian school. The name of hermetic writings was particularly affected by the alchemists and astrologers of the middle ages, as the *Tractatus Vere Aureus*, by Dominicus Gnostus, in 1610; the *Tabula Smaragdina*, or 'Emerald Table of Alchemy,' in 1541; and various others. The principal tenets of the hermetic books are, that the Creator made the Cosmos by his word out of fluid; that the soul is a union of light and life, and proceeded from the cosmic soul; that death and life are only changes, and that nothing is destructible; that the soul transmigrates; that passion or suffering is the result of motion.—Baumgarten-Cruizius, *de Librorum Hermeticorum Indole* (Jena, 1827); *Hermes Trismegistus*, a Scheible (12mo, Stuttg. 1855); *Hermes Trismegistus* (*Poemander*) a Parthey (8vo, Berol. 1854).

HERMIT (Gr. *eremites*, Lat. *eremita*, an inhabitant of the desert), one of the names given in the early ages, and still more in the later church, to a class of solitary ascetics, who, with a view to more complete freedom from the cares, temptations, and business of the world, withdrew from the ordinary intercourse of life, and took up their abode in natural caverns or rudely formed huts in deserts, forests, mountains, and other solitary places. In the first centuries, the names of Eremita and Anchorite (q. v.) were indiscriminately applied to these solitary; but the word *eremita* having been adopted into Latin, it is more commonly used in the modern languages which are derived from the Latin; and the Germans use the name *Einsiedler*, which is of the same signification. The hermits of the middle ages, like the primitive anchorites, often lived in complete solitude; but a much more common, and, in its influence on the church, more important form of the institute, was that of a community of hermits, each possessing his separate hermitage, but all meeting at stated times for mass, prayer, religious instruction, and other common and public exercises. The various hermits of this class are regarded as constituting religious orders, and although never attaining to the popularity which distinguished the Franciscans, the Capuchins, the Dominicans, and other active orders,

they form, nevertheless, a numerous and not unimportant element in the spiritual life of the Roman Catholic Church. It is beyond the scope of this work to enumerate all the heremital orders. The most remarkable are—the Hermits of St Augustine, who trace their origin to the holy father of that name, but are subdivided into several varieties, which had their rise in the 11th, 12th, and 13th centuries; the Camaldolese, founded by St Romuald in 1012; the Celestines, a branch of the Franciscans, established by Peter Murrone, afterwards Pope Celestine V.; the Hieronymites (q. v.), established first in Castile in the 14th c., and thence introduced into other parts of Spain and into Italy by Lope d'Olmeda in 1424; and the Paulites, so called from St Paul, the first hermit, but an institute of the 13th c., which had its origin in Hungary, and attained to a wider extension and a greater popularity than perhaps any other among the heremital orders.—See Helyot, *Histoire des Ordres Religieux*; also Wetser, *Kirchen-Lexicon*, art. *Einsiedler*.

HERMIT CRAB, the common appellation of a large family (*Paguridae*) of crustaceans, of the order *Decapoda*, and sub-order *Anomoura* (see **CRAB**), having the abdominal or tail segments much more largely developed than in true crabs, but undefended by hard plates, and not forming an organ for swimming, as in lobsters, prawns, and other *Macroura*. The soft and tender tail requires a protective covering, which the instinct of the hermit crabs leads them to find in some turbinated univalve shell of suitable size. The most common British species (*Pagurus Bernhardus*) is an interesting

Hermit Crab (*Pagurus Bernhardus*):
a, animal out of the shell; b, in shell; c, a jaw-foot.

object to every visitor of the sea-shore, and may be found in abundance wherever little pools are left by the tide on a rocky or shelving coast. Shells of whelks, periwinkles, &c., may be seen moving about in the pools in a manner very different from that in which they were carried by their original molluscous owners, having now become the property and habitations of hermit crabs, by which, perhaps, the molluscs were eaten. On the slightest alarm, the H. C. retires into the shell, guarding the aperture of it with one claw, which is much larger than the other, the hard points of the feet also projecting a little. The whole structure of the animal is adapted to such a habitation. The part which in the lobster becomes a finlike expansion at the end of the tail, becomes in the H. C. an appendage for firmly holding by the shell; and so firmly does the

H. C. hold, that it may be pulled in pieces, but cannot be pulled out. Some species have suckers to render the hold more perfect. Increase of size, however, renders it necessary for hermit crabs to relinquish their old shells and seek new ones. Hermit crabs are very interesting inmates of the aquarium, but their locomotive habits and their voracity make them unsuitable for an aquarium otherwise very finely stocked. They feed on molluscs, and on all the animal garbage of the sea-shore.—Some of the hermit crabs of warmer climates are much larger than the British species; some of them (genus *Cenobita*) inhabit land-shells, and some are found even at a distance from the sea.

HERMITAGE, the cell or hut of a single hermit, and sometimes the aggregate of the cells occupied by the members of a single community. Many of these, from the reputation of their inmates, or as being the scenes of certain popular miraculous legends, attained great celebrity, and became the nuclei of important ecclesiastical establishments, and, in some instances, large and populous cities.

HERMODACTYL (Gr. *Hermes*, Mercury, and *dactylos*, a finger) is the name of a medicine that had a high repute among the later Greek and the Arabian physicians, as a remedy for gout and rheumatism. It is mentioned by Alexander of Tralles, who flourished 560 A.D.; Paulus Aegineta, who lived a century later; Avicenna, Serapion, &c. By some of the old writers, it was termed *anima articularum*, or the soul of the joints. Corms, probably of several species of colchicum, are still sold in Greece and in the East under the name of hermodactyls. While Sir H. Halford and others have advocated the view that hermodactyls are the corms of *Colchicum autumnale*, different botanists and pharmacologists have referred them to *C. illyricum*, *C. variegatum*, *C. bulbocodioides*, &c. No modern experiments have been made to determine the activity of hermodactyl, and the subject is one rather of historical than of practical interest.

HERNIA, in its widest sense, signifies a protrusion, through an abnormal or accidental opening, of any organ from its natural cavity. Although hernia may occur in many parts of the body, the word, used by itself, is restricted to signify protrusion of the abdominal viscera.

The way in which hernia may arise will be readily understood, if we bear in mind that the abdominal viscera are subject to violent pressure from the diaphragm and other surrounding muscles. This pressure forces them outwards and downwards against the walls of the belly; and if at any point these walls are not sufficiently strong to resist this pressure, some portion of the viscera is driven through them, and a hernial tumour is formed. Certain parts of the abdominal walls, especially the inguinal and crural rings, and the umbilicus, being weaker than others, hernia most frequently occurs at these points. In some instances hernia is congenital, as from abnormal deficiency of the walls; in other cases, it may arise at any period of life as a result of violent bodily exertion. Sex, age, and occupation seem to have a marked influence in predisposing to hernia. Men are far more liable (in about the proportion of four to one) to this disease than women; though they are less so to those forms of the affection known as femoral and umbilical hernia. According to Malgaigne, in France, one man in thirteen, and one woman in fifty-two, are the subjects of hernia. In respect of age, he found that the liability is least about the age of thirteen (1 in 77), after which it progressively increases until the close of life, rising at 70—75 to 1 in 3.

A hernia is almost always composed of a sac and its contents. The sac is a portion of the Peritoneum (q. v.) corresponding to the aperture at which the hernia protrudes. It is pushed forward by the protruding viscera, and forms a pouch. The contents vary greatly, but generally consist of a portion of the small intestine (particularly of the ileum), forming the variety of hernia known as *enterocoele*. Omentum is often found in hernial sacs, together with intestine. Besides the viscera, the sac always contains a certain quantity of fluid secreted by its interior. Hernia is divisible (1) into *reducible*, or returnable into the abdomen, *irreducible*, and *strangulated*; and (2) according to its situation, into *inguinal*, *crural*, &c.

The treatment of reducible hernia may be palliative or radical. The palliative treatment consists in the application of a Truss (q. v.) to retain the protrusion within the cavity of the abdomen. Each particular kind of hernia (femoral, crural, &c.) requires its special form of truss; and before applying it, the hernia must be reduced by placing the patient on his back, relaxing the muscles by bending the thigh upon the abdomen, and pressing the tumour back in the proper direction. The truss should then be put on, and should be worn during the whole of the day; and if the patient will submit to wear it (or a lighter one) during the night, so much the better. The means that have been contrived to effect a radical cure are too purely surgical for description in these pages. Below the age of puberty, and if the hernia is recent, a radical cure is sometimes effected by wearing the truss for two or three years.

In irreducible hernia the protruded viscera cannot be returned into the abdomen, but there is no impediment to the passage of their contents or to their circulation. In these cases, the patient is often liable to dragging pains in the abdomen, and to attacks of vomiting, in consequence of the movements of the stomach being checked by the omentum or intestines being fixed. There is also constant danger of this hernia passing into the strangulated form. The treatment may be either palliative or radical. The palliative treatment consists in the employment of a truss with a hollow pad that shall embrace the hernia, and prevent any additional protrusion. A radical cure may *sometimes* be obtained by keeping the patient in the recumbent position, and on very low diet, for two or three months; at the same time keeping the bowels open by laxatives and injections, and maintaining equable pressure over the tumour.

Hernia is said to be strangulated when a portion of intestine or omentum that is protruded is so tightly constricted that it not only cannot be returned into the abdomen, but has its circulation arrested. This form is highly dangerous, because, if relief is not speedily afforded, the strangulated part becomes gangrenous. The causes of strangulation are various, but this condition most commonly arises from a sudden violent effort, by which a fresh portion of intestine is driven into a pre-existing hernia, which it distends to such a degree as to produce this complication. The most prominent early symptoms are flatulence, colicky pains, &c. They are succeeded by vomiting first of the contents of the stomach, then of mucus and bile, and lastly of faecal matters, owing to inverted peristaltic action. If relief is not obtained, the inflammation that commences in the sac extends to the peritoneum, and the ordinary signs of peritonitis appear. After a variable time, comes gangrene or mortification of the part, and the patient speedily sinks.

The surgeon first tries to return the intestine, as in the preceding cases. This manipulation, termed the taxis, may be assisted by the internal use of

chloroform, inhaled till it produces complete relaxation of the muscle, by general bleeding to the verge of faintness, by the hot bath, &c. If this fails, he must have recourse to the knife to divide the constriction.

HERO, a priestess of Venus, celebrated for her love for Leander. At a festival of Venus and Adonis, held at Sestos on the Thracian coast, H. and Leander first saw each other, and were immediately inspired with a mutual passion. H.'s position as a priestess, and the will of her parents, opposed their union. Undaunted by these obstacles, Leander every night swam across the Hellespont to visit his beloved, who directed his course by holding a burning torch from the top of a tower on the sea-shore. After many interviews, Leander was drowned in a tempestuous night, and was cast on shore at the foot of the tower, where H. anxiously awaited him. At the sight of the body, she threw herself from the tower. A poem has come down to us under the name of Musæus, in which this story is sung; Schiller likewise has made it the subject of a beautiful ballad.

HERO, or HERON, commonly known as HERO of ALEXANDRIA, was a pupil of Ctesibius, and flourished 284—221 B.C. He was a celebrated mathematician and natural philosopher, and displayed, especially in the latter subject, a most original and inventive genius. He constructed a great number of machines and automata—rather, however, as toys, than for the purpose of applying them to any useful purpose—among which are *Hero's Fountain* (q. v.); a *steam-engine* on the principle of Barker's mill (a vessel being caused to revolve by jets of steam issuing from lateral holes in the arms with which it is provided); a double forcing-pump used for a *Fire-engine* (q. v.), and various other similar applications of air and steam. It is but recently that the remarkable claims of H. to such discoveries have received any notice, for in the valuable work of M. Duten, entitled *L'Origine des Découvertes attribuées aux Modernes*, the name of H. is not even mentioned. Among his works which have come down to us are *Pneumatika*, his most valuable work, in which the above-mentioned machines and many others are figured and described; *Belopoitika* (on the manufacture of darts), and *Cheiroballistrias Kataskeuē* (also on warlike instruments); *Peri Automatopoitikōn* (on the construction of automata). All these works are merely fragments, and an acquaintance with them causes us to regard with the greater regret the loss of the rest. The best edition of his works is that published in the *Vetorum Mathematicorum Opera* (Paris, 1693).

HEROD, the name of a family which rose to power in Judea during the period which immediately preceded the complete destruction of the Jewish nationality. The family was of Idumean descent; but, though alien in blood, was Jewish in religion, the Idumeans having been conquered and converted to Judaism by John Hyrcanus, 130 B.C. The most remarkable rulers of the name are four in number—Herod the Great, Herod Antipas, and Herod Agrippa I. and II. (for the two last, see AGRIPPA). I. HEROD THE GREAT. He was the second son of Antipater, who was appointed procurator of Judea by Julius Cæsar 47 B.C. At the time of his father's elevation, H., though only 15 years of age, was made governor of Galilee, and afterwards of Coele-Syria; and finally, he and his elder brother were made joint-tetrarchs of Judea; but he was soon displaced by Antigonus, the representative of the Asmonean dynasty, and forced to flee to Rome, where he obtained, through the patronage of Antony, a full recognition of his

claims, together with the title of king of Judea, 40 B.C. Several years elapsed, however, before he succeeded in establishing himself in Jerusalem. On the fall of Antony, he managed to secure a continuance of favour from Augustus, from whom he not only obtained a confirmation of his title to the kingdom, but also a considerable accession of territory, 31 B.C. From this time till his death, his reign was undisturbed by foreign war; but it was stained with cruelties and atrocities of a character almost without parallel in history. Every member of the Asmonean family, and even those of his own blood, fell in succession a sacrifice to his jealous fears; and in the latter years of his life, the lightest shade of suspicion sufficed as the ground for his wholesale butcheries, which are related in detail by Josephus. Of these, the one with which we are best acquainted is the slaughter of the infants at Bethlehem. The one eminent quality by which H. was distinguished, was his love of magnificence in architecture, and the grandeur of the public works executed under his direction. Even by these, however, he alienated the Jews, who ascribed them all to his Gentile leanings, and to a covert design of subverting the national religion. H. married no fewer than ten wives, by whom he had fourteen children. He died of a loathsome disease at the age of 70, after a reign of 37 years.

—2. HEROD ANTIPAS, son of H. the Great by his wife Malthace, a Samaritan, was originally designed by his father as his successor; but by the final arrangements of the will of H. the Great, Antipas was named tetrarch of Galilee and Perea. He divorced his first wife, the daughter of Aretas, king of Arabia Petrea, in order to marry Herodias, the wife of his half-brother Philip—an incestuous connection, against which John the Baptist remonstrated, and was in consequence put to death. It was during a visit of H. Antipas to Jerusalem for the purpose of celebrating the passover, that our Lord, as having been a resident of his tetrarchate, was sent before him by Pilate for examination. At a later time, he made a journey to Rome, in the hope of obtaining the title of king; but he not only failed in this design, but, through the intrigues of H. Agrippa, was banished to Lugdunum (Lyon), where he died in exile.

HERODOTUS, the oldest Greek historian, and for this reason usually styled the 'Father of History,' was born at Halicarnassus, in Caria, 484 B.C. He appears to have early formed the resolution of writing a historical work on an extensive scale, and with this view determined to visit and observe with his own eyes the most remote countries and nations. Although the dates and extent of his travels are involved in obscurity, and sometimes even in contradictions in the ancient narratives, we gather from his own statements that in his early youth he visited the islands and coasts of Asia Minor; that subsequently he devoted particular attention to Egypt, which was at that time little known; that he next visited Palestine and Phœnicia; and finally penetrated as far east as Babylon and Susa. We are also informed that he sailed through the Hellespont into the Black Sea, and visited all the countries situated on its shores. After his return, he appears to have resided for a time at Athens. He speaks of having seen the *Propylæa*—i. e., the entrances to the Acropolis, which were not finished till the outbreak of the Peloponnesian war (431 B.C.). He also interested himself warmly in the politics of his native city, was instrumental in delivering it from the tyranny of Lygdamis, a vassal of Persia; but being what we should call 'a moderate liberal,' he had the misfortune to offend the extreme or popular party,

and in consequence withdrew to Thurii, in Italy, whither many of his fellow-citizens had previously proceeded. Here, in all probability, he wrote his immortal work in the decline of his life. Lucian, an indifferent authority on such a subject, states that about the year 456 B. C., he read the nine books before the Greeks assembled at the Olympic games, but this is contradicted by the numerous allusions in the History to incidents of later occurrence—for example, the revolt of the Medes against Darius Nothus (409—408 B. C.). The statement of Pliny, that it was composed in his old age at Thurii, is the most probable, and it best agrees with the unfinished programme of the work, and its abrupt termination, as if the author were prevented by death from finishing it as he intended. According to Suidas, he died and was buried at Thurii about 408 B. C.

The purpose of H. in his History is to describe the war between the Persians and the Greeks—the struggle for supremacy between Europe and Asia, between civilisation and barbarism, between freedom and despotism. H., wishing to indicate that the antipathy between the two was not the result of any accidental quarrel, but of a deep-rooted difference of character, traces it back to the mythical ages. This was the only way in which a man in his time could express what we mean when we speak of the differences of *race*. In the course of his History, he gives an account of the various countries which he had visited. Wherever he gives the results of his own observations and inquiries, he exhibits a wonderful accuracy and impartiality; and when he does not do this, he is generally careful to say so. He has been accused of credulity, and it is certain that he too readily accepted statements on the authority of others, but that he was personally a keen intelligent observer of what he saw is beyond all dispute. H. wrote in the Ionic dialect, but Attic, Doric, and epic forms occur in his work. The style is marked by an easy grace and lively vigour, and everywhere there is the presence of a reverent spirit, giving a certain air of moral dignity to the entire composition. The first edition (in Latin), by Laurentius Valla, appeared at Venice in 1474; the first in the original Greek at Venice in 1502. The chief modern editions are those of Schweighauser (6 vols. Strasb. and Paris, 1806), Gaisford (4 vols. Oxford, 1824), Bähr (Leip. 1830—1834), and Müller (Paris, 1844). The best school editions are those of Matthiæ (2 vols. Leip. 1825), Bekker (Berlin, 1833 and 1845); G. Long (Lond. 1830), and Negris (Edin. 1834). A variety of translations of the writings of H. have likewise been published, as well as of historical and geographical treatises calculated to facilitate the study of the celebrated historian.

HEROES were, in the Homeric period, the kings, princes, generals, leaders, all brave warriors, and men who excelled in strength, courage, wisdom, and experience. Many of these had, on account of such qualities, a fabled origin, half human, half divine, and were honoured, after their death, with a kind of adoration or inferior worship. These heroes and demigods were recognised as the special patrons or protectors of particular countries and cities, and to them were raised temples and altars. These examples of heroic character, held up constantly to the admiration and imitation of peoples, tended to strengthen their peculiar character, and to impress them with the greatness and glory of courage, contempt of danger, and nobility of purpose. Poetry exalted the heroic sentiment to sublimity; and poems which celebrated the deeds of heroes, are themselves termed heroic. The imaginary time when heroes and other semi-

divine beings lived on earth was called the HEROIC AGE. See AGES.

HEROIC VERSE. See METRE, VERSE.

HERON (*Ardea*), a genus of birds, of the order *Grallatores*, tribe *Cultrirostres*, and family *Ardeidae*. This family includes also Bitterns, Night Herons, Spoonbills, Boatbills, Storks, Adjutants, Ibises, &c. The bill is long, compressed, and sharp; the tail short; the legs and the toes long and slender; the wings long. In the herons—in which genus are included the species commonly designated EGRETS (q. v.), which differ only in unimportant particulars of plumage—the bill is slender, but strong, forming a compressed and lengthened cone; the plumage is beautiful, but seldom exhibits very gay colours; white, brown, black, and slate colour, finely blended, being generally predominant. The body is small in proportion to the length of the neck and limbs; the neck is long, and, except in flight, is usually held curved. In flight, the H. carries the neck, head, and long bill in a straight line before the body, and the long legs in like manner stretched out behind. Herons feed mostly on fish, frogs, and other aquatic animals; and may be seen, particularly very early in the morning and late in the evening, standing patiently motionless in some shallow water, at the margin of a lake or stream, or on the sea-shore, waiting till prey come within reach. In default of their more common food, however, herons sometimes prey on young birds, reptiles, and the smaller mammalia. They usually go forth singly in quest of prey, but are mostly gregarious in their nidification.—The COMMON H. (*A. cinerea*) is about three feet in length

Common Heron (*Ardea cinerea*).

from the point of the bill to the end of the tail. It is of a delicate gray colour on the upper parts, except the quill-feathers, which are black, and the tail, which is deep slate colour. The Common H. generally builds its nest in a high tree, and many nests are sometimes to be seen in a single tree. Pennant tells us that he counted 80 in one oak in Lincolnshire. In very northern parts of the world, the H. is known only as a summer bird-of-passage, but it remains in Britain all the year. Its geographical range extends over most parts of Europe and Asia, and includes the north of Africa. The H. was formerly in great esteem for the table, although now disregarded; it was also the kind of game most of all pursued in falconry; and the English act,

19 Henry VII. c. 11, prohibited the killing or taking of herons, except by hawking, or with the long-bow. This act was not repealed till the game act of Geo. IV.—The PURPLE H. (*A. purpurea*) is a smaller and much rarer British species.—The GREAT WHITE H., or GREAT EGRET (*A. alba*), a mere accidental visitor of Britain and of the western parts of Europe, is more common in Turkey, Greece, &c., and in some parts of Asia. It is an extremely beautiful bird, with perfectly white plumage, much of it loose and flowing.—The LITTLE EGRET (*A. garzetta*) has also white flowing plumage. It is only about two feet in length.—America has many species of H., most numerous in its warmer regions. The most common species in the temperate parts of North America is the GREEN H. (*A. virescens*), the flesh of which is so much esteemed that it is often to be seen in the markets.

Heron and egret plumes, made of the long feathers, were in former times highly valued, being, in some countries, deemed an ornament fit for royal personages, or for the highest nobles.

HEROPHILUS, one of the greatest physicians of antiquity, was born at Chalcon, in Bithynia, and flourished in the 4th and 3d centuries, B.C. He settled at Alexandria, and distinguished himself in particular by his devotion to anatomy. In fact, he is said to have pursued this to such an extent as to have dissected criminals alive. Several names which he gave to different parts of the body are still in use, as the 'Torcular Herophili,' the 'Calamus scriptorius,' and the 'Duodenum.' H. placed the seat of the soul in the ventricles of the brain. Of his writings, only a few fragments remain, which have been collected and published in a dissertation entitled *De Herophili Celeberrimi Medici Vita, scriptis, atque in Medicina Meritis* (Gött. 1840).

HERO'S FOUNTAIN, a pneumatic apparatus, through which a jet of water is supported by condensed air. A simple mode of constructing it by means of glass tubes and a glass-blower's lamp is shewn in the annexed figure. The column of water in the tube *a*, compresses

the air in *b*; this presses on the surface of the water in *c*, and causes it to gush out at *d*.

HERO'S TRATUS, an Ephesian, who, from a desire of future fame, set fire to the magnificent temple of Diana, in 356 B.C. He expiated the deed by a painful death; and, by a decree of the Ionians, capital punishment was to be inflicted upon any one who should mention his name; a decree which produced an effect directly the reverse of what had been intended. The temple is said to have been set on fire on the night that Alexander the Great was born.

HERPES, a variety of disease of the skin, characterised by vesicles, sometimes as large as a split-pea, occurring in clusters on an inflamed base, and ending in desquamation, after a course of a few days or weeks. In herpes zoster, or zona, the largest and most marked variety of the disease, there is the additional peculiarity, that it extends in patches around one side of the body, usually passing sharply up to the middle line, but not beyond it either before or behind. Herpes phlyctenodes, zoster, labialis, præputialis, circinatus, are the varieties of this

disease most commonly met with in practice. The treatment is by soothing and cooling applications; there is no danger; but the smarting during the eruptive period, and the itching afterwards, are often very distressing to the patient, and may be somewhat relieved by the application of cold cream, and other simple soothing external applications.

HERPETOLOGY (Gr. *herpēton*, a reptile, and *logos*, a discourse), that branch of natural history which treats of reptiles. The Batrachians or Amphibia having, till recently, been included by naturalists generally—as they still are by many—in the class of Reptiles, the science of herpetology may be regarded as including the study of them. This branch of natural history received a share of attention from the naturalists of antiquity and the earlier naturalists of modern times. The name most deserving of notice in connection with it before the time of Linnaeus is that of Ray. In the end of the 18th c. and beginning of the 19th, H. received special attention from Lacépède, Brongniart, Latreille, and Daudin, all of whom, as well as Cuvier, contributed greatly to its progress. More recently, it has been much advanced by the labours of Schlegel, Fitzinger, J. E. Gray, Müller, Owen, &c. The work of Spix on the *Reptiles of Brazil* is one of the most important contributions to herpetology. Bell's *History of British Reptiles* (Lond. 1839) contains a very full account of all the British species, including the Batrachians. This branch of natural history derives great additional interest from the numerous fossil remains of reptiles of former geological periods, and from the great size and extraordinary characters of many of them.

HERRE'RA, ANTONIO, one of the most eminent historians of Spain, was born at Cuellar, in the year 1549, and died at Madrid, 1625. His principal work is the *Historia general de los Hechos de los Castellanos en las Islas y Tierra Firme del Mar Oceano* 1492—1554 (4 vols. Madrid, 1601—1615), which was afterwards published with continuations by Andr. Gonzalez de Barcia (4 vols. Madrid, 1728—1730). His *Descripcion de las Indias occidentales* (Madrid, 1601 and 1615) forms an introduction to the above work. His other works, which are no less valuable, are the *Historia del Mundo en el Reynado del Rey D. Felipe II.*, 1554—1598 (3 vols. Madrid, 1601—1612); *Comentarios de los Hechos de los Españoles, Franceses y Venecianos en Italia*, 1281—1559 (Madrid, 1624); and the *Historia de Portugal y Conquista de las Islas de los Acores* 1582 y 1583 (Madrid, 1591).

HERRERA, FERNANDO DE, a Spanish poet, was born at Seville, in the beginning of the 16th century. When advanced in life, he took orders, and died in 1589. He was master of the Greek, Roman, and Italian literatures, and was a man of prodigious learning. As a poet, he ranked so high, in the opinion of his contemporaries, that they bestowed upon him the appellation of the *divine*. Among his poetical works still extant, many of his erotic poems are remarkable for tender feeling; while his odes frequently display a lofty enthusiasm, but the expression is cast in too classical a mould, and consequently wears a certain air of artificiality. His *Obras en Verso* were published by Pacheco (Seville, 1582), and subsequently under the title *Versos* (Seville, 1619). They were republished in the *Colección de Ramon Fernandez* (Madrid, 1786; new edit. 1808). His principal historical work is the *Relacion de la Guerra de Chipre* (Seville, 1572); and he also translated from the Latin of Stapleton a life of Sir Thomas More.

HERRERA, FRANCESCO, EL VIEJO, i.e., the Elder, one of the most eminent Spanish painters of

Hero's Fountain.

the school of Seville, was born in that city about the year 1576. He was the first to lay aside that timidity in the use of the brush which we observe in the works of the older Andalusian painters. His drawing was bold and spirited, for which reason he may justly be regarded as the founder of a new and more national school. His 'Last Judgment,' painted for the church of St Bernard at Seville, is a master-piece of drawing and colouring. The 'Holy Family,' and 'Outpouring of the Holy Spirit,' in the church of Sta. Ines, in Seville, are also much esteemed. The cupola of the church of Sta. Bonaventura displays his skill in fresco-painting. He likewise worked in bronze, a circumstance which may have led to the imputation cast upon him of coining false money. He died at Madrid in the year 1656. His easel-paintings and reed-drawings fetch very high prices. Some of his best works are in the Louvre at Paris.—His youngest son, FRANCESCO HERRERA, EL MOZO (the Younger), was born at Seville in 1622. He studied under his father, and afterwards went to Rome, where he became so celebrated for his fish-pieces, that he received the surname of *Il Spagnuolo degli Pesci*. After his father's death, he returned to Seville, and painted for the churches. He subsequently went to Madrid, where he painted the dome of the choir of Sta. Felipe and the chapel of Our Lady of Atocha, and died in 1685.—There have been several other artists of the same name, but of less note.

HERRING (*Clupea harengus*), a fish of the malacopterus family *Clupeidae* (q. v.); the most important to mankind of all species of fish. The genus *Clupea* is distinguished from others of the same family chiefly by the fins and by the teeth, which are small and numerous, and are situated not only on the jaws, but in other parts of the mouth, as the *vomer* (middle line of the palate) and the tongue. The H., of which we think it unnecessary to give any description, is found in the seas of the northern parts of the world, but more abundantly in those of temperate than of arctic regions. The opinion, once entertained, that its proper home is within the Arctic Circle, and that its vast shoals issue thence at certain seasons, migrating southward, and spreading themselves along the British and other coasts, is now discarded as utterly without foundation; and the H. is believed to be an inhabitant of deep water, from which, at certain seasons, it approaches the shores, probably never migrating to any great distance. The young are abundant in the shallow water near the shores at seasons when the parent fish are absent. The H. seems always to deposit its spawn in comparatively shallow water, and is said to be very indifferent whether the spawning-ground be sandy, rocky, or covered with submarine vegetation. Certain localities, however, have the reputation of being favourite spawning-grounds. When the great annual shoals of herrings appear on the coasts, they generally swim near the surface of the water, and are followed by multitudes of larger fishes, as hakes, dog-fishes, &c., which prey on them; great numbers also fall a ready prey to gulls and other sea-birds, which congregate for the occasion. The food of the H. is believed to consist chiefly of minute crustaceans and *acalephæ*; but it feeds also on small fishes, not scrupling to devour even the young of its own species. Herrings are sometimes, though rarely, caught on the lines set for other fishes, and by persons angling from the shore; they are readily caught by means of a lure made of a white feather, which swims at the depth of some yards, the point of the fishing-rod being kept a yard or two below the surface of the water, the angler being in a boat which is in motion. The immense multitudes of

herrings annually taken by the net cause no apparent diminution of their abundance, the destruction being compensated for by prodigious fecundity; more than 68,000 eggs have been counted in the roe of a single female. But herrings, without any apparent cause, often desert parts of the coast where for a time they have been remarkably abundant, not returning again in similar plenty till after the lapse of a number of years. Some instances of this kind, in the western parts of Scotland, were popularly ascribed to steam-boats, when these first began to ply. The magnitude of the shoals of herrings is often enormous, and they have sometimes even been driven ashore in far greater quantities than the inhabitants of the neighbourhood could find means of curing. An instance of this kind occurred, before the days of railways, at Crail in Fife. The water, as the tide came in, was so full of herrings, that half-a-dozen could be taken out at one dip of a basket. Finally, they were stranded and left by the retiring tide in such numbers, that when all the salt within reach was exhausted, the magistrates had to offer a shilling a cart for their removal as a nuisance.

There is evidence that the herring-fishery has been prosecuted in England since the beginning of the 8th c., and in Normandy since the 11th. Nor is it probable that in either case the date is that of its commencement. The prosperity of Holland is in a great measure owing to the herring-fishery, and the Dutch engaged in it with great eagerness, and carried it on even on the British coasts, at a time when it was comparatively neglected both by English and Scotch.

Another species of H. (*C. Leachii*) is occasionally found on the British coasts. It is rather smaller than the common H., and the body is much deeper in proportion to its length. It is of particularly delicate flavour.—The seas of other parts of the world produce a number of other species of the genus *Clupea*, as now restricted by ichthyologists. The other British *Clupeidae* are now referred to other genera.

The fishes popularly called *Freshwater Herrings* are *Salmonidae* of the genus *Coregonus* (q. v.), to which also belong the *Herring Salmon*s of the North American lakes and rivers. All of them are esteemed for the table.

HERRING-FISHERY. The herring-fishery is carried on all the year round, there being both a winter and a summer fishery; but the largest quantities of fish are caught in the months of August and September, at which time the fishery becomes general on all parts of the British coasts.

The common mode of capturing herrings is by a set of large nets joined together, and known among fishermen as a 'drift.' These nets, held together by a back-rope, are let into the water in a straight line, and are kept perpendicular by a number of bladders or cork floats, balanced by a few slight weights of lead. Each single net is composed of fine twine worked into meshes of an inch square, and is 50 yards long and 33 feet in depth. These nets, which are now woven by machinery, were formerly made by the fishermen's families; but so many are used now, that it would be impossible to make them by hand, as each boat has a train that extends nearly a mile in length.

The herring-fishery in Scotland is regulated by acts of parliament, and watched over by the Commissioners for the British Fisheries. This Board will allow of no other method of taking the fish than by a drift-net. Another mode of fishing, known as 'trawling,' but which is in reality carried on by means of a 'seine'-net, prevails on some parts of the British coast; but in Scotland, trawling is illegal, and subjects those who practise it to heavy penalties.

The boats required in the herring-fishery in Scotland, although open or undecked, require to be of considerable size, in order to contain the large quantity of nets which are used, as well as to bring home the fish that may be taken; the fishermen also believe that the open boats are more convenient for the manipulation of the nets. Most of the boats used in Scotland are obtained from the port of Leith, which has long been celebrated for the build of its open fishing-boats. Each vessel is manned by a crew of five or six persons, one to guide the boat, and the others to manœuvre the sails, nets, &c. The boat usually belongs to one person, who hires his assistants, or, as in some cases, may be owned by two or three relatives, who form themselves into a crew, and share in the proceeds of the capture. The boats of a district usually gather to a particular centre, for the convenience of the curers. Some fishermen will proceed a hundred miles or more to a favourite port, and many of the curers have curing-stations at five or six different places. The boats proceed to sea so as to arrive at the place selected for casting the nets about sunset, when the sail is struck, and the nets are gently paid over the boat, which requires to be kept in motion during the process. The last portion of the nets is fixed to the boat by a long swing-rope, and when the whole train has been let into the sea, the fishermen go to rest; the boats and nets being allowed to drift with the tide. The herrings are caught by striking against the nets, in which they entangle themselves by the head. The herring-fishery partakes greatly of the nature of a lottery. A boat will sometimes obtain a large quantity of herrings, and as frequently take only a few; sometimes the nets are shot twice in a night, if no fish are got on the first trial.

The commerce carried on in herrings is peculiar. The fish when brought on shore are measured ungutted by the 'cran,' a vessel which contains 45 gallons, and handed over to the curer. A very large proportion of the herrings taken on the British coast are pickled or cured by means of salt; owing to the facilities for speedy transport afforded by railways, however, great quantities are also disposed of fresh. At Yarmouth, and some other parts of England, and also at some places in Scotland, the herrings are, after being slightly salted, made into what are called 'bloaters,' by means of smoking. A large portion of the total catch is likewise made into 'reds' by a more complete smoking, and both kinds are in great demand. Smoking-houses are now numerous in many parts of Scotland.

The chief buyers of the fresh fish are known as curers; they provide salt, barrels, and labour, for the curing and packing of the fish. The curer, who is usually a person of considerable capital, contracts with the owners of the boats for a certain quantity of fish, usually 200 crans, for which he pays at a rate which has been arranged for long before the commencement of the fishery. In addition to a specified price per cran, a sum of money is usually paid down by way of bounty, and various privileges, such as dye-stuffs and drying-ground for nets, a few gallons of whisky, &c., are agreed for as well. Some curers will have as many as 250 boats fishing for them on various parts of the coast. The herrings are cured (in Scotland) under the inspection of an officer, and each barrel, if cured according to the instructions laid down by the Fishery Board, is entitled, on the payment of a small fee, to be marked with the government brand, as a mark of its quality. A large number of women are employed to gut and pack the fish, which they do with astonishing dexterity. The excitement and bustle at a large fishing-port during the herring season are remarkable, large numbers of people being employed

in the various industries incidental to the capture and cure of the herrings. Amsterdam is said to have been built on herring-bones; but the Dutch herring-fishery, once of great magnitude, has been exceeded by that of Scotland, which is the largest in the world, and from which cured herrings are exported to the continent of Europe and to Ireland, and other countries, in large quantities. The only official statistics of the herring-fishery in Great Britain relate to the fishery in Scotland and the Isle of Man; these are issued annually by the Commissioners of the British Fisheries. No account is kept of the quantity of herrings caught on the English coast, nor is there any authentic statistics of the number or value of the boats engaged in this branch of the fishery.

From the most recent returns, it appears that there are 92,000 people employed in the various departments of the Scottish herring and other fisheries, and that the number of herring-boats in use at the various stations in 1861 was 12,961, representing in value a sum of £296,224; the value of the nets in use for the same period being £415,057. The report of the Fishery Commissioners for Ireland does not afford information on these points, and the details of the English herring-fishery cannot be separated from those of other branches of the fishery business.

Herring-fisheries have always been the subject of legislative protection in the United Kingdom, being considered a valuable branch of public industry. In 1860, an act of parliament, 23 and 24 Vict. c. 92, passed to regulate the Scotch herring-fisheries. By that act, the Commissioners of the British White-herring Fishery may appoint a close season in some parts of the Scotch coast, there being a close season also fixed from January to May inclusive, as to the principal parts of the coast. The kind of fishing-boats and nets employed in the fishery is subjected to regulation. A penalty is incurred by selling fresh herrings during close time, 24 and 25 Vict. c. 72. The following are the more recent acts for the encouragement and regulation of the British White-herring Fishery, 48 Geo. III. c. 110, 51 Geo. III. c. 101, 52 Geo. III. c. 153, 54 Geo. III. c. 102, 55 Geo. III. c. 94, 1 Geo. IV. c. 103, 1 and 2 Geo. IV. c. 79, 5 Geo. IV. c. 64, 7 Geo. IV. c. 34, 1 Will. IV. c. 54, 6 and 7 Vict. c. 79, 10 and 11 Vict. c. 91, 14 and 15 Vict. c. 26, 23 and 24 Vict. c. 92, 24 and 25 Vict. c. 72. See FISHERIES.

HERRING SILVER, a composition in money, in lieu of supplying a religious house with a certain number of herrings.

HERRISON (Fr. *hérisson*), in Heraldry, the hedgehog, a charge allusively borne by families of the name of Harris.

HERRNHUT, a small town in the circle of Bautzen, kingdom of Saxony, about 50 miles east of Dresden. It is pleasantly situated on the southern slope of the Hutberg, from which it takes its name, and is noted throughout Germany for its fine and durable manufactures, particularly linen, japanned wares, and leather. H. is also remarkable for the regularity and simplicity of its architecture, and the inhabitants for their cleanliness, freedom from all ostentation, and quiet deportment. Pop. about 1100. H. was founded in 1722 by a colony of persecuted Moravians, some of whom were descended from the old Bohemian and Moravian Brethren. On coming into Saxony, they were sheltered and protected by the pious Count Zinzendorf, to whom H. belonged. From this place the United Brethren, better known as Moravians, have spread themselves over all parts of the world.

HERSCHEL, SIR WILLIAM, born at Hanover, November 15, 1738, was the son of a musician, and was educated specially as a professional musician. In 1757 he went to England, where he became a teacher of music in the town of Leeds, from which he went to Halifax as organist, and subsequently (1766) in the same capacity to Bath. Here he would seem to have first turned his attention to astronomy. Wanting a telescope, and unable to afford a reflector, he made one for himself—a Newtonian, of five feet focal length, and with this applied himself to study the heavens. In 1780, he made his first discovery (*Philos. Trans.* 1780—1781), being a new planet, which at first he took for a comet. It was detected by an exhaustive process of surveying the heavens, which H. was the first to follow, taking the stars in regular series, and examining them all in their groups through the same instrument. The result of his discovery was his appointment to be private astronomer to George III., with a salary of £400 a year. He then went to live at Slough, near Windsor, where, assisted by his sister Caroline (q.v.), he continued his researches. H. married a Mrs Mary Pitt, and left one son, John (q.v.). Little is known of his private life. He was knighted by George III., and made a D.C.L. by the university of Oxford; he became rich partly through his wife's jointure, and partly through selling mirrors for reflecting telescopes. He died at Slough, 23d August 1822.

H. contributed 69 papers to the *Philos. Trans.* between the years 1780 and 1815; and to the 1st vol. of *Mem. of the Astron. Society*, he contributed a paper, 'On the Places of 145 New Double Stars.' He greatly added to our knowledge of the solar system: he discovered Uranus and its six satellites, and two satellites of Saturn. Besides this, he detected the rotation of Saturn's ring, the period of rotation of Saturn itself and that of Venus, the existence of the motions of binary stars, the first revelation of systems besides our own. He threw new light on the Milky Way and the constitution of nebulae, and, in fact, was the first to give the human mind any conception of the immensity of the universe. His catalogue of double stars, nebulae, &c., and tables of the comparative brightness of stars, and his researches in regard to light and heat, would of themselves entitle him to the first rank as an astronomer and natural philosopher. For a notice of H.'s telescope, see TELESCOPES. He erected one monster telescope, as it was then considered, of 40 feet length. It was begun 1785, and finished 1787, on the 28th August of which year he by means of it detected the sixth satellite of Saturn.

HERSCHEL, CAROLINE LUCRETIA, sister of the astronomer, Sir William Herschel (q.v.), born March 1750, lived in Hanover till 1772, when she came to England to live with her brother at Bath. When William turned astronomer, she became his constant helper; and on his being appointed private astronomer to George III., she acted as his assistant, doing all the duties of an assistant astronomer, and in that character receiving a small salary from the king. While discharging her duties in this position, she found time for a series of independent observations with a small Newtonian telescope, made for her by her brother. Her special business was to sweep the heavens for comets, seven of which she discovered, in regard to five of which she has the credit of priority of discovery; and several remarkable nebulae and clusters of stars included in William's catalogues were described from her original observations. In 1798, she published, with an introduction by her brother, *A Catalogue of Stars taken from Mr Flamsteed's Observations, &c.* This valuable work was published at the

expense of the Royal Society, and contained 561 stars omitted in the British catalogue. She lived with her brother during the whole of his career, sharing his labours and distinctions, and on his death returned to her native country. She was then 72 years of age, but she lived to be 98, retaining all her faculties to the last. In her last days, she was not idle. In 1828, the Royal Society conferred on her their gold medal for completing the catalogue of nebulae and clusters of stars observed by her brother. She was afterwards chosen an honorary member of the Royal Society. Miss H. died in 1848, after an uncommonly long life, distinguished by most useful scientific labours.

HERSCHEL, SIR JOHN FREDERICK WILLIAM, BART., only son of the astronomer, William Herschel (q.v.), born at Slough, 1790, educated at St John's, Cambridge, where, in 1813, he became senior wrangler and first Smith's prize man. His first publication was *A Collection of Examples of the Application of the Calculus of Finite Differences* (1820). In 1822, he applied himself especially to astronomy, using his father's methods and instruments in observing the heavens. For a time, he worked with Sir James South in re-examining the nebulae and clusters of stars described in his father's catalogues. The results of the re-examination were given in 1833 to the Royal Society in the form of a catalogue of stars in order of their right ascension. The catalogue contained observations on 525 nebulae and clusters of stars not noticed by his father, and on a great number of double stars—in all between 3000 and 4000. This important contribution to science led to his being acknowledged as the worthy successor of his father; so early, indeed, as 1826, the Royal Society had voted to him and South a gold medal apiece for their observations on double stars; but by 1833 his pre-eminence was beyond the necessity of being marked by acknowledgments. His 'Treatise on Sound' had appeared in the *Encyc. Metro.* in 1830, and his 'Treatise on the Theory of Light' (in the same work) in 1831, in which year also appeared in Lardner's *Cyclo.* his well-known 'Preliminary Discourse on the Study of Natural Philosophy'—not to mention his papers in the *Trans. Astron. Soc.* The Preliminary Discourse—one of the most charmingly written books on science in any language—contributed largely to his popularity. In 1836, appeared his 'Treatise on Astronomy' in Lardner's *Cyclo.* At this time, H. was at the Cape of Good Hope, where he arrived in January 1834, with the intention of completing the survey of the sidereal heavens, by examining the southern hemisphere as he had done the northern. Here he established his observatory at a place called Feldhausen, six miles from Table Bay. On the 5th March 1834, he commenced his observations; and in four years, working all the time at his own expense, he completed them. The public interest taken in his labours was, as might be supposed, very great; but though now and then gratified by partial statements of his results, it was not till 1847, nine years after his return from the Cape, that it received full gratification in the publication of a volume of *Results of Astronomical Observations made during 1834—1838 at the Cape of Good Hope; being the Completion of a Telescopic Survey of the whole Surface of the Visible Heavens commenced in 1825.* It need not be said that the results of these labours are invaluable. They are now incorporated into all books on astronomy. H., when at the Cape, gave an impulse to the science of meteorology, having the merit of having suggested the scheme for taking meteorological observations simultaneously at different places. In 1844, he published, under official military authority, a book of instructions for

taking and recording such observations in Southern Africa.

On his return to England in 1838, honours were showered on him. He had got the Royal Society's gold medal in 1836; he now was made a D.C.L. of Oxford; on Queen Victoria's coronation, he was created a baronet; he now succeeded the Duke of Sussex as President of the Royal Society; in 1848, he became President of the Royal Astronomical Society. In 1849, he published his *Outlines of Astronomy*, an enlargement of the publication in Lardner's *Cyclo*. In 1850, he was appointed Master of the Mint. This office, on account of ill health, he resigned in 1855. (The distinguished astronomer and mathematician died 11th May 1871.)

HERSE, or HEARSE (Fr. *herse*, a harrow; hence a frame for setting candles in), had originally quite a different meaning from that in which it is now used. The term was applied to a bar or framework with upright spikes for the reception of candles, and was used at the ceremonies of the church and at funeral services. It was originally very simple in form, but in the 15th and 16th centuries herse of great splendour came into use, and were erected in the churches over the bodies of distinguished personages. The framework was of iron or brass, sometimes of beautiful workmanship, square, octagonal, &c., in plan, with pillars at the angles, and arched framework above forming a canopy. The whole was hung over with rich cloths and embroidery, and lighted up with hundreds of wax candles, and decorated with wax images. From this the transition to the modern funeral hearse (see FUNERAL RITES) can be easily traced. In Catholic churches of the present day, the hearse still exists as a triangle with spikes, on which candles are placed.

Herse.

HERSFELD, an old town of Hesse-Cassel, in the province of Fulda, situated on the left bank of the river Fulda, which here becomes navigable, 32 miles south-south-east from the city of Cassel. The cathedral, built in the beginning of the 12th c., on the site of an older cathedral that had been destroyed by fire, was itself set fire to by the French in 1761. Its remains form a picturesque ruin. Pop. 7000, who carry on extensive manufactures of woollen cloth and serge.

HERSHIP, an old Scotch law term, denoting the offence of carrying off cattle by force.

HERTFORD, a parliamentary and municipal borough, market-town, and capital of the county of the same name, is situated on the Lea, 26 miles north of London by rail. It contains few buildings of any architectural importance, but there is a branch of Christ's Hospital, a grammar-school, and several charity schools. H. carries on no manufactures; there are, however, linseed-cake mills and several malting and corn-mills in the town and vicinity. There are here a fairly attended corn-market on Saturdays, and three annual fairs. The town returns two members to parliament. Pop. (1861) 6769. (1871—7896.)

The old castle of H. (scarcely a fragment of which now remains) was built about 905. It was

strengthened and repaired about the Conquest. The present castle is of the time of James I.; and in the early part of the century, it was used as a college for the students of the East India Company's civil service. It now belongs to the Marquis of Salisbury, and is a private residence.

HERTFORDSHIRE, or HERTS, an inland county of England, is bounded on the E. by Essex, on the S. by Middlesex, on the W. by Buckingham and Bedford, and on the N. by Cambridge. Area, 391,141; pop. (1861), 173,294. The surface presents a pleasing succession of finely wooded hill and fertile valley. The chief elevations are those of the chalk downs, a branch of the Chiltern Hills, which skirt the north of the county. The principal rivers are the Lea and the Colne, both affluents of the Thames. Chalk, at a greater or less depth below the surface, forms the basis of the soil, which is various, much of it being, however, a mixture of gravel and loam, with a tract of rich loam on the borders of Essex. Climate, mild and healthy. The agriculture of the county has improved very much of late years. Immense quantities of hay and straw are sold off the land, and sent to London. Throughout the county there are numerous gardens and orchards, the fruit of which is sent to the London market. Great quantities of malt are made in the county: Ware is the chief seat of the malting trade in the kingdom. Paper and straw-plait are extensively manufactured in the west and south. Three members are returned for the county. (1871—pop. 192,725.)

HERTOGENBOSCH, or HERZOGENBOSCH. See BOIS-LE-DUC.

HERTZ, HENRIK, one of the most distinguished living Danish poets, was born in Copenhagen in 1798, of Jewish parents. In 1832, he abjured Judaism, and joined the Protestant Church. His first appearance as an author was in 1827, when he produced several clever vaudevilles and comedies, as *Kjerlighed og Polit, Hr Burchardt og hans Familie, Flyttedagen*, &c.; while three years later, appeared his *Gjengangerbreve eller poetiske Epistler fra Paradis*, which exhibited such wonderful powers of imitating the style and spirit of other writers, more especially those of his countryman Baggesen, that public attention was at once arrested. Hitherto, he had written anonymously, but the masterly manner in which he had stigmatised the affectations and puerilities which had perverted the literature and criticism of the Danish press, produced a perfect ferment in the literary circles of Copenhagen, which led before long to the discovery of the unknown writer. From this time his works followed one another in rapid succession; and striking out in an entirely different path from the one on which he had first entered, he produced, in 1837, a dramatic poem, *Iven Dyrings Hus*, founded on an old heroic saga, which, in the opinion of his countrymen, constitutes his masterpiece; among Germans, however, his lyrical drama of *Kong René's Datter* (1854) is the best known and most popular of his numerous works.

HERZEGOVINA is the name of a province belonging to European Turkey, and situated between Croatia, Bosnia Proper, Montenegro, and Dalmatia. Under the Venetians, the H. was called the Dukedom of St Saba; at a later period, it went under the name of the county of Chulm; and in 1326, was again raised to the rank of a dukedom by the Emperor Frederic III. As early as 1466, the H. fell into the hands of the Turks, remaining for more than two centuries afterwards the battle-field between Christians and Mohammedans. By the treaty of Carlowitz (1697), the H. was definitively annexed to the Turkish empire, with the exception of the town Castelnovo

and its outskirts, which up to this day belong to Austria. In the early history of Hungary, the H. plays a prominent part, as Bosnia and Bulgaria were for a considerable period under the sway of the Hungarian crown. According to the present organisation of European Turkey, the H. bears the name of the Sanjak Hersek, and belongs to the Eyalet of Bosnia. Its physical aspect, as also its political and ethnographical character, coincide with those of Bosnia (q. v.).

HERZEN, ALEXANDER, a Russian author, was born at Moscow in 1816. Before he had concluded his university studies, he was seized, along with some of his fellow-students, on the pretext of maintaining sentiments hostile to the government; and after an imprisonment of about ten months, he was banished, in 1835, to Perm, not far from Siberia, and subsequently to Viatka and Novgorod. After 1842, he was permitted to reside at Moscow, under the strict surveillance of the police, and for some years devoted himself exclusively to literary labours. In 1847, he left Russia, to visit other parts of Europe, and since 1852, has resided in London. In his own country, H.'s life was one long petty persecution. He was despoiled of his property, his works were subjected to the most rigid censorship; and during his travels, he discovered, to his extreme disgust, that he was 'attended' by Russian spies. H.'s literary performances are *Dilettantism in Science* (1842), *Letters on the Study of Nature* (1845—1846), *Whose Fault is it?* and *Doctor Kroupof* (both in 1847), *Recollections of My Travels* (1848), *From the Other Shore*, and *Letters from France and Italy* (1850). Since his residence in London, H. has published a variety of important works, among which may be mentioned, *On the Development of Revolutionary Ideas in Russia* (1851), *Baptized Property* (1853), or 'Serfism,' *Prison and Exile* (1854), *My Exile* (1855), *Interrupted Tales* (1856), *France or England* (1858), a pamphlet warning Russia against an alliance with Napoleon, and *Memoirs of Catherine II.* (1859).

HE'SIOD, next to Homer the earliest Greek poet of whom we have any knowledge, was born probably in the 8th c. B.C., at Asera, in Boeotia, whither his father had emigrated from the Æolian Kyme, in Asia Minor. He seems to have been at first a peasant or herdsman in quite humble circumstances—in his *Works and Days*, he speaks of himself as *atimētos*, 'unhonoured,' 'noteless.' He afterwards left Asera, and went north to Orchomenos, on Lake Copais, where he dwelt during the remainder of his life, and where in later times his tomb was shewn. This is really all we know about H., for the marvellous stories of the Neo-Platonists afford us no intelligible clue to his personal history; and in the opinion of some critics, even throw grave doubts on his historical reality altogether. This, however, is probably too extreme a view. But while it may not be necessary to reject the personality of H., it may still be allowed that he was a 'representative man,' the founder and head of a school of poets—the Boeotian or Pierian—who stand in striking contrast with the older Ionic or Homeric school. Their original region was at the foot of Mount Helicon, whence they spread over Boeotia, Phocis, and Eubœa. Their language and versification were nearly the same as those of the Homeric school, but in all other respects they appear to have been different, and even antagonistic, ignoring the sanguinary struggles of the heroic age, and preferring to sing of rural quietude and peaceful pursuits, the simple sanctities of household life, the homely duties of thrift, the education of children, and the prosaic

details of commerce and politics. Hence the Spartan, Cleomenes, scornfully termed H. the 'poet of helots,' while Homer was the poet of warriors. In fine, it may be said that the poetry of the Hesiodic school indicates an advance in civilisation, morality, and thought, on the Homeric school.—The works either written by or ascribed to H. are seven in number, of which the following are the more important: 1. *Erge kai Hemera* ('Works and Days'), in the time of Pausanias, the only one considered to be truly H.'s by the people about Mount Helicon; 2. *Theogonia* ('Generation of the Gods'), not considered genuine by H.'s countrymen, nor by most modern critics; 3. *Eoiai* or *Eoiai Megalai*, called also *Katalogoi Gunaiôn* ('Catalogues of Women'). Of these the first two are entire; while the well-known *Aspis Herakleos* ('Shield of Hercules') is supposed by some to be a relic of the third. The Hesiodic poetry was, in ancient times, if not warmly admired, at least held in great veneration. Both the priesthood and the philosophers considered the *Theogony* a great, in fact, the greatest authority, on the subjects of which it discourses, and almost all the great Alexandrine critics earnestly devoted themselves to its elucidation, but their commentaries have unhappily perished. Only here and there among the *Scholia* of the later Neo-Platonists some of their remarks are preserved. The most complete collection of these is to be found in Gaisford's *Poete Græci Minores*. The first edition of the Hesiodic poems appeared at Milan in 1493; subsequent editions are those of Heinsius (Amsterdam, 1667), of Robinson (Oxford, 1737), of Loesner (Leips. 1778), of Gaisford (vol. i. of his *Poet. Gr. Min.*), and of Götting (Gotha and Erfurt, 1831; 2d ed. 1843).

HESPERIDES, the name of the famous sisters who, assisted by the dragon Ladon, guarded the golden apples which Hera had received, on her marriage with Zeus, from Ge. Their genealogy, as well as their number, are variously given by mythologists. The locality of the gardens was also a matter of controversy, the two favourite opinions placing them westward of Mount Atlas, and north of the Caucasus. The apples were stolen by Hercules (q. v.), but were afterwards restored by Athena.

HESSE (Ger. *Hessen*), a territory of Germany, occupied, in ancient times, by the *Catti* or *Chatti*, who first became known to the Romans in the year 15 A.D., when Germanicus destroyed their principal settlement of Mattium, the site of the present villages of Gross and Klein Maden, near Gudensberg. In the course of time, the Catti, who were settled in the districts now known as Upper and Lower Hesse, gradually merged in the Frankish tribes, with whom they took part in the great emigration into Belgium and Gaul, after which the territories which they had evacuated were occupied by Saxons, who thenceforward took possession of the land known in after-ages as Saxon Hesse. The power of the chiefs had, in the meanwhile, become so firmly established under the Frankish empire, that on the fall of the Carolingians, in 911, Conrad I., Duke of Franconia and Hesse, was elected to the vacant throne of Germany, as being the most powerful of the princes of the empire. The various branches of the Hessian family still extant are descended from Heinrich I., surnamed the Child (died 1306), son of Sophie Duchess of Brabant. Although he himself exercised little real power, owing to the dismemberment of H. into numerous semi-independent principalities, his descendants gradually reunited these disjointed domains, and added many valuable territories on the Rhine to

their old patrimony. Philip I., the Magnanimous, who succeeded his father, Wilhelm II., as a minor, in 1509, introduced the Reformation into H., and founded the university of Marburg, with the revenues of the secularised convents and monasteries. This prince took an active part in the peasant and religious civil wars of his day; and by a will made in 1562, divided his territories among his four sons, who succeeded to their allotted possessions on his death in 1567. The eldest, Wilhelm IV., obtained the half of the Hessian domains, with Cassel for his residence; Ludwig, a fourth part, with Marburg; Philip, an eighth part, with Rheinfels; and George, an eighth part, with Darmstadt. The death of Philip and Ludwig left all the Hessian dominions in the two main lines of Hesse-Cassel and Hesse-Darmstadt (q. v.).

HESSE-CASSEL (Ger. Hessen-Kassel, *Kurhessen*, or Electoral Hesse) consists of one large and five smaller districts—the former extending in an irregular form from 50° 3' to 51° 40' N. lat., and from 8° 36' to 10° 12' E. long.; while the latter, which comprise the countship of Schaumburg and Schmalkald, a part of Henneberg and Barchfeld, and various townships, are impacted within the territories of other states. H.-C. is bounded by Prussian Westphalia, Waldeck, Hesse-Darmstadt, Nassau, Frankfurt-on-the-Maine, Lower Franconia, Prussian Saxony, and the principality of Göttingen. It is divided into the following provinces or circles:

Provinces.	Area in Sq. Miles.	Population at the close of 1855.	Chief Towns.	Pop.
Lower Hesse and Schaumburg, }	1690.5	350,648	Cassel, the capital,	32,500
Upper Hesse, .	764.4	118,950	Marburg, .	8,000
Hanau, .	495.6	121,532	Hanau, .	15,000
Fulda & Schmalkald,	697.2	135,506	Fulda, .	14,000

Giving for the whole electoral duchy a square area of 3647.7 miles, and a pop. of 726,686.

Physical Character.—The country is generally hilly, and in some places even mountainous, forming a part of the great central elevated plateau of Germany. The most considerable of the ranges are the Habichtswald, the Thuringerwald, of which the greatest elevation is the Inselberg (2930 feet), the Meissner (2350 feet), the Hundsrück, Kellerwald, and Reinhardwald.

The principal rivers are the Werra, with its numerous small affluents, but which only belongs in part to H.-C.; the Fulda, whose course appertains almost exclusively to this duchy; the Edder; and as boundary rivers, the Weser, Maine, and Lahn.

Climate, Soil, Products.—The climate is generally mild, but in some of the mountainous districts, as the Rhöngebirge, it is at times very severe. The mean annual temperature is 48°-5° Fahrenheit.

The soil is almost unexceptionally fruitful and well adapted to agriculture. Cereals of all kinds yield good returns. The most cultivated districts are in the south-west of Hanau, where much fruit and some good wines are produced. Flax is grown in Schaumburg and Lower Hesse, and tobacco in the valleys of the Werra. It is estimated that for every hundred parts the land is distributed nearly in the following ratio: woods, 40; arable land, 37; meadow land, 11; miscellaneous, 12.

The mineral products comprise copper, lead, cobalt, vitriol, alum, clay, large quantities of iron, coal, and salt, the last three of which are the property of the state. The mountain districts have many good mineral springs, the most important of which are those at Schwalheim, Wilhelmsbad, Hofgeismar, Rodenberg, and Nenndorf.

Industry, Imports, and Exports.—Trade.—In addition to agriculture and the rearing of cattle and other animals, the chief branches of industry are the weaving of linen and yarn, which, although everywhere practised, is prosecuted with most vigour about Fulda and Marburg. There are good steel and iron works at Schmalkald, and manufactories of guns at Cassel, and porcelain, glass, paper, and gold and silver wire-works in Hanau and other parts of the electorate. The exports consist principally of yarn and linens, iron and steel wares, fine clay, wood, leather, grain, dried fruits, and mineral waters. The transit-trade is considerable, and is principally conducted by way of Hanau, Carlshafen, and Eschwege. The internal commerce centres more especially in Cassel and Hanau, where, as well as at Spangenberg and Schmalkald, annual commercial fairs are held. H.-C. has between 900 and 1000 miles of good public roads, and upwards of 200 miles of railway, in addition to which it possesses great facilities for internal trade in its numerous navigable rivers.

Receipts, Expenditure.—According to the budget of 1858—1860, the annual receipts of the electorate are about 5,100,000 thalers, and the expenditure so much less as to leave an annual overplus of about 95,000 thalers. The national debt in 1861 represented a capital of 3,700,000 thalers, but this was exclusive of 8½ million thalers raised for the construction of railways, and 1½ million thalers extraordinary loans.

Army.—The army, since 1848, has been kept at 12,900 men, of whom 5000 are on the reserve list. Military service is compulsory between the ages of 20 and 30 years.

Education.—There are about 1300 national schools, ten gymnasia, six normal, and various polytechnic, theological, military, and other schools. H.-C. has one university at Marburg, memorable as being the first which was founded (in 1527) after the Reformation and without papal authority.

Religion.—The majority of the population belong to the Reformed or Calvinist faith, which is also the professed creed of the electors, but other creeds present the following numbers: Lutherans, 134,000; United Protestants, 100,000; Catholics, 100,700, half of whom belong to Fulda; Jews, 16,000. All the churches recognised by the state enjoy equal rights.

Law.—The supreme court of appeal is at Cassel, with two high courts of justice at Cassel and Fulda, under whose jurisdiction are various criminal, and 87 magisterial courts.

The electorate of H.-C. has a limited monarchical government. The ruler bears the title of Electoral Prince and Landgraf of Hesse, Grand Duke of Fulda, Prince of Hersfeld, Hanau, Fritzlar, and Isenburg, Count of Katzenellenbogen, Dietz, &c. The dignity, which is hereditary in the male line only, is at present held by the Elector Frederick Wilhelm I. The elector is assisted in the government by a council of ministers, who are partially responsible. A new constitution, based on the federal decision of 1857, was promulgated in 1860. There are two representative chambers, the higher of which comprises the princes of the electoral family, several *Mediatized Princes* (q. v.), officers of state, and large landed noble proprietors; while the lower chamber comprises 48 members, one-third of whom represent the landed proprietors, and the remainder the civic and rural districts. The chambers must be convoked at least once in every three years. Each parish is presided over by a burgher-master (*Bürgermeister*) or magistrate, each circle by a government official, and each province by a special governor.

H.-C. occupies the eighth place in the German Confederation. It has three votes in the *Plenum* or general council of the diet, and supplies a contingent of 6626, and a reserve of 2840 men to the federal army.

History.—Hesse-Cassel is the elder line of the House of Hesse, founded by Landgraf Wilhelm IV., or the Wise, son of Philip the Magnanimous, who reigned from 1567 to 1592, and held his court at Cassel. Wilhelm was succeeded by his son Maurice, who joined the Protestant Church, and five years before his death resigned the government in 1627 to his son Wilhelm V. The latter fought on the side of Sweden during the Thirty Years' War, for which he was put under the ban of the empire. His two brothers, Hermann and Ernest, respectively founded the lines of Hesse-Rotenburg and Hesse-Rheinfels; and on his death in 1637, his widow assumed the regency for their young son, Wilhelm VI., and by her ability, secured for him, as an indemnification for the losses which the country had sustained during the war, the greater part of Schaumburg and the principality of Hersfeld. The successors of Wilhelm V. pursued the practice he had begun of hiring out Hessian soldiers to fight in the service of foreign princes, a practice by which the finances of the state were considerably augmented at the expense of the welfare and morality of the people; while, in some instances, it led to the formation of important alliances on the part of the reigning House. The landgraf, Friedrich I., who succeeded his father in 1730, had become king of Sweden in 1720, in right of his wife, the Princess Ulrike Eleanor, sister of Charles XII. His brother, Wilhelm VIII., to whom he had resigned his Hessian territories, fought under the British and Hanoverian flag in the Seven Years' War, and gained considerable renown for himself and his troops during the course of the war, which was especially disastrous to the welfare of his states. Wilhelm's son, Friedrich II., persevered in the same course, and kept up a splendid court on the proceeds of the pay, amounting to £3,000,000, which the British government gave him for the services of the 22,000 Hessians who fought against the Americans in the war of independence. Friedrich, who had become a convert to the Romish Church, died in 1785, and was succeeded by his son, Wilhelm IX., who reigned as Wilhelm I., after his elevation to the rank of an elector in 1803. This prince frequently shifted sides and parties during the French revolutionary and imperial war, fighting with his Hessian mercenaries first under British colours, then in conjunction with Prussia, and in 1806 as the ally of Napoleon, who in return for his aid promised to respect the neutrality of the electorate. After the battle of Jena, the French emperor, suspecting the motives which had actuated the elector in augmenting his army, threw troops into the Hessian territory, and at the peace of Tilsit incorporated the electorate in the newly formed kingdom of Westphalia. In 1813, Wilhelm returned to his dominions after the overthrow of French power in Germany, and at once began to restore the old order of things as far as he could; while he entered upon a course of vexatious litigation to recover the state lands that had been sold during his exile, and appealed to the diet with such importunate pertinacity for indemnification, that he obtained various important concessions at the congress of Vienna, although he failed in his wish to secure the title of king, of which he was especially ambitious. In accordance with the promise which he had made his subjects on his restoration to power, he summoned a body of jurists to construct a constitution; but no sooner was a draft of this new scheme completed, than he

refused to fulfil his promises. His death in 1821 was regarded as a fortunate event for the electorate; but his son and successor, Wilhelm II., by his narrow policy, increased the rapidly growing disorders of the state, while his relations to his mistress, the obnoxious Countess of Reichenbach, rendered him peculiarly unpopular with his subjects. These disorders were partially arrested by the retirement of the elector in 1831, and the nomination of the electoral prince to the rank of regent. But the history of the 16 years' regency of Prince Friedrich Wilhelm exhibits only a series of intrigues at court, dissensions between the government and the representatives of the people, and a retrogressive policy, which left H. far behind other German states in material prosperity. The death of the old elector at Frankfurt, whither he had retired on his abdication, raised the regent in 1847 to the rank of sovereign elector. The revolution of Paris, in 1848, extorted from the terrified prince many liberal promises of reform, some of which were redeemed; but in 1850, after revoking many of his pledges, he summoned the obnoxious Hassenpflug and Haynau to govern the country. Hassenpflug's measures at length drew upon him a public charge of maladministration and treason; and he having persuaded the elector that his personal safety would be endangered if he remained longer among his subjects, the prince and his minister fled by night from Cassel to Wilhelmsbad. On the 17th September 1850, an ordinance proclaimed that the seat of government had been transferred to the latter place. Hassenpflug appealed to the Confederation for its intervention, and H. became the rendezvous of troops; the Austrian and Bavarian contingents occupying the south, and the Prussians, apparently for the protection of the people against the elector, taking their position in the north. The threatened war was principally limited to angry protocols, but the result of the intervention was the restoration of the elector, who returned to Cassel. In 1852, a new constitution was promulgated, which in no way satisfied the people, whose conduct throughout the trying crisis had been marked by forbearance and moderation. The policy of the government remained unchanged notwithstanding all that had occurred; arrests were frequent, and many of the best of the civil and military officials tendered their resignation, rather than continue in the service of the elector. Various constitutions have since then been proposed to and rejected by the Chambers. (Hesse-Cassel is now incorporated with Prussia. See GERMANY, in SUPPLEMENT.)

HESSÉ-DARMSTADT, a grand duchy of Germany, extending (exclusive of small outlying portions) between 49° 24' and 51° 7' N. lat., and 7° 50' and 9° 40' E. long., consists of two nearly equal parts, which are separated by a strip of land belonging to Hesse-Cassel and Frankfurt-on-the-Maine. The northern district, which is bounded by Hesse-Cassel, Nassau, and Prussia, is mountainous, being intersected by the Vogelsberg, and branches of the Taunus and Westerfeld; while the southern district, which is bounded by Hesse-Cassel, Bavaria, Baden, Prussia, and Nassau, is level, except in the east, which is occupied by the mountain-range of the Odenwald. H.-D. is divided into the following provinces:

Provinces.	Area in Sq. Miles.	Pop. in 1858.	Chief Towns.	Pop.
Upper Hesse,	1530.9	300,261	Giessen,	10,000
Starkenbourg,	1150.8	318,422	{ Darmstadt, }	34,000
Rhenish Hesse,	525.	226,888	{ the capital, }	44,000
			Mainz,	

Giving an area of 3206·7 square miles, and a population of 845,571 for the entire duchy.

Physical Character.—H.-D., which presents a succession of fruitful valleys and rich mountain slopes, is well watered, being traversed by the Rhine and Maine, Neckar, Nahe, Lahn, Nidda, Edder, Nidder, and Wetter.—The climate of the northern districts of H.-D. is very much more severe than that of the southern or Starkenburg district, which shares the climate of South Germany.

Agriculture is in a very flourishing condition, nearly half of the soil being occupied by arable lands. Corn is grown in sufficient quantity for exportation, chiefly in Upper Hesse, where Indian corn, or maize, and flax are also largely cultivated, while hemp, tobacco, and poppies are raised in Rhenish Hesse. The southern districts, in which a great variety of fruit is grown, including figs, almonds, chestnuts, &c., are specially noted for the excellence of their wines, the choicest of which are the Niersteiner, Laubenheimer, Bodenheimer, and red Ingelheimer, grown in the vicinity of Mainz, the Scharlachberger near Bingen, and the Liebfrauenmilch in the districts around Worms.

The mineral products, which are inconsiderable, include copper, cobalt, iron, salt, and coal, the three latter of which are most abundant in the Wetterau districts.

Industry.—The principal branches of industry are, besides agriculture, the making of wine, which in good years yields a return of upwards of four million thalers; the manufacture of cottons, linens, and stockings; and the weaving of straw in Upper Hesse; the preparation of oils and leather; and the manufacture of paper, snuff, papier-mâché goods, &c. H.-D. has 1100 miles of post-roads, and about 120 miles of railway; while the steam-navigation of the Rhine, Maine, and Neckar affords still more extensive means of communication, which, however, are partly or wholly closed during the winter months.

Revenue.—The budget for the years 1860—1862 gives the following estimate of the financial condition of the grand duchy: annual receipts, 9,096,664 florins; annual expenditure, 9,066,796 florins, leaving a surplus of 29,868 florins. The public debt, exclusive of the loans made for the construction of railways, amounted in 1860 to 6,470,000 florins.

Army.—The army comprises in all 10,618 men, the term of service is for six years, the latter two of which include the reserve service. There is a military college at Darmstadt.

Education.—In 1852, there were 1756 national schools, 9 normal, and 1 higher burgher school, while the educational wants of the higher classes are well supplied by the university of Giessen (q. v.), with its noble library, and the 24 scientific institutions connected with it; by 6 gymnasia, and by polytechnic, military, and theological schools. The chief towns support various scientific and literary societies, and the duchy generally is favourably distinguished in respect to the diffusion of knowledge.

Religion.—In regard to religion, the population may be divided as follows: Lutherans, 400,000; Reformed Calvinists, 29,000; Catholics, 218,000; Unitarians, 165,000; Jews, 29,000; various sects, 3900. The Lutherans have a consistory at Darmstadt, with three minor courts under its jurisdiction, while the Roman Catholic churches are under the supervision of a bishop, who has his see at Mainz.

Law.—There is a supreme tribunal of law at Darmstadt, with lesser courts at Darmstadt, Giessen, and Mainz, and numerous local courts in the country districts, in some of which trial by jury prevails.

Political Constitution, &c.—H.-D. supplies a

contingent of 7227 men, with a reserve of 3098 to the federal army, occupies the ninth place in the German Confederation (q. v.), and has three votes in the *Plenum* or full council, and one vote in the limited council. It is a limited monarchical state. Its ruler, who must be a Lutheran, bears the title of Royal Highness, and ranks as Grand Duke of Hesse, and as a Rhenish grand duke. The succession is hereditary in the female line in default of male issue. In accordance with the law of 1856, there are two legislative chambers of representatives, which must be convoked at least once in every three years, but the real power of the government rests with the council of state and the five ministries, into which the several branches of the administration are divided.

History.—The line of H.-D., the second main branch of the House, is derived from the Hessian count, George I., who, on the death of his father, Philip the Magnanimous, in 1567, obtained the upper countship of Katzenellenbogen, with the town of Darmstadt for his residence; and succeeded in 1583, on the death of his brother without heirs, to a third of the patrimony of the latter. He was succeeded in 1596 by his eldest son, Ludwig V., while his third son, Frederick, became the founder of the Hesse-Homburg line (q. v.). Ludwig V., who acquired a portion of Upper Hesse, was the founder of the university of Giessen. Although H.-D., like every other part of Germany, suffered considerably during the French revolutionary wars, it finally acquired a great addition to its territories through the agency of Napoleon. Ludwig X., who had succeeded his father as landgraf in 1790, joined the Confederation of the Rhine, and after having acted against Austria in 1809, and in concert with the French in 1813, offered, after the battle of Leipzig, to act with the allies against France, on condition of being allowed to retain his various acquisitions of territory. He had assumed the title of grand duke in 1806, and on that occasion he promulgated various legislative edicts, and annulled the pre-existing union of the H.-D. and the Hesse-Cassel diets. In 1814, he joined the German Confederation, and made large cessions of territory to Prussia, Bavaria, and Hesse-Cassel, receiving by way of indemnification a portion of the French department of Donnersberg, or Mainz, extending to the Lahn, and the greater part of the principality of Isenberg, in right of which he assumed the additional title of a Rhenish grand duke. In accordance with the decree of the federal diet, Ludwig gave his subjects a representative form of government in 1820, the scheme of which was, however, so obnoxious to the assembled states, that the grand duke and his advisers were compelled to withdraw it, and to substitute another in its place. The task of framing this constitution occupied several diets in succession, and gave rise to much angry discussion within and without the chambers. The death, in 1830, of the grand duke, who from various causes was endeared to his subjects, widened these differences, and angry discussions soon arose in regard to the civil list to be accorded to the new grand duke, Ludwig II. In the course of the next few years, one diet after another was convoked and prorogued, but no material change was effected in the relative position of the chambers and the government. The death of the grand duke, Ludwig II., in 1848, and the accession of his son and co-regent, Ludwig III., the present grand duke, brought little change for the better. In the meantime it must, however, be admitted that, notwithstanding frequent dissensions in church and state, the duchy made considerable advances in material prosperity; railways were opened, and new roads formed;

monopolies and other commercial restrictions removed; greater freedom permitted in the curriculum of the university, and a more liberal spirit infused into the system of the education imparted in the national schools. Although these and many other improvements were grudgingly yielded, they have been permanent, but the character of the grand ducal policy has neither been liberal nor in accordance with the wishes and views of the majority of the people. See GERMANY in SUPP.

HESSIE-HOMBURG, a German landgraviate, consists of the provinces of Homburg and Meissenheim; the former of which is bounded by Hesse-Darmstadt, Hesse-Cassel, and Nassau, and the latter by Rhenish Prussia and the Bavarian palatinate.

Provinces.	Area in Sq. Miles.	Pop.	Chief Towns.	Pop.
Homburg, .	32.90	12,117	Homburg, .	5000
Meissenheim,	73.03	13,629	Meissenheim,	2600

Giving 105.98 square miles for the superficial area, and 25,746 for the population of the entire landgraviate.

The former of these provinces is a fruitful district lying on the slopes of the Taunus Mountains, which produces grain, wine, and timber; while the latter is mountainous, and yields large quantities of coal and iron, and some excellent wine.

Receipts, &c.—The budget for 1860—1861 gives the following amounts: viz., receipts, 409,946 florins; expenditure, 375,506 florins, leaving a surplus of 34,440 florins. The debt was, in 1861, 1,020,861 florins.

The troops of the landgraviate are 333 men, including a reserve of 100, which comprise the contingent of H.-H. to the federal army. H.-H. is represented by Hesse-Darmstadt in the limited council of the diet, but it holds one independent vote in the *Plenum* or full council. The established religion is Protestant, to which 19,600 of the inhabitants belong, the great majority of whom are attached to the *Reformirte Kirche*, while there are 4100 Catholics, and about 1000 Jews. H.-H. has a legislative representative chamber, and the government is divided into the three departments of Justice, the Interior, and Finances.

The landgraviate was an integral part of Hesse-Darmstadt (to which it will revert on the failure of the direct line), till it was transferred, on the death of the landgraf, in 1596, to his younger son, Friedrich I., in whose family it has since remained as an independent state. Little change was effected in the province till the congress of Vienna, when it was augmented by the addition of Meissenberg. In 1817, H.-H. was admitted into the German Confederation. In 1830, disturbances broke out in Meissenheim; but although they were soon quelled, in consequence of the powers accorded to the landgraf by the diet, several severe edicts were published in 1832 against the liberals, which excited considerable disaffection. The opening of the springs and baths at Homburg in 1833 proved an unexpected source of wealth to the state, and since the addition of gambling saloons, the establishment has constituted a very important branch of the revenue. Attempts have more than once been made by the diet to put down the gambling-tables; but whenever the pressure of federal intervention has been removed, gambling has been resumed with fresh spirit; it is understood, however, that the landgraf has pledged himself to the final closing of the gambling saloons after a limited term. Since their first opening, play has, with only temporary abatement, been prosecuted at all hours and seasons by all ranks, from peasants to princes and

princesses, and almost at all ages, excepting among the subjects of H.-H., who are stringently forbidden to participate in it.

In 1835, H.-H. joined the Zollverein (q. v.). The reigning landgraf, Ferdinand Heinrich Friedrich, who succeeded his brother, Philip August, in 1848, so far yielded to the wishes of his subjects for a constitutional government, as to convoke a diet to deliberate on its nature; but when the scheme of the new constitution was completed, he withdrew his promised consent, and the course of public affairs resumed the old track. See Von Klöden's *Erdkunde*; Stieler's *Atlas*; Ritter; *Almanach de Gotha*, 1862. See GERMANY in SUPPLEMENT.

HESSIAN FLY (*Cecidomyia destructor*; see *CECIDOMYIA*), a dipterous insect, the larva of which has often proved extremely destructive to wheat in North America. Its ravages have occasionally even led to the abandonment of wheat culture for a time in considerable districts. It is black, with dusky wings, darker at the base, pale-brown legs, black feet, and hairy antennæ. There are two broods in the year.

Hessian Fly (*Cecidomyia destructor*).

The maggots of the one brood live at the roots of the plants throughout the winter; those of the other are found in the lower joints of the straw, in the end of spring and beginning of summer.

HE'SYCHASTS (Gr. *Hesychazo*, to be quiet), a mystic and contemplative sect of the Greek church, who renewed in the 14th c. the errors and practices of the older Euchites, and who may be described as the Quietists of the East. There is reason to believe that the principles of the ancient mystics never entirely died out among the Oriental monastic bodies; but they attracted an unusual share of public attention not only at home, but in the western church in the earlier half of the 14th century. A Basilian monk, named Barlaam, a native of Calabria, the ancient Magna Græcia, and himself of Greek origin, in the course of a visit to the monasteries of Greece, observed among the monks several practices and doctrines which he considered grievously reprehensible; and was particularly struck by the doctrinal abuses of the monks of Mount Athos, the 'holy mountain,' the great stronghold of monasticism in Greece. In common with the mystics of all times, these monks placed all perfection in contemplation, and in the elevation and abstraction of soul which contemplation produces. But among many practices which he considered objectionable, there was one which especially provoked his reprobation, and, indeed, his ridicule. Believing that in the soul lay hidden a certain divine light, which it was the office of contemplation to evoke, they withdrew at stated times to a retired place, seated themselves on the earth, and fixed their eyes steadfastly on the centre of the stomach (whence the sobriquet by which they were known, *omphalopsychoi*, navel-souls); and they averred that, after the allotted time of contemplation, a kind of heavenly light beamed forth upon them from the soul (whose seat, they held, was in that region), and filled them with ecstasy and supernatural delight. They declared that this light was the glory of God himself, and they connected it in some unexplained way with the light which appeared at the transfiguration of our Lord upon Tabor. Barlaam denounced these notions as fanatical and superstitious. On the other hand, they were explained and warmly defended by Gregory Palamas,

the Archbishop of Thessalonica; and in order to settle the controversy, a council was held in Constantinople in 1341, which terminated in the triumph of Palamas and the monks. The controversy afterwards turned upon a point of doctrine—namely, on the nature of the so-called divine light supposed to emanate from the soul in this state of contemplation. Other councils were called, one of which, in 1351, again pronounced in favour of the monks, through the influence, it was said, of the court and of the celebrated John Cantacuzenus, who was an ardent patron of the Hesychasts. But the public voice was hostile to the sect, and on the retirement of their patron Cantacuzenus, who, in 1355, became a monk, they fell into obscurity. The controversy about the 'Thaboritic Light,' however, is still discussed in Greek theology. See Mosheim, ii. 659; also Fabricius, *Bib. Græc.* v. 247, 454; Rubenberg, *De Hesychastis Exercitatio*, p. 378.

HESYCHIUS, a Greek grammarian of Alexandria, flourished, according to some authorities, towards the end of the 4th century. He was the author of a Greek lexicon, taken partly from earlier works of a similar character, with the addition of new words and examples from the writings of poets, orators, historians, and physicians. Its value is very great, as it supplies us with extensive information concerning the Greek language and literature, especially of an antiquarian kind. The first edition is that published at Venice in 1514; the best is by Alberti and Ruhnken (2 vols. Leyden, 1746—1766), to which additions were made by Schow (Leip. 1792). Compare Ranke, *De Lexici Hesychiani vera Origine et genuina Forma* (Leip. and Quedlinburg, 1831).—Not to be confounded with the foregoing is the historian HESYCHIUS of Miletus, surnamed the 'Illustrious,' who flourished in the beginning of the 6th c., and was the author of the following works: 1. A book on eminent teachers (*Peri tōn en Paidēiū lampsantōn Sophōn*); 2. Another on the city of Constantinople (*Peri tōn Patriōn Kōnstantinoupolēōs*); and 3. A Chronicle or history (*Biblion Historikon*, &c.), commencing with the earliest times, and coming down to the death of Anastasius. It is now lost. See Orellius, *Hesychii Opera* (Leip. 1820).

HETERO CER CAL (Gr. *hetēros*, different, unequal, and *kerkos*, a tail), a term introduced by Agassiz to designate a peculiarity of structure in the tail of some fishes, in which the tail is unsymmetrical with reference to the body of the fish or the vertebral column; the vertebral column being prolonged into the upper of the two lobes of the tail, and a second lobe, more or less distinct, appearing on the under side. The heterocercal

Heterocercal Tail (Sturgeon).

tail is, among recent fishes, characteristic of the Cartilaginous Fishes, and is, therefore, a much less prevalent form than the symmetrical or homocercal (Gr. *homos*, equal) tail. It is very generally regarded as indicating an affinity to Saurian reptiles. But in the older geologic formations, the heterocercal is the prevalent form; in all the formations older than the oolitic it exclusively appears.

HETEROGANGLIATA (Gr. *hetēros*, diverse, and *ganglion*, a ganglion), a term introduced by Owen, and adopted by many zoologists, in accordance with a scheme of zoological classification founded on the nervous system in animals, to designate the *Mollusca* of Cuvier, with which are ranked the 'zoophytes' of the division *Polyzoa* or *Bryozoa*. The nervous centres or ganglia are not arranged in a longitudinal series of symmetrical pairs, but are variously distributed in different parts of the body; one principal ganglionic mass, however, occupying a position above the gullet, with which all the nerves of the special senses which exist are connected. With it, also, all the other ganglia communicate.—Whether or not the new name heterogangliata, may ultimately come into general use among systematic zoologists, it certainly indicates a most important character in the organisation of the animals to which it is applied.

HETMAN, or ATAMAN, the title of the head or general of the Cossacks, now retained only among the Cossacks of the Don. From the earliest times the H. was elected by the voice of the assembled people; the mode of election being by throwing their fur-caps at the candidate they preferred, and the one who had the largest number of caps was declared duly elected. The power of the H. was very great, and extended over life and death. When the Cossacks, in 1654, submitted to the Russians, the H. was permitted to retain his rights as formerly. The Empress Catherine entirely abolished the dignity of H. of the Ukraine, and substituted a government consisting of eight members. The Don Cossacks have, indeed, retained their H., but even he possesses but the shadow of his former power. The last elective H. was Count Platoff, who played a prominent part in the wars with France (1812—1814). After his death, the H. was appointed by the czar, and ultimately the title was made hereditary in the grand duke, the heir to the throne.

HEVE'LIUS (known also as HEVEL or HÜVELKE), JOHANN, one of the most celebrated astronomers of the 17th c., was born at Danzig in 1611, and died in that city in 1687. He belonged to an honourable and wealthy family; and in 1641 he erected an observatory in his own house, and furnished it with large telescopes constructed by himself. He published numerous astronomical works. H. was the first astronomer, with the exception of Gassendi, to observe a transit of Mercury (Gassendi's observation was made in 1631, that of H. in 1661); and it is now generally conceded that he ranks next to Flamsteed amongst the astronomers of his day. Delambre devotes ten pages to the notice of his labours in his *Histoire de l'Astron. Mod.*, and his life has been written by J. H. Wesphal (Königsb. 1820).

HEVE'S, a small town of Hungary, in the county of the same name, is situated in the midst of a productive flax and hemp-growing district, 60 miles east-north-east of Pesth. Pop. 5700.

HEXACHORD, a name given by the ancient Greeks, in their music, to the great sixth. In modern music, hexachord denotes the six diatonic degrees of which Guido formed his scale, better known by the six syllables, Ut, re, mi, fa, sol, la, to which the scale was sung.

HEXAGON (Gr. *hex*, six, and *gōnia*, angle), a figure of six sides and six angles; when the sides and angles are equal, it is called a *regular hexagon*. If a regular hexagon be inscribed in a circle, the radius of the circle is equal in length to each side of it, and by joining the centre with the angular points, six equilateral triangles will be formed. This property of the hexagon furnishes a very simple

method of dividing a circle into six equal parts, and at the same time constructing the hexagon, by merely laying off round the circle lines equal to the radius. Of the three figures which can completely occupy space (the equilateral triangle, square, and hexagon), the hexagon contains the greatest area within a given perimeter, the proportions between the three different figures being nearly as the numbers 4, 5½, 6. It is thus that bees, by making their cells of a hexagonal form, enclose the greatest space with the least expenditure of wax.

HEXAHE'DRON (Gr. *hex*, six, and *hēdra*, base), so called from its having six faces, is one of the five regular solids, according to Plato; but in modern times the term Cube (q. v.) has been used in this signification, and the hexahedron is taken to include all solid figures of six faces.

HEXA'METER (Gr. *hex*, six, and *metron*, a measure), the name applied to the most important form of classical verse. It is the heroic or epic verse of the Greeks and Romans, the grandest examples of which are the *Iliad* and *Odyssey* of Homer, and the *Æneid* of Virgil. It consists, as its name implies, of six feet or measures, the last of which must be a spondee (a measure composed of two long syllables), and the penultimate a dactyl (one long syllable and two short). If the penultimate is also a spondee, the verse is said to be spondaic. The following are examples of the hexameter:

Pollā d'ānāntā, kū, tāntā, pūr'āntū tē | dōchmū | t'ēlthōn.
HOMER.
T'it'yrē | tū pātū lā, rēcū, lāns sūb | tēgmīnē | fāgi.
VIRGIL.

The hexameter has been frequently employed in modern poetry, especially in German and English. The facility with which the first of these languages forms compounds is favourable to its use; and Klopstock, Goethe, and Voss have produced admirable specimens of this kind of verse. It has been doubted whether the English is not too stubborn and intractable for the free-flowing majesty of the hexameter; and at present a slightly acrimonious controversy on the point is being carried on among scholars; although many think that the *Ævangeline* of Longfellow, and to some extent the *Vacation Ramble* of Clough, have definitely settled the question in favour of the practicability of this measure being adopted into English. Our readers may judge from the opening lines of *Ævangeline*:

'This is the | forest prim'eval. The | murmuring | pines
and the | hemlocks
Bearded with moss, and with | garments | green,
indistinct in the | twilight,
Stand like | Druids of | eld, with | voices | sad and
pro | phetic,
Stand like | harpers | hoar with | beards that | rest on
their | bosoms.'

The last two lines shew where English versification is weak—viz., in its spondees, unaccented syllables being compelled to do the duty of accented ones.

HE'XAPLA (Gr. *hexapla*, 'the sixfold'), a celebrated edition of the Septuagint version, compiled by Origen for the purpose of restoring the purity of its text, and bringing it into closer agreement with the original Hebrew. Owing to the multiplication of transcripts of the Greek text, numerous errors had crept in; and in the frequent controversies which arose between the Jews and the Greek or Hellenist (q. v.) Christians, the latter, in appealing to the Greek text, were often mortified by the discovery that it by no means represented faithfully the Hebrew original. In order to meet this evil, Origen undertook to provide a means of at least verifying

the genuine Greek text, as well as of confronting it with the original. With this view, he prepared what is known as his *Tetrapla*, or 'fourfold' version, which he afterwards extended into the Hexapla. The *Tetrapla* contained, in four parallel columns, the Septuagint version, together with those of Aquila, Symmachus, and Theodotion. The Hexapla contained, in addition, the Hebrew text, together with a transcript of that text in Greek characters. In some parts of the Old Testament there were superadded one, two, and even three other versions; so that in some parts the work contains nine columns, whence it is occasionally designated the *Henneapla*, or 'ninefold.' Of the origin of these latter versions but little is known.

The Hexapla, however, was something more than a mere compilation of these versions. In the margin were given notes chiefly explanatory, as, for instance, of the Hebrew names. But a still more important characteristic of the work were its restorations and corrections of the original, in which Origen was guided chiefly by the version of Theodotion. This, however, he did not effect by arbitrary alterations of the received text; but, while he retained the common text, by indicating with the help of certain signs (an asterisk for an addition; an obelisk for a retrenchment) the corrections which he sought to introduce. Both these texts, the common (*koinē ekdosis*) and that of the Hexapla, are found combined in existing MSS. The Hexapla, as a whole, has long been lost; several editions of those fragments of it which it has been possible to recover have been printed; by far the most complete of which is that of the celebrated Benedictine, Montfaucon (2 vols. fol. Paris, 1714), which retains, so far as it was preserved in the MSS., the arrangement and even the asterisks and obelisks of Origen. For a more detailed account, see the preface and *Preliminaria* of this learned work.

HE'XHAM, a small market-town of England, in the county of Northumberland, is agreeably situated on the right bank of the Tyne, 20 miles west of Newcastle. The Tyne is here crossed by a bridge of nine arches. The priory church, an old cruciform structure of the 12th c., is now used as the parish church. It has a lofty central tower, and at its western end are remains of the magnificent monastery erected in the 7th c. by St Wilfrid. The chief manufactures of the town are gloves and hats. Pop. (1861) 5270.

HEYLIN, DR PETER, an English divine, of considerable note in his own day, was descended from an ancient Welsh family belonging to Montgomeryshire, and was born at Burford, in Oxfordshire, November 29, 1600. He studied at Oxford, where he took the degree of D.D. Through the interest of Laud, in whose theory of church and king he devoutly believed, H. was appointed chaplain-in-ordinary to King Charles in 1629. Subsequently, he held a variety of livings, but was deprived of them during the period of the commonwealth. At the restoration, he was made sub-dean of Westminster, an office which many of his friends thought an utterly inadequate reward of his literary services to the royal cause. He died May 8, 1662. H. was a very voluminous controversial writer, but his works are of no value now, except as illustrative of the age in which he lived, and the ecclesiastical party to which he belonged. Among others may be mentioned, *History of the Sabbath*; *Ecclesia Vindicata*, or *the Church of England Justified*; *Theologia Veterum*; *Examen Historicum*, containing, among other things, a violent attack on Fuller's *Church History*, which involved him in a controversy with that author; *Historia Quinquarticularis*,

or a defence of Arminianism; *History of the Reformation of the Church of England*; and *Ærius Redivivus, or the History of the Presbyterians*.

HEYNE, CHRISTIAN GOTTLOB, a German scholar of great celebrity, was born at Chemnitz, in Upper Saxony, 25th September 1729. His father was a poor weaver. The pastor of Chemnitz, himself very poor, got H. educated at a school in the suburbs, and afterwards sent him to Leipsic university, but forgot to give him money for his support! His sufferings here were something frightful, but his endurance was heroic. In 1753, he obtained the situation of under-clerk in the Brühl library at Dresden. While in this humble office, he prepared his edition of *Tibullus*, which saw the light in 1755, and happening to fall into the hands of Rhunken of Leyden, excited the admiration of that scholar. In 1756, unfortunately for H., the Seven Years' War broke out. Frederick the Great marched against Dresden, and burned, among other things, the Brühl library, but not before H. had edited, from a *codex* there, the *Enchiridion* of Epictetus. For some time he led a precarious life, being often without employment, and without bread. In 1761, he married, and supported himself as best he could by writing for the booksellers; and in 1763, on the death of Gessner, professor of rhetoric at Göttingen, he was appointed his successor on the recommendation of Rhunken of Leyden (who had not forgotten his editions of *Tibullus* and *Epictetus*). This closed his period of misfortune. The rest of his long life was spent in peace and comfort and professional activity. He died 12th July 1812. The principal works of H., besides those mentioned, are his editions of Virgil (1767, 6th ed. 1803), Pindar (1774), Apollodorus (1787), Pliny (1790), Conon and Parthenius (1798), and Homer (8 vols. 1802; 2d ed. 1804). He also executed 'almost a cart-load of translations,' besides 'some ten or twelve thick volumes of Prolusions, Eulogies, and Essays,' of which six volumes were published separately under the title of *Opuscula Academica* (Götting. 1785—1812); and finally, about 7500 reviews of books in the *Göttinger Gelehrten Anzeigen*, of which he was director from 1770. In addition to this herculean work, he had a private class or *Seminarium* for the advanced study of philology and classical antiquity, from which he sent forth, in the course of his life, no less than 135 professors! Compare the Life of Heyne by his son-in-law, Ludwig Heeren (Götting. 1813), and Carlyle's essay on the same.

HEZEKIAH (Heb. *Hiskiah*, *Yehiskiyahu*, 'May Jehovah strengthen him'), king of Judah, son and successor of Ahaz, reigned from 726 [725] to 696 [697] B.C. 'There was none like him among all the kings of Judah,' is the praise bestowed upon him in 2 Kings xviii. 5, and scarcely less flattering is the account preserved of this monarch in 2 Chron. xxix. From the moment that, at the early age of five-and-twenty, he mounted the throne, his efforts seem chiefly to have been directed towards the abolition of the idolatry which reigned paramount in the land, and the restoration of the worship of Jehovah to its pristine purity and glory. The temple was reopened, the Priests and Levites whose genealogies had proved correct had their ancient revenues assigned to them, and recommenced the daily service; and the first passover which fell in H.'s reign, was—albeit a month after the appointed season—celebrated with almost unparalleled pomp for full fourteen days, amidst a vast concourse of people, not only of Judah, but even of Israel. Victorious in the wars he waged with the Philistines, and relying on an Egyptian alliance, into which he had entered

against the advice of Isaiah, H. dared also to withhold the annual tribute imposed by Shalmanassar in the days of his father: whereupon, as would appear from cuneiform records, Sargon, Shalmanassar's successor, invaded Judea, but without success. When, however, Sargon's successor, Sennacherib, on his way to Egypt and Ethiopia, had already seized Lachish, or, according to Chron. and Isaiah, 'all the fortresses' of Judea, nothing remained for H. but to ask for peace, and to offer any ransom that Sennacherib might deem fit to impose. Sennacherib took an enormous sum in silver and gold, for which the sacred treasury and the very doors of the temple were laid under contribution:—perhaps only a stratagem to convince the conqueror of the poverty of the royal coffers. It is a moot-point whether Sennacherib, after having received the money intended to procure the peace, treacherously marched upon Jerusalem at once, or whether he continued his march to Egypt, and being beaten there before Pelusium, besieged Jerusalem on his return—which would be equal to a second invasion. H.'s efforts to render his capital impregnable were futile. Suddenly, however, 'an Angel of the Lord' (explained variously to mean the plague, an earthquake, a sudden attack by Tirhaka, or the Simeon) slew during one single night 180,000 men in the Assyrian camp, and Sennacherib was obliged to retreat. Whether H.'s illness—'Shechin,' ulcers, according to some, or the plague, as others understand that word—took place before or after Sennacherib's invasion, is not fully established as yet; certain it is, that after his miraculous recovery, indicated to him by the retrograde movements of the dial, he, among other visits of congratulation, also received that of the ambassadors of Merodach Baladan (Mardocampados), king of Babylon. The latter—as would appear from the Chaldean historian Berosus—was at that time likewise tributary to Assyria, and sent the embassy with a view to securing H.'s co-operation against the common enemy. H., imprudently enough, made a great display of his treasures, his magazines, and arsenals; but so far from impressing the messengers with his greatness, he only kindled in Merodach Baladan the desire to possess himself of all these things; and the later Babylonian invasion ending in the captivity, is undoubtedly to be traced back to this act of vanity on the part of Hezekiah.

The remainder of H.'s life was passed in profound peace and prosperity, so that he was enabled to turn his attention to the internal development of the resources of the country, and the fortification of its towns. He collected great treasures and executed many highly useful works, among which the aqueducts of Jerusalem take a foremost place. His was also the golden age of prophetic poetry. Besides Isaiah, there lived in his time the prophets Micah and Nahum. From a passage in Prov. xxv. 1, it would also appear that he founded a society of literati, who collected and arranged the ancient documents of Hebrew literature, more especially the Proverbs attributed to Solomon. H. himself was a poet of no mean order; witness the hymn he composed after his recovery. H. died at the age of 54 years, in the 29th year of his reign, and was succeeded by his son Manasseh.

The Mishna (Pes. 4, 9) enumerates three things for which H. is to be praised, and three things for which he is to be blamed. The unworthy burial of his father, on account of his wickedness; the breaking of the brass serpent of Moses, which had become an object of idolatry; and the hiding of a 'book of medicaments'—some superstitious work—are the three good deeds. His spoiling the doors of the temple, to pay the tribute to Sennacherib;

the stopping up of the upper Gihon during the siege of Jerusalem; and his postponing the first passover for a month (see above), are his three wicked deeds.

HIBERNATION (from *hibernare*, to pass the winter) is the term applied by naturalists to express a peculiar condition of sleep in which certain animals—chiefly cheiroptera and rodentia—pass the winter season. It is not very clearly known to what extent hibernation prevails in the animal kingdom. The bats, the hedgehog, and the dormouse are the animals which in this country present the most striking examples of this phenomenon.

The term hibernation is not a good one, because summer heat produces in some animals a very similar condition to that which winter cold produces in others; and hence the Germans use the words *Winterschlaf* (winter sleep) and *Sommerschlaf* (summer sleep) to express the two similar if not identical conditions.

The following are the most marked peculiarities presented by bats, hedgehogs, and dormice, when in a state of perfect hibernation:—The respiration is very nearly suspended, as is shewn (1), by the absence of all detectable respiratory acts; (2), by the almost entire absence of any change in the air in the bell-jar or case in which the animal is placed during the investigation; (3), by the subsidence of the temperature to that of the atmosphere; and (4), by the capability of supporting, for a great length of time, the entire privation of air. The circulation is reduced to an extreme degree of slowness. In an observation made by Dr Marshall Hall, the heart of a bat was observed to beat only twenty-eight times in the minute. The excretions are very scanty. The bat is observed to have scarcely any excretion during its continued lethargy. In regard to the nervous system, sensation and volition are quiescent, but reflex or excitatory actions are very readily produced. The slightest touch applied to one of the spines of a hedgehog, or the merest shake given to a bat, induces one or two inspiratory movements. Dr Marshall Hall made the important discovery that, while the respiration is almost totally suspended, the muscular irritability is proportionally augmented. All hibernating animals instinctively adopt various measures to secure themselves, during the lethargic period, from sources of disturbance and excitement. They choose sheltered and retired situations, as caves, burrows, &c. Some form themselves nests; others congregate together in large numbers. The hedgehog and dormouse roll themselves up into a ball; the bats group together in clusters, with the head downwards, and in some species the wings are spread, so that each individual embraces and shelters its neighbour. Revivescence is due partly to the return of warmth, but mainly in all probability to the calls of hunger. The return of the respiration and animal heat to the normal standard is very gradual.

The physiological use of hibernation is doubtless to enable certain animals to avoid the consequences of severe winter cold, and (especially in the case of the insectivorous animals) the deprivation of food. Before the period of hibernation, a large amount of fat is accumulated in the organism, and this fat constitutes the fuel on which the animal lives and supports its comparatively trifling heat during the winter. The other tissues suffer to a less extent, and the total loss of weight is sometimes nearly 40 per cent.—a proportion fully as great as that which is usually sustained in death by starvation. For a full account of the phenomena of hibernation, the reader is referred to Barkow, *Der Winterschlaf nach seiner Erscheinungen im Thierreich dargestellt* (Berlin, 1846).

HIBERNIA, IBERNIA, IVERNIA, also **IERNE**, names by which Ireland is designated in the classical writers. The first mention of Ireland in ancient times occurs in a poem on the Argonautic expedition, attributed to the mythical Orpheus, and perhaps as early as the time of the first Darius. Aristotle speaks of two islands situated in the ocean beyond the pillars of Hercules, 'called Britannic, very large, Albion and Ierne, beyond the Celtae.' Both Diodorus Siculus and Strabo report the natives to be addicted to cannibalism; but, by their own admission, on insufficient grounds. Pomponius Mela, with quite an Irish warmth of eulogy, declares the herbage to be so luxuriant that the cattle who feed on it sometimes burst. Pliny repeats this statement, and adds that the Hibernian mother trains her child from the very first to eat food from the point of a sword. But the most important of all classical authorities on H. is Ptolemy, who describes the country, and gives the names of the principal rivers, promontories, seaports, and inland towns. The island was never conquered, nor even explored, by the Romans. See IRELAND.

HIBISCUS, a genus of plants of the natural order *Malvaceæ*, the type of a tribe or sub-order distinguished by a double calyx and fruit of three or more many-seeded carpels united into a many-celled capsule. The species are numerous, natives of warm climates, some of them trees or shrubs, but most of them large herbaceous plants, annual or perennial. The flowers of many are very beautiful. *H. Syriacus*, sometimes called *Althæa frutex*, a native of Syria and Carniola, has long been in cultivation as an ornamental shrub, and proves sufficiently hardy in many parts of Britain. Some are favourite hothouse plants. The characteristic mucilaginous and fibrous properties of the *Malvaceæ* are very strongly developed in this tribe. *H. Abelmoschus* (or *Abelmoschus esculentus*) so abounds in mucilage, that it is much used in the north-west of India for clarifying sugar. The fruit of *H. esculentus* (or *Abelmoschus esculentus*) is in general use both in the East and West Indies for thickening soups, and otherwise as an article of food. It is called GOMBO, GOBBO, and OCHRO in the West Indies; BANDIKAI, RAM-TURAI, and DENROOS in different parts of India; and BAMBIA in the west of Africa; if indeed the East Indian *H. longifolius* and the African *H. Bammia* are, as seems probable, mere varieties. It is an annual plant, with a soft herbaceous stem, 3—5 feet high, crenate leaves, axillary sulphur-coloured flowers, and pyramidal, somewhat podlike capsules. It is cultivated in some parts of the south of Europe. The fruit is used in an unripe state. It is generally much esteemed, but is disliked by some on account of its viscosity. It enters, as an important ingredient, into the *pepper-pot* of the West Indies. The ripe seeds are sometimes used in soups as barley. The bark of *H. tiliaceus*—a tree of twenty feet high, with a very thick bole—so abounds in mucilage, that by chewing it the natives of the South Sea Islands obtain nourishment in times of scarcity. This tree, the BOLA of Bengal—supposed to be the same with the MOHO or MOHAU of the West Indies (*H. arboreus*)—is one of the most abundant trees of the South Sea Islands; and the wood being light, tough, and durable, is much used for many purposes. The bark is very fibrous, and cordage and matting are made of the fibre in various tropical countries. Many other species yield fibres, some of them coarse, some of them fine and beautiful, which are used in different countries; but the most important in this respect is *H. cannabinus*, the AMBAREE HEMP and DECKANEE HEMP of Western India,

called PALUNGGOO at Madras, and MAESTA PAUT in Bengal; a plant very generally cultivated in all parts of India, although nowhere to a great extent. It is an annual herbaceous plant, having a straight unbranching stem, 3—7 feet high. The fibre is not so strong as hemp, and is useful only for ropes and coarse fabrics. It has been suggested that many species of *H.* might be found valuable for the manufacture of paper.—*H. Sabbdariffa* is very generally cultivated in warm countries, on account of its calyx, which, as the fruit ripens, becomes fleshy, and acquires a very pleasant acidity. It is much used for making tarts and jelly, and a decoction of it, sweetened and fermented, affords a refreshing beverage, well known in the West Indies as *Sorrel Cool Drink*, the plant being called RED SORREL. *H. Abelmoschus* (or *Abelmoschus moschatus*), sometimes called MUSK SEED, another plant common in widely separated tropical countries, is cultivated for its seeds, which have a fragrance between that of musk and that of amber. They are much used by perfumers, and are called *Ambrette* or *Graines d'Ambrette*. In Egypt and Arabia they are mixed with coffee, and stimulant and stomachic qualities are ascribed to them. The petals of *H. Rosa-Sinensis* are astringent, and are used by the Chinese to stain their eyebrows and their shoes black.

HICCUP, or HICCOUGH, consists of sudden short convulsive inspirations, attended with a peculiar sound produced in the larynx, and immediately followed by expiration. The movements concerned in the production of hiccup are a spasmodic contraction of the diaphragm, and a certain degree of constriction in the glottis, which occasions the peculiar sound, and limits the amount of air inspired. These convulsive inspirations commonly occur in paroxysms, and succeed each other at intervals of a few seconds. The paroxysm may last only a few minutes, or may extend to hours or days; in the last-named case, it may be dangerous to life, from the exhaustion which it causes, but usually it merely excites a feeling of uneasiness or slight pain about the region of the diaphragm.

A debilitated state of the system predisposes to hiccup. In those predisposed to it, any gastric derangement, as emptiness, or over-distention of the stomach, the ingestion of cold water, excessive acidity, &c., will provoke it. Certain diseases are frequently attended by hiccup.

When the attack is slight, it may often be stopped by making a very full inspiration, and then holding the breath as long as possible, the diaphragm being thus held in a state of voluntary contraction. Strong pressure, as a belt tightly drawn round the waist, will sometimes give relief. In more obstinate cases, aromatic spirit of ammonia, camphor, musk, &c., may be resorted to. A combination of camphor and chloroform, and the frequent swallowing of small rounded pieces of ice, are perhaps the most efficient remedies.

HICKES, GEORGE, D.D., an eminent English divine and philologist, was born at Newsham, Yorkshire, June 20, 1642. He studied at Oxford, and in 1664 was elected fellow of Lincoln College. In 1665 he passed M.A., and in 1666 was admitted into orders. In 1676 he became chaplain to John, Duke of Lauderdale, whom, in 1677, he accompanied to Edinburgh. In 1678 he received the degree of D.D. from the university of Glasgow, and in 1679 from that of Oxford. In 1682 he was appointed one of the king's chaplains, and the following year made dean of Worcester. Refusing at the revolution to take the oaths to King William III., he was deprived of all his benefices. In 1693 he was sent with a list of the nonjuring

clergy to the exiled king at St Germain, and in 1694 was consecrated by a prelate of his own party suffragan bishop of Thetford. His publications in controversial and practical divinity are numerous. His greatest work, entitled *Thesaurus Grammatico-Criticus et Archaeologicus Linguarum Veterum Septentrionalium*, appeared at Oxford in 1705, 3 vols. fol. He died December 15, 1715.

HICKORY (*Carya*), a genus of trees formerly included among Walnuts (*Juglans*). The Hickories are exclusively North American. They are large and beautiful trees, attaining a height of 70 or 80 feet, with pinnate leaves. The timber of all of them is very heavy, strong, and tenacious, but decays speedily when exposed to heat and moisture, and is said to be peculiarly liable to injury from worms. Great quantities of *H.* are used to make hoops for casks. It is much used for handspikes. Musket-stocks, shafts of carriages, handles of whips, large screws, &c., are made of it. It is greatly esteemed for fuel. The nuts of some of the species are excellent eating, and much resemble walnuts.—*C. alba*, the SHELL-BARK or SHAG-BARK *H.*, so called from its shaggy outer bark peeling off in long narrow plates, yields the common hickory-nut of the northern parts of the United States; also known as the *Kisky Thomas Nut*. It abounds on Lake Erie, and in some parts of New Jersey and Pennsylvania. The trunk is slender. The leaves are often 20 inches long. The nuts are in considerable request, and are sometimes exported. The shell is thin but hard, the kernel sweet. An oil, which is used by the Indians as an article of food, is obtained from it by pounding and boiling.—*C. sulcata*, the THICK SHELL-BARK *H.*, a very similar tree, abounding in the fertile valleys of the Alleghany Mountains, has a nut with a thick yellowish shell, which is often brought to market in America, under the names of Springfield Nut and Gloucester Nut.—*C. oliviformis* yields the PACANE, or PECAN NUT, sometimes called the Illinois Nut.—Other species yield the MOCKER NUT, PIG NUT, and BITTER NUT.

HICKS, ELIAS, a celebrated American preacher of the Society of Friends, was born at Hempstead, Long Island, March 19, 1748. His gifts were early recognised by the society, and at the age of 27 he had become a well-known preacher, and for many years travelled through the States and Canada. His unitarianism, or denial of the divinity of Christ and a vicarious atonement, brought him into disfavour with orthodox Friends; but he preached his own views with perseverance, and at the age of 80 still travelled and preached. The result of his labours was a schism of the society into two divisions, popularly known as Orthodox and Hicksite Quakers. He died at Jericho, Long Island, February 27, 1830. See Elias H.'s *Journal of his Life and Labours* (Philadelphia, 1828).

HIDALGO (Spanish, in Portuguese, *Fidalgo*; a word derived by some from *hijo del Goto*, 'son of a Goth,' implying purity of descent, and by others from *hijo de alguno*, 'son of somebody') is the title of a class of the lower nobility in Spain.

HIERA PICRA, or HOLY BITTER, once a highly popular remedy, and still much employed in domestic medicine, and in veterinary practice, is composed of four parts of powdered aloes and one part of canella. It is identical with the official preparation known as *Pulvis Aloës cum Canellâ*. The principal objection to its use as a purgative medicine is, that the nauseous taste of the aloes is not concealed by the canella; and that, like aloetic preparations generally, it is liable to cause irritation of the lower part of the intestinal canal.

HIERACIUM. See HAWKWEED.

HIERARCHY (Gr. *hieros*, sacred, and *archo*, to govern), the name used by theological writers to designate the whole sacred governing and ministering body in the church, distributed according to its several gradations. The word, in its strict acceptation, is, of course, only applicable to the Roman Catholic Church, and to those Christian communities which retain the prelatical form of church government, or at least the distinctions of ecclesiastical order and gradation. In considering the hierarchy of the Catholic Church, it is necessary to bear in mind the well-known distinction of *order* and of *jurisdiction*. I. Considered under the head of *order*, the hierarchy embraces all the various orders or classes of sacred ministers to whom has been assigned the duty of directing the public worship, administering the sacraments, and discharging the various other offices connected with the preaching of the gospel; and these are of two kinds—the orders directly instituted by divine authority, and those established by ecclesiastical ordinance. Theologians commonly distinguish a *hierarchy of divine right*, and a *hierarchy of ecclesiastical right*. (1.) The first includes the three ranks of bishops, priests, and deacons. The bishops are believed, as successors of the apostles, to have inherited the integrity of the Christian priesthood. The order of episcopate, however, is not believed to be a distinct order from that of priesthood, but only a fuller and entirely unrestricted form of that order. In all that regards what Catholics believe to be the Christian sacrifice of the eucharist, they hold that the priest possesses the same powers of *order* with the bishop; but he cannot confer the sacrament of orders, nor can he validly exercise the power of absolving in the sacrament of penance without the approbation of the bishop. The office of deacons is, to serve as helpers of the priests and bishops, especially in the administration of the eucharist and baptism, and in the relief of the material as well as the spiritual necessities of the faithful (Acts vi. 1, and foll.). (2.) To the three ranks thus primitively instituted, several others have been added by ecclesiastical ordinance. See **ORDERS, MINOR**. II. The *hierarchy of jurisdiction* directly regards, and is founded upon, the government of the church, and it comprises not only all the successive degrees of ecclesiastical authority derived from the greater or less local extension of the several spheres within which such governing authority is limited—beginning with the pope as primate of the universal church, and extending to the patriarchs as ruling their several patriarchates, the primates in the several kingdoms as national churches, and the metropolitans or archbishops within their respective provinces;—but also, although less properly, the ecclesiastical grades which, although ecclesiastical jurisdiction may be attached to them, are more directly honorary in their nature, as those of the cardinalate, the archiepiscopate, and the archidiaconate.

In the Anglican Church, with the office of the episcopate, the theory of a hierarchical gradation of rank and of authority has been retained. The Anglican hierarchy comprises bishops, priests, and deacons. In the Scottish Church it is of course unknown, as it is in the greater number of the foreign Protestant churches; while those Lutheran communities which have retained or have revived the title of bishop, concede little to the office which can be considered as imparting to the distinction of grades in the ministry which it imports a strict hierarchical character. The Lutheran bishop has little beyond his brother-ministers, except the right to bear certain insignia, and the first place in the consistories.

In the well-known work, *The Celestial Hierarchy*,

falsely ascribed to Dionysius the Areopagite, the hierarchy includes Christ as its head, and the various orders of angels as his ministering spirits.

HIERATIC WRITING. See **HIEROGLYPHICS**.

HIERO I., king of Syracuse, succeeded his brother Gelon in the year 478 B.C. The most important event of his reign was the naval victory gained by his fleet and that of the Cumani over the Etruscans in 474, which deprived the latter of their supremacy in the Tyrrhenian Sea. In the year 472, Thrasidæus, who had meanwhile become tyrant of Agrigentum, was conquered by Hiero. H. himself was violent and rapacious, far inferior in character to his brother Gelon. His love of poetry, and the manner in which he entertained poets like Simonides, Eschylus, Bacchylides, and Pindar at his court, have perhaps caused him to be overestimated.

HIERO II., king of Syracuse (269—214 B.C.), was the son of a noble Syracusan named Hierocles. During the troubles which prevailed in Sicily, after the retreat of King Pyrrhus, 275 B.C., H. greatly distinguished himself, and was first appointed commander-in-chief, and then elected king. He joined the Carthaginians in besieging Messana, which had surrendered to the Romans, but he was beaten by Appius Claudius the Roman consul, and obliged to retire to Syracuse, where he was soon blockaded. In 263, seeing himself threatened by a large army under Manius Valerius Maximus, he concluded a peace with the Romans for fifteen years, during which he proved so faithful to his engagements, that in 248 peace was permanently established. H. himself visited Rome in 237, on which occasion he presented the Roman people with 200,000 bushels of corn. In the second Punic War he likewise proved himself the faithful ally of the Romans, and supported them with money and troops, especially after their defeat at the lake of Thrasymene, when the golden statues of the goddess of Victory, weighing 320 pounds, which he sent to Rome, were welcomed as a good omen. He died about the year 216, in the 92d year of his age. His son Gelon having died before him, he was succeeded by his grandson Hieronymus. H., by his clemency, wisdom, and simplicity, had gained the affections of the Syracusans, who refused on several occasions to accept his resignation of the kingly office. He devoted great attention to the improvement of agriculture, and his laws respecting the tithe of corn, &c. (*Leges Hieronicae*), were still in force in the country in Cicero's time. He was likewise a patron of the arts, particularly architecture. In these pursuits, as well as in the construction of warlike machines, he was assisted by his friend and relative Archimedes.

HIEROCLES, a common name among the Greeks. The most celebrated of this name was H., the Neo-Platonist, who lived at Alexandria about the middle of the 5th c., and enjoyed a great reputation. He is usually reckoned the author of a commentary on the golden verses of Pythagoras, of which the best edition is that by Warren (Lond. 1742). Of H.'s history we know nothing. His most celebrated works are—*On Providence, Fate, and the Harmony between the Divine Government and Man's Free-will*; of which there remain only a few extracts preserved by Photius, and published by Morelli (Paris, 1593 and 1597). Another ethical work of his, *On Justice, Reverence of the Gods, and the Domestic and Social Virtues*, is known to us from a number of extracts in Stobæus. There is also a work called *Asteia* ('a collection of jests and ludicrous stories') attributed to him, but it is now believed to belong to a much later age than that of Hierocles. This and the previous works are contained in Pearson and

Needham's Commentary on Pythagoras (Cambridge, 1709).

HIEROGLYPHICS (literally meaning sacred sculptures), a term applied to those representations of natural or artificial objects used to express language, especially those which the ancient Egyptians and Mexicans employed for that purpose. The term *hieroglyph* would, however, be more correctly applied to these figures. The number of those used by the ancient Egyptians was probably about 1000, and by their means they were enabled to express all the ideas required with correctness, clearness, and facility. They consist of representations of celestial bodies, the human form and its parts in various attitudes, animals, fishes, reptiles, works of art and attire, and fantastic forms. These were either engraved in relief, or sunk below the surface on the public monuments and objects of hard materials suited for the glyptic art, or else traced in outline with a reed pen on papyri, wood, slices of stone, and other objects. The scribe, indeed, wrote from a palette or canon called *pes*, with pens, *kash*, from two little ink-holes in the palette, containing a black ink of animal charcoal, and a red mineral ink. The hieroglyphs on the monuments are sometimes sculptured and plain; at others, decorated with colours, either one simple tone for all the hieroglyphs, which are then called monochrome; or else ornamented with a variety of colours, and then called polychrome; and those painted on coffins and other objects are often first traced out, and then coloured in detail. On the papyri and some few inferior materials, they are simply sketched in outline, and are called linear hieroglyphs. The hieroglyphs are arranged in perpendicular columns, separated by lines, or in horizontal, or distributed in a sporadic manner in the area of the picture to which they refer. Sometimes all these modes of arrangement are found together. One peculiarity is at once discernible, that all the animals and representations face in the same direction when they are combined into a text; and when mixed up with reliefs and scenes, they usually face in the direction of the figures to which they are attached. When thus arranged, the reliefs and hieroglyphs resemble a MS., every letter of which should also be an illumination, and they produce a gay and agreeable impression on the spectator. They are written very square, the spaces are neatly and carefully packed, so as to leave no naked appearance of background. Generally, they are to be read from the direction in which they face, and the lines follow in the same succession, but many exceptions occur, in which they follow the reverse order, whether written horizontally or vertically, and this at all periods.

The hieroglyphs, in their nature, are divided into two great classes—*Ideographs*, or those which represent ideas; and *Phonetics*, or those which express sounds. No doubt, at the first commencement of the language, ideographs only were employed; but the earliest known monuments, which ascend to the 3d dynasty above 2000 years B.C., are filled with phonetic hieroglyphs, shewing that at that early period the principle of writing sounds had been completely developed. These hieroglyphs, at the most developed period of the language, comprised about one-third of the texts. The ideographs are divided into two classes—the simple ideographs, or those which express one idea; and the determinatives, which are used to indicate many. In all instances, these ideographs are occasionally found preceded by phonetic groups, which give the sound of the idea they are intended to express in the written language; the simple ideographs being found only preceded by one group; while

the determinatives are preceded by many. The pure ideographs are of various classes: first, those representing the object directly, as , a dog, *uhar*, to express the idea dog; secondly, those metaphorically conveying the required meaning, as , a woman beating a tambourine to indicate 'joy,' in which the action indicates the effect produced; thirdly, that in which the attribute is expressed by the figure of some object possessing it, as , a jackal, to indicate 'cunning' or 'craft'; a  flaming censer, to signify 'incense.' Or the direct action was often represented; as a bird fishing , to express the idea of fishing in general. Such a mode of depicting ideas in detail was only suited for elaborate monuments; and the number of ideographs required to express all ideas, would have been so many as to have overwhelmed the memory of the learner, and to have obscured the comprehension of the reader. In order, therefore, to reduce the number of *ideographs*, a certain number of these hieroglyphs were used to express more ideas than one in the principal classes of thought. Thus, , a seated man, originally employed to signify man, was applied to all relationships, functions, and offices of men, as *af*, father; *sen*, brother; *mer*, governor; *hentneter*, priest; *bak*, labourer: the special meaning which it conveyed being shewn by the phonetic groups which preceded it. In the same way, all beasts or objects made of leather were expressed by a skin, ; all precious stones or objects made of the same by a ring, ; all actions of locomotion by , two legs in the act of walking; and all actions in which the arms were used by , an arm holding a stick. The number of these signs may be computed at about 175, and they resemble in their use those of the Assyrian cuneiform, in which, although to a more limited extent, the leading classes of thought were determined by a character prefixed to the phonetic group giving the particular idea. Thus, in the Assyrian, all names of men are preceded by , a single upright wedge; all countries by , three wedges disposed obliquely; and names of horned cattle by the group of five wedges . In the Egyptian system, however, the determinatives are always placed after the phonetic groups, and are more numerous. The Chinese system of writing approaches still more closely to the Egyptian, 242 radicals, as they are called, but really determinatives, being placed after other groups and symbols, which indicate the special idea intended. In this last language, the radicals are generally placed to the left, as , *haou*, 'good,' in which the radical is , *neu*, 'a woman,' except in those instances in which they enclose the phonetic or special groups. In the Egyptian hieroglyphs, every word not expressing an abstract idea, as the verb to be, or the grammatical forms, and pronouns, is accompanied by its determinative, and is incomplete without it. The genius of the writing is that the phonetics and ideographs mutually explain each other. Sometimes, indeed, by a kind of redundant pleonasm, the determinatives are placed after the special ideographs, as , the three rings of metal after the cape used to express gold and silver; , the three flowers after the lily, to signify

lily; and , the skin after the goat, to mean goat. The phonetic portion of the hieroglyphs consists, at the best period of writing, of a limited number of signs, about 130, employed as a syllabarium; and although the term alphabet has been often used in speaking of the phonetic hieroglyphs, nothing of the nature of a pure alphabet existed till a later period, when the Phœnicians invented a purely alphabetic system, suppressing the vowels, which the Greeks still further improved by reintroducing them into their graphic system, and so brought to perfection the invaluable invention of alphabetic writing, at once concise, compendious, and complete. But the Egyptian hieroglyphs comprise two classes of syllables—those ending with vowels, or the so-called alphabetic, and those ending with consonants; or, in other words, of monosyllables and polysyllables. As the monosyllables enter into the composition of the polysyllabic groups, it is evident that they are older than the biliteral or dissyllabic hieroglyphs. The spoken language seems, in fact, to have originally consisted of monosyllables, which were subsequently enriched by agglomeration, and combined into biliteral and trilateral roots. Several of these monosyllabic words have descended from the ancient language to the Coptic, as *ab*, a lamb; *au*, a cow; *mau*, a lion; *ra*, the sun; *pe*, the heaven. Numerous words of this class may still be traced as the roots of the more ancient language, but it is obvious that only a few of the most manageable could be selected for the combined purposes of sound and writing. In some instances, two or more seem to have been selected for the same sounds, in order to suit the style of writing, horizontal or vertical signs being required for the careful packing of the groups in the texts. Now, it will be necessary to bear in mind that each of these hieroglyphs of the first phonetic division represents a monosyllable, of which it represents the whole by itself considered as the initial, but that it was always capable of having the vowel hieroglyph which followed the initial placed after it, and that in the hieratic or cursive Egyptian writing, this was generally the case, in order to distinguish the signs. This final vowel is, however, generally omitted in hieroglyphic texts, and is said to be *inherent*, or ought to be pronounced in the first hieroglyph. The alphabetic syllabarium is as follows:

	an eagle, <i>Äa</i> .		{ fore-part of lion, <i>Hä</i> .
	an arm, <i>Äa</i> .		twisted cord, <i>Hi</i> .
	a reed, <i>Au</i> .		a tusk, <i>Hu</i> .
	a heron, <i>Ba</i> .		a club, <i>Hu</i> .
	a leg, <i>Bu</i> .		two reeds, <i>Iu</i> .
	a cerastes, <i>Fi</i> .		{ two oblique strokes, <i>Iu</i> .
	an eaglet, <i>Ga</i> .		a bowl, <i>Kä</i> .
	a vase, <i>Ga</i> .		{ leaf of water-lily, <i>KHa</i> .
	a viper, <i>Gi</i> .		{ a mormorus fish, <i>KHa</i> .
	leg of a stool, <i>Ha</i> .		a mace, <i>KHa</i> .
	a house, <i>Ha</i> .		a sieve, <i>KHi</i> .
	{ a papyrus plant, <i>Ha</i> .		

	{ a calf, <i>KHu</i> , or <i>Au</i> .		a stand, <i>Qa</i> .
	{ a garment, <i>KHu</i> , or <i>Au</i> .		top of quiver, <i>Sa</i> .
	a lion, <i>Ru</i> , or <i>Lu</i> .		a goose, <i>Sa</i> .
	{ a mouth, <i>Lu</i> , or <i>Ru</i> .		a woof, <i>Sa</i> .
	a pen, <i>Ma</i> .		a reed, <i>Su</i> .
	a weight, <i>Ma</i> .		a bolt, <i>Su</i> .
	a hole, <i>Mä</i> .		{ back of chair, <i>S(en or -et)</i> .
	an owl, <i>Mu</i> .		a garden, <i>SHa</i> .
	a vulture, <i>Mu</i> .		part of dress, <i>SHa</i> .
	a water-line, <i>Na</i> .		a pool, <i>SHi</i> .
	a red crown, <i>Na</i> .		a spindle, <i>Ta</i> .
	a vase, <i>Nu</i> .		a hand, <i>Ti</i> .
	a goose flying, <i>Pa</i> .		twisted cord, <i>Ti</i> .
	a shutter, <i>Pu</i> .		a muller, <i>Tu</i> .
	a knee, <i>Qa</i> .		a duckling, <i>Ui</i> .
			a twisted cord, <i>Ui</i> .

This comprises all the signs which may be considered alphabetic in their nature, at the best period, or from the 4th to the 21st dynasty, when a revolution took place in the mode of writing, and about 90 additional signs, taken from the ideographs and syllabics, were added to the preceding alphabetic, and used indiscriminately—not, indeed, all at once, but by gradual introductions, from the 21st dynasty till the 2d c. A.D. Nor are all the signs of the preceding alphabet of equal antiquity, or as much used as others. As to the inherent nature of the vowels, it may be observed that  A, the commonest, is often

written with its complement  u after it, as  Au, and that  V is indifferently expressed with  u, as  V, Ha. Of the three forms of the A, the first expresses the aspirate, the second the nasal, and the third the soft breathing. Besides, too, their final complement, the initial sound, especially of consonants, probably of those newly introduced into the system, was placed before them, to explain their use. Thus  Nu, preceded by *N*, and followed by *u*, and others in the like manner. The consideration of the signs that precede and follow after, indeed determines the sonal value of certain hieroglyphics which are thus encased and explained by other phonetics. The syllabics are constructed on the same plan. They consist of an initial hieroglyph, which is capable of expressing by itself the whole syllable, as  Am,  Her, but which take after them their inherent consonant or complement, as  Am.

AM,  HER, and are sometimes preceded by their initial complement, as    . These are

more numerous than the alphabetic-syllabic class, and are as commonly used in the texts. The language had impressed upon it by this mode of writing a certain ideographic character, which it retained, certain words being only written by certain syllabics, and the use of the two syllabaries was by no means promiscuous, the examples of different modes of grouping the same word being abnormal, and referable only to long intervals of time. For although several hundred papyri exist in the museums of Europe, and no two are written precisely alike, yet the greatest differences will be observable in those which are similar texts, written at long intervals of time from each other. Nevertheless, some latitude prevails in the writing of certain words and proper names, and those hieroglyphs which appear in the corresponding places of others are called *variants* or *homophones*. Sometimes the same proper name is represented by six different groups of hieroglyphs, yet they could only have been pronounced in one way, as they represent the same name, and the different hieroglyphs are consequently only interchanged to express the same sounds.

The language of the hieroglyphs is nearest to the Coptic, the form which it assumed about the 3d c. A. D., when the Greek alphabet, reinforced by letters borrowed from the demotic or popular cursive hand of the period, superseded the demotic and hieroglyphic mode of writing. This language, extinct only as spoken about a century and a half ago (see COPTIC), differs considerably from the monumental texts, having been corrupted by the introduction of Greek, Latin, and Arabic words, but this contains, as its base, the old language of the country—a tongue analogous in some respects to the Semitic dialects, but in others of a construction which may be called Hamitic, or allied to the African. The great peculiarity of the hieroglyphic language is, that the verbal root both of the nouns, adjectives, and verbs remains unchanged, and that the dual and plural are made by postfixes, the cases of the nouns formed by prepositions, and the tenses of the verbs by the prefixing of the declined abstract auxiliary verbs, Au, An, or Kheper, to be; or by the affixing of the pronouns *a, k, t, f, s, nen, ten, sen*, preceded by prepositions, to the verbal roots. The pronouns are either detached and prefixed or affixed, and the prepositions are either simple or compound; many remarkable forms of the last class existing in the language. There is a great vagueness in their employment, and their meaning is often abnormal, and only defined by the context.

Considered as the most ancient written language, the hieroglyphs throw great light upon comparative philology, the relative antiquity of various words and locutions, the general construction of language itself, and the development of picture-writing into the abstract ciphers of sound, called letters. A great portion of the words are similar to the Semitic, either directly or indirectly: thus *iuma*, the sea, is like the Hebrew *yam*; *kaf*, an ape, like *qof*. The majority are, of course, purely Coptic; but at the period of the 19th dynasty, or about 1300 B. C., many Hebrew, Syriac, and Aramaic words were introduced into the language by the progress of the Egyptian arms to the East, and such words as *bata* for *Beth*, a house, *makaturu* for *Migdol*, a tower, and others, appear; they are, however, rare and few in number compared to the body of the language. Many other words appear to be

Indo-Germanic. The literature will be found under the word PAPYRUS.

The invention of hieroglyphs, called *Neter khuru*, or 'divine words,' was attributed to the god Thoth, the Egyptian Logos, who is repeatedly called the scribe of the gods, and lord of the hieroglyphs. Pliny attributes their invention to Menon. The literature of the Egyptians was in fact called Hermaic or Hermetic, on account of its supposed divine origin, and the knowledge of hieroglyphs was, to a certain extent, a mystery to the ignorant, although universally employed by the sacerdotal and instructed classes. To foreign nations, the hieroglyphs always remained so, although Moses is supposed to have been versed in the knowledge of them (*Philo*, vita Moysis); but Joseph is described as conversing with his brethren through interpreters, and does not appear to allude to hieroglyphic writing. The Greeks, who had settled on the coast as early as the 6th c. B. C., do not appear to have possessed more than a colloquial knowledge of the language; and although Solon, 538 B. C., is said to have studied Egyptian doctrines at Sebennytus and Heliopolis, and the doctrines of Pythagoras are held to have been derived from Egypt, these sages could only have acquired their knowledge from interpretations of hieroglyphic writings. Hecataeus (521 B. C.) and Herodotus (456 B. C.), who visited Egypt in their travels, obtained from similar sources the information they have afforded of the language or monuments of the country. Democritus of Abdera, indeed, about the same period (459 B. C.), had described both the Ethiopian hieroglyphs and the Babylonian cuneiform, but his work has disappeared. After the conquest of Egypt by Alexander, the Greek rulers began to pay attention to the language and history of their subjects, and Eratosthenes, the keeper of the museum at Alexandria, and Manetho, the high-priest of Sebennytus, had drawn up accounts of the national chronology and history from hieroglyphic sources. Under the Roman empire, in the reign of Augustus, one Chæremon, the keeper of the library at the Serapeum, had drawn up a dictionary of the hieroglyphs; and both Diodorus and Strabo mention them, and describe their nature. Tacitus, later under the empire, gives the account of the monuments of Thebes translated by the Egyptian priests to Germanicus; but after his time, the knowledge of them beyond Egypt itself was exceedingly limited, and does not reappear till the 3d and subsequent centuries A. D., when they are mentioned by Ammianus Marcellinus, who cites the translation of one of the obelisks at Rome by one Hermapion, and by Julius Valerius, the author of the apocryphal life of Alexander, who gives that of another. Heliodorus, a novelist who flourished 400 A. D., describes a hieroglyphic letter written by Queen Candace (iv. 8). The first positive information on the subject is by Clement of Alexandria (211 A. D.), who mentions the symbolical and phonetic, or, as he calls it, cyriologic nature of hieroglyphics. Porphyry (304 A. D.) divides them also into onenologic or phonetic, and enigmatic or symbolic. Horapollo or Horus-Apollo, who is supposed to have flourished about 500 A. D., wrote two books explanatory of the hieroglyphs, a rude, ill-assorted confusion of truth and fiction, in which are given the interpretation of many hieroglyphs, and their esoteric meaning. After this writer, all knowledge of them disappeared till the revival of letters. At the beginning of the 16th c., 1529 A. D., these symbols first attracted attention, and soon after Kircher, a learned Jesuit, pretended to interpret them by vague esoteric notions derived from his own fancy, on the supposition that the hieroglyphs were ideographic, a theory which barred all progress,

and was held in its full extent by the learned, till Zoega, at the close of the 18th c., 1787 A. D., first enunciated that the ovals or cartouches contained royal names, and that the hieroglyphs, or some of them, were used to express sounds. More monuments were known, and juster ideas had begun to dawn on the European mind; and the discovery by the French, in 1799, of the so-called Rosetta Stone, a slab of black granite, having inscribed upon it, first in hieroglyphics, secondly in demotic or enchorial (a cursive popular form of writing extant at the period), and thirdly in Greek, a decree of the priests of Egypt assembled in synod at Memphis, in honour of Ptolemy V., gave the first clue to the decipherment. The first attempts, indeed, were made upon the demotic text by Silvestre de Sacy with some success, but it was soon discovered that the demotic was not purely alphabetic. Crude notions of the ideographic nature of the hieroglyphs prevailed till Dr Young, in 1818, first gave out the hypothesis, that the hieroglyphs were used as sounds in royal proper names. He was led to this conclusion by tracing the hieroglyphs through the cursive hieratic to the more cursive demotic; and as this last was known to be alphabetic, he deduced that the corresponding hieroglyphic signs were so. In this manner, he came to the conclusion that the first

hieroglyph in the name of Ptolemy 

in the Rosetta Stone (a mat) represented a P; the second (hemisphere) a T; the third (a loop) he supposed to be superfluous; the fourth (a lion) he read OLE; the fifth and sixth, the syllable MI; and seventh, the back of the seat, an S. Unaided by bilingual monuments, he essayed to decipher the name of Berenice, and altogether established the value of five hieroglyphs as letters out of two names, but was unable to proceed further. Champollion, in 1822, by means of an inscription found on an obelisk at Philæ, which had at the base a Greek inscription, recognised the name of Cleopatra, and by comparison with that of Ptolemy, at once proved the purely alphabetic, not syllabico-alphabetic nature of the signs. Extending the principle, he read by its means the names of the Greek and Roman, and finally those of the native monarchs. It was soon seen that the same hieroglyphs as those used in these names were extensively used in the texts for words, and these words turned out, in most instances, to be analogous to the Coptic. Although the discoveries of Champollion were received by many of the learned in Europe with distrust, yet his method of research was slowly adopted by Rosellini and Salvolini in 1832, and subsequently extended methodically by Lepsius in 1837, and by Bunsen, Hincks, De Rougé, Birch, Goodwin, Chabas, and others.

The method of interpretation adopted has been strictly inductive, the value of the characters being deduced from the equation of sounds, or homophones of similar groups. The meaning of the groups or words has been determined by examining all known instances in which they occur in passages capable of being interpreted, that of the ideographs by observing the form of the symbols; many of them have been made out from the pictures which they explain, or the phonetic groups which accompany them. A careful comparison has been instituted with corresponding Coptic and Hebrew roots when they exist. In short, a careful principle of induction has been applied to the study of the hieroglyphs.

An attack upon the principles of hieroglyphical interpretation has been recently made by Sir G. Cornwall Lewis, in his *History of Ancient Astronomy*. This writer demurs to the premises on which the interpretation is based, and does not consider

the first steps sufficiently proved, but holds that the results have been obtained by a series of vicious hypotheses, and that the Coptic by no means is the language of the ancient Egyptians. He also relies on the fact of the phonetic nature of the symbols not having been mentioned by the Greek writers. The inductive method of interpretation he considers unsound. The objections brought forward have, however, been strongly rebutted by the Egyptologists; the basis is considered sure from the bilingual monuments of the Rosetta Stone, obelisk of Philæ, contracts, rituals, and other documents; the truth of the phonetic value of the symbols is also thought to be proved beyond a doubt, by the fact of the sounds obtained from the first sources enabling the names of Roman emperors, Ptolemies, and even many Pharaohs, to be read with facility; while the fact of the Coptic being the remains of the ancient language of the country, is proved by its corresponding with the names of Egyptian objects and persons mentioned by Herodotus and other Greek authors. The truth of the interpretation is also defended by the results obtained, and the fact that these results enable the hierologists to read with ease documents and monuments newly discovered. Whatever doubt, in fact, may exist as to the minor details and more delicate shades of language, the labours of the last half century have analysed and established all the principal grammatical forms, and three-fourths of the words of the old Egyptian language. The study of the hieroglyphics has been formally recognised by the learned academies of Europe as a branch of Oriental learning.

The hieroglyphs stood in the same relation to the two other forms of writing the character, called hieratic and demotic, as type does to handwriting. Their use was chiefly for official inscriptions on public or private monuments, religious formulæ and prayers, and rituals or hermetic books (see Papyrus). The most remarkable hieroglyphic inscriptions are—that in honour of Khnumhetp at Benihassan, recording the investment of his family; the campaigns of Ahmes against the Hyksos at El-Kab; the annals of Thothmes III. at Karnak, the campaign of Rameses II. against the Khita, and the treaty; the account of the tank for gold-washings in the reign of Seti I. and Rameses II. at Kouban and Redesich; the star-risings on the tomb of Rameses V.; the journey of the ark of Khons to Bakhtan, in the reign of Rameses X.; the account of Cambyse and Darius on the statue of the Vatican.

In connection with the hieroglyphics are two modes of writing them, first the *hieratic* writing, consisting of a kind of abridged hieroglyphs. The number of these written characters is fewer than that of the hieroglyphs, the generic determinatives being more employed, and the vocalic complements of the consonants being constantly written, in order to distinguish similar forms. This writing was more extensively used than the hieroglyphic, being employed for state papers, legal documents, memoranda, accounts, religious books, rituals, and all the purposes of private and public life. Books were generally written in hieratic. It commences as early as the 4th or 5th dynasty, and terminates only about the 3d or 4th c. of our era. At the earliest period, it is occasionally written perpendicularly, but it was afterwards only written horizontally, and has generally portions in red ink, corresponding to our initial illuminated letters or rubrics. For the literary contents of these rolls, see Papyrus. Some, indeed, have supposed that the hieratic alphabet gave rise to the Phœnician, and have endeavoured to trace the Phœnician alphabet from hieratic sources. But although much ingenuity has been expended in this inquiry, the precise source of Phœnician writing

remains involved in obscurity, the principal fact being, that a syllabary existed long prior to the Phœnician alphabet, which did not reach the perfection of the Greeks, owing to the suppression of vowels. The second kind of hieroglyphic handwriting was the *demotic*, or so-called enchorial. It was a still further reduction of the hieratic, simpler forms being used, while the complements are not used, and it approaches still nearer the alphabetic system. It contains an alphabet of 42 letters, and a syllabary of 48 characters, and is less rich in the number of determinatives and ideographs than the hieratic. It is, like all cursive hands, more difficult to decipher than the hieratic. It was introduced into the Egyptian graphic system about the commencement of the 26th dynasty, or the 6th c. B.C., and continued in use till the 3d c. A.D. This was the last native form of writing in Egypt, the early Christians having introduced the Greek alphabet, with a few characters borrowed from the demotic. This script is rarely used for public monuments, although it appears on the Rosetta Stone; but it was universally employed for contracts, public documents, and occasionally for religious formulæ, owing to the decreasing knowledge of hieroglyphics. At the time of Clement, it was the first learned by beginners. With it the Greek language began to appear in public use.

Besides the Egyptian hieroglyphics, there are those of the Aztecs or Mexican, which were a kind of pure picture-writing, the names of monarchs, towns, and other things being painted by the objects which corresponded to their names. While in their historical writings the events themselves were portrayed, the number of the years of the reign of the king was indicated by placing in a line *en potence* in the picture the symbols of the years of the Aztec cycle, which were named after plants and animals. The Mexican hieroglyphs, in fact, consisted of conventional pictures, and they had no means of expressing grammatical form or any structural parts of a language. This mode of pure picture-writing prevailed not only in Mexico, but amongst the nations of Central America. The knowledge of these symbols has unfortunately been almost lost since the Spanish conquest, the meaning of only a few having been rescued from oblivion in the 16th c., when the greater part of the Aztec MSS. was destroyed by the Spanish ecclesiastics. It has indeed been asserted, that the monks used these symbols according to their *sounds*, to write the Lord's Prayer and other formulas; thus , a flag, pronounced

Pantti, was used for the syllable *Pa*; , a stone, *Tetl* for *tē*, the two expressing *Pater*; and a  cactus fruit, *Nochtli*, for *Noch*; and a stone  as above for *te*: these four groups expressing *Pate(r) Nochte*, or *Noster*; and so forth. This seems to shew the development of a phonetic system, but it was never extensively used, on account of the abhorrence entertained of the Aztec idolatry.—The term hieroglyphic was also used by the writers of emblemata or devices, symbolising Gnostic sentences taken from the Greek and Latin poets, and having no relation to Egyptian hieroglyphs.—In recent times, too, the astrological almanacs have had their symbolical representations and supposed prognostics of future events, which they called hieroglyphs.—Zoega, *De Origine Obeliscorum* (fo. Romæ, 1797); Young, *Archæologia* (1817, vol. xvii. p. 60); *Encyclop. Britannica* (1828); Champollion, *Lettre à M. Dacier* (Svo. Paris, 1822); *Lettre à M. Blacas* (Svo. Tur. 1826); *Précis du Système Hieroglyphique* (Svo. Paris, 1824); *Grammaire Égyptienne* (fo. Paris, 1841—1861); *Dictionnaire* (fo. Paris, 1841); Lepsius, in the *Ann. del' Instituto Arch.*

(Svo. Romæ, 1828); Birch, *Introduction to the Study of the Hieroglyphics* (12mo. Lond.); Brugsch, *Grammaire Démotique* (fo. Berl. 1855); De Rougé, *Étude d'une Stèle Égyptienne* (Svo. Paris, 1858); Chabas, *Papyrus Magique d'Harris* (4to. Chal. 1861).

HIERONYMITES, one of the many hermit orders (q.v.) established in the course of the 13th and 14th centuries. The Hieronymites grew out of the third order of St Francis. See FRANCISCANS. Some of the followers of Thomas of Siena, one of the Franciscan rigorists, having established themselves in various places among the wild districts which skirt the Sierra Morena, by degrees formed into a community, and obtained in 1374 the approval of Pope Gregory XI., who confirmed their rule, which was founded on that of St Augustine. The institute extended into other provinces of Spain, and also into Portugal; it was subsequently established in Italy, Tyrol, and Bavaria.

HIEROPHANT, or **MYSTAGOGUE**, the priest who presided over the mysteries at Eleusis, was always selected from the family of Eumolpus, who was regarded as their founder, and the first Hierophant. The H. was required to be a man of ripe years, without any physical defect, endowed with a fine voice, and of spotless character. He was forbidden to marry, but it is not improbable that married men were likewise appointed H., and were merely prohibited from forming a second marriage. In the mysteries, the H. represented the Demiurge or creator of the universe. He alone was authorised to preserve and explain the unwritten laws, to introduce candidates into the temple at Eleusis, and gradually initiate them into the lesser and greater mysteries. On this account, he was likewise styled *Mystagogue* and *prophet*, and no one was allowed to utter his name in the presence of an uninitiated person. At public solemnities he carried the image of the goddess, adorned with magnificent robes.

HIGH BAILIFF, is a term applied to some officers in England, who discharge ministerial duties, such as serving writs, &c., in certain liberties or franchises, exempt from the ordinary supervision of the sheriff. The term is used in contradistinction to the ordinary name of bailiff, which is now almost a term of reproach, and confined chiefly to the lowest class of officers, who execute writs against debtors.

HIGH COMMISSION COURT, a tyrannical court established by Queen Elizabeth to reform the church, abolished by 16 Ch. I. c. 11.

HIGH CONSTABLE. See CONSTABLE.

HIGH MISDEMEANOUR, an offence short of, but closely bordering on, treason.

HIGH PLACES (Heb. *Bamoth*), the name given in Scripture to certain places where illicit worship was performed by the people of Israel. The practice of erecting altars on elevated situations was common in ancient times, and originated in the belief that hilltops were nearer heaven, and, therefore, the most favourable places for prayer and incense. The fathers of the Jewish nation acted in this respect just like their neighbours. Abraham, we are told, built an altar to the Lord on a mountain near Bethel. The Mosaic law, however, true to its grand aim of securing national strength and purity by a vigorous system of isolation, prohibited the practice for the future, on the ground that the spots which the Israelites would be compelled to choose had been already polluted by idolatrous services. In spite of the vehemence with which the high places are again and again denounced in the Pentateuch, the prohibition seems to have been

a long time in producing the desired effect—if, indeed, it ever really accomplished it. During the whole eventful period of the Judges, it was not only practically obsolete, but we actually find that both Gideon and Manoah built altars on high places by Divine command (Judges, vi. 25, 26; xiii. 16–23). It also occasions much surprise to read of the violations of the injunction—among others by Samuel at Mizpeh and Bethlehem, by Saul at Gilgal, by David, by Elijah on Mount Carmel. The explanations given by the rabbis of these contradictions between the conduct of the prophets and kings of the Hebrew people, and the commands of their great lawgiver, are too absurd for mention. Whatever may be the true explanation, it is quite certain that worship in high places was almost universal in Judea, both during and after the time of Solomon. The results were such as might have been anticipated. The people erected altars not only to Jehovah but to Baal, and from worshipping in idolatrous places, proceeded to worship idols themselves. At a later period (see Books of Kings and Chronicles) a series of vigorous efforts was made by the more pious monarchs to suppress the practice, and after the time of Josiah, it seems to have been finally abandoned.

HIGH-PRIEST (Hebr. *Kohen haggadol*, or emphat. *Kohen*, Gr. *archiereus*, Lat. *primus pontifex*, &c.), the chief of the Jewish Priesthood. His dignity was hereditary in the line of Eleazar, the son of Aaron, and many more restrictions attached to it than belonged to the ordinary office of a Priest. He was only allowed to marry an intact virgin, and one of his own tribe; every impure contact even of the dead bodies of his own parents he was strictly forbidden, besides having to abstain from many other things that might cause any defilement whatever. His functions consisted principally in the general administration of the sanctuary and all that belonged to the sacred service. He alone was allowed to enter the Holy of Holies on the day of atonement, and to consult the Urim and Thummim (q.v.). No less was his costume of surpassing costliness and splendour, comprising numerous vestments in addition to those of the ordinary priests. This brilliant costume, however, was laid aside by the High-Priest when, on the day of atonement, he went to perform the most awful service in the Holy of Holies: a simple garb of white linen—the funeral dress of the Jews in later times—was all he wore on that occasion. The revenues of the High-Priest were in the main the same as those of the other priests; but, according to the Talmud, he was to be richer than these, and if his own means were insufficient, he was to be provided with opulent means by his brethren, in virtue of his exalted position; the other priests never addressed the High-Priest but by *Ishi Kohen Gadol*, 'My Lord High-Priest.' Before the Law, however, the High-Priest was equal to any other Israelite. It is doubtful at what time the office of *Sagan*, or vice-High-Priest, was created. The Talmud, moreover, speaks of a '*Mashiach Milhamah*,' 'Anointed for the war'; an officer who seems to have shared almost the dignity of the High-Priest, and whose special duty it appears to have been to read the proclamation prescribed in Deut. xx. 3, in the time of war, and who may have accompanied the troops for the purposes of celebrating the service in the camp. For further historical and theological points connected with this subject, see **PRIESTS**, **AARON**, and **JEWS**.

HIGH SEAS, i.e., the open sea, including the whole extent of sea so far as it is not the exclusive property of any particular country. The rule of

international law is, that every country bordering on the sea has the exclusive sovereignty over such sea to the extent of three miles from its shore; but all beyond, and which is not within three miles of some other country, is open or common to all countries. The part of sea within three miles' distance is generally called the territorial sea of the particular country, or *mare clausum*. The distinction has little effect on the right of navigation, but as regards fishing it is otherwise. Thus, for example, foreign fishermen have no right to fish within three miles of the British coast without a licence from the crown, or unless some special treaty—as, for example, the French and English treaty—has laid down other arrangements.

HIGH STEWARD, a judge now always a legal peer, who is specially appointed by the crown for the trial of peers indicted for treason or felony. He is a kind of speaker or chairman of the peers, and votes with the rest. It is one of the privileges of the British peerage to be tried by the court of the high steward.

HIGH TREASON. See **TREASON**.

HIGHGATE, a village of England, in the county of Middlesex, is situated in the suburbs of London, five miles north-north-west of St Paul's. It comprises many elegant villas, and some important benevolent institutions. On the slope of a hill below the church of H. is the North London Cemetery. The chapelry, or ecclesiastical district, has a pop. of 4502.

HIGHLAND REGIMENTS. The origin of the first of these regiments, the 42d, has been given under the head **BLACK WATCH** (q.v.). The valuable services of this regiment encouraged the government to augment the force; and accordingly seven other Highland regiments have been raised from time to time—viz., the 71st, in 1777; the 72d, or Duke of Albany's Own, in the same year; the 74th, in 1787; the 78th, or Ross-shire Buffs, in 1793; the 79th, or Cameron Highlanders, in 1805; the 92d, or Gordon Highlanders, in 1796; and the 93d, or Sutherland Highlanders, in 1800. The uniform of each of these corps is the Highland dress, including a distinctive tartan. The soldier wears a coat of scarlet, a kilt (in most, but not all, of the regiments), a plaid across the shoulders, a plume, and the other attributes of the Gaelic costume. In an army where officers are appointed by purchase, nationality is necessarily disregarded; but these corps are those to which Scotch gentlemen most frequently attach themselves, and about one-half the officers are Scotch. Of the men, about 79 per cent. are Scotch, 11 per cent. English, and 10 per cent. Irish. The regiments are recruited in the Highlands, the depôts being stationed (1862) at Stirling and Aberdeen.

HIGHLANDS, a term generally applied to the higher parts of a country, as, for example, Highlands of the Hudson, as defining a certain high and picturesque region on the river Hudson, in the state of New York; but the term has a more special application, to a particular district in Scotland. This district has no political or civil boundary. Separated by only a vague line of demarcation from the division called the Lowlands, the Scottish H. may be briefly described as that portion of the north and north-west of Scotland in which the Celtic language and manners have less or more lingered until modern times. The Highland line, as it is usually called, extends diagonally across the country from Nairn on the Moray Firth to Dumbarton on the Clyde; but the mountainous part of the counties of Banff, Moray, Aberdeen, Kincardine, and Perth are also understood to be

included in the designation Highlands. Caithness might be excluded as being a generally level country; but throughout the H. there are rich level tracts, none being more so than the eastern division of Ross-shire. The Hebrides (q. v.) or Western Isles are included in the H., but the isles of Orkney and Shetland, though to the north, are distinctly excluded, by reason of the Norwegian origin of the inhabitants.

The H. are full of lofty hills, some green and pastoral with tracts of heath, and others rugged and bare, varying in height from 1000 to 4000 feet, and having generally narrow valleys between, or else lakes and arms of the sea, called *lochs*. Besides the grander features, there are impetuous mountain torrents, picturesque ravines, and valleys or glens, in which, and on the sides of the hills, are seen the huts of the aborigines. Perhaps the most remarkable feature in the country is the line of valleys from Inverness to Fort-William, in which lies a series of navigable lochs, united by artificial channels to form the Caledonian Canal. Growing up under a system of clanship, the state of society in the H. was antiquated and unsatisfactory, in a national point of view; while the country was almost impenetrable to travellers, or to any species of traffic. The first great attempt to reform this state of affairs was the opening up of the country by roads in different directions, under the superintendence of General Wade, about 1725—1726. The next great act of melioration was the abolition of Heritable Jurisdictions (q. v.), including the ancient privileges of the heads of clans, about 1748. And lastly, not to speak of the planting of schools and churches, much was done by the establishment of the Highland and Agricultural Society in 1784. Since these events, the ancient patriarchal system has given place to improvements as regards communications, agriculture, dwellings, education, and other modern conditions, including a gradual substitution of English for the Gaelic language. Latterly, there has been a keen spirit of progress in the Highlands. Great numbers of the Celtic inhabitants, who had little chance of improving their circumstances on the spot, have been dispossessed, and their place taken by stock-farmers with capital from the Lowlands. See SUTHERLAND. While a new character has thus been given to extensive Highland pastures, the value of estates has been further and very remarkably advanced by being let for the pursuit of game to sportsmen, chiefly persons of rank and opulence from England. What, therefore, with improved farming and shootings, Highland estates have of late years risen immensely in value. Inverness is usually spoken of as the capital of the H., and is noticed under its proper head. The Highland counties are also noticed individually. There are sundry popular Guide-books for tourists in the H.; and for minute topographical and other details, we may refer to the *Guide to the Highlands and Islands of Scotland*, by G. and P. Anderson, Lond. 1834.

HIGHNESS, a title of honour given to princes. The titles 'Your Highness' and 'Your Grace' were both used in England in former times in addressing the Sovereign, but were supplanted by 'Your Majesty' towards the end of the reign of Henry VIII. The children of royal personages are addressed 'Your Royal Highness'; those of emperors, 'Your Imperial Highness.' The sultan of Turkey is addressed as 'Your Highness.'

HIGHWAY, in English law, is the place over which a right is enjoyed by the public, of walking, driving, or riding. It is often called the Queen's

highway; not because the Queen has any greater or better right than any of the public, but to denote the impartiality and equality with which all the subjects enjoy the right of way without distinction. Highways are distinguished into several kinds. 1. A footway, where the public have no right except to walk on foot; 2. A foot and horse way, where the public have the right of walking or riding on horseback; 3. A pack, and drift way—a way used for driving cattle and pack-horses; 4. A foot, horse, and cart way, where the public can walk or ride, or use vehicles of all ordinary descriptions. Navigable rivers are also called highways, but this is rather in a figurative sense. Where the right of way belongs not to the public generally, but to the owner of one or two houses and their tenants, this is called a private way, and is classed among easements.

It has often been disputed, and cannot be said to be yet thoroughly settled, whether a highway must be a thoroughfare—in other words, whether a road which does not lead to any public place can be a highway. The preponderance of authority seems rather to be in favour of the proposition, that it is essential that the highway be a thoroughfare. The mode in which a road is created is by dedication, or by grant of the owner, or by the necessity of things or act of parliament. Thus, if a person allow the public for four or five years to pass through his fields without stopping them, this will be evidence from which a jury may infer that the owner meant to make a present to the public of the right of way, and he cannot afterwards exclude the public, for the maxim holds, 'once a highway, always a highway.' The mode in which a grant of the way is proved, is generally by shewing that the public have, from time immemorial, or for at least forty years, or in some cases for twenty years, enjoyed the right of way; for if that is proved, then the law presumes that the right was given by some lost grant. There are also rights of way limited to a particular purpose, which may be proved by immemorial custom, as a way for the inhabitants of a village to or from the parish church. One of the incidents of a highway is, that if it is foundrous, or out of repair, the passenger is entitled to go over the adjacent land, whoever may be the owner of it, so as to avoid the foundrous part of the road. Another incident of the use of a highway is, that if any obstruction is placed upon it, whether in the nature of a gate, or a wall, or even if a house be built too near so as to encroach on the highway, any passenger has a right to abate the nuisance—i. e., he may himself, without any ceremony, remove the obstruction or demolish the wall, but he must take care not to do more damage than is necessary for the purpose of clearing the road, otherwise he will subject himself to an action. Another incident of the use of a highway is, that the public have an absolute right to use every part of it, and to pass to and fro in all directions. Of course, each must comply with certain well known rules, such as that of giving and taking the road, otherwise, if an accident were to occur, he would be liable for the negligence, if it arose from a neglect of such rules, for these constitute, as it were, the law of the road. It results from this principle, that no person, or body of persons, is entitled to convert part of the highway into any purpose, however useful, other than a highway. Thus in London, and other parts of the country, some vestries and surveyors lately presumed to give leave to a contractor to lay down a tramway in the streets, which was alleged to be a great public improvement; nevertheless, as it practically resulted in giving a monopoly to some persons, and moreover was an

obstruction to others, this was held to be a nuisance, and the parties who took part in it were indicted for the obstruction. And on the same principle, it has been held an indictable nuisance for an electric telegraph company to place their telegraph posts on the strips of land at the side of the road; for though it might be thought for the benefit of the public, instead of the reverse, yet as it practically obstructed the public in the free passage from every part of the highway to every other, it was held to be a nuisance. Nothing but an act of parliament can legalise such uses of a highway, and no person or body now existing has authority to restrict the free use of the Queen's highway in such a manner.

The soil of the highway, or rather the right to the ground beneath the highway, is presumed to be (not, as it is said to be in Scotland, in the crown, but) in the adjoining owners. Thus, if the land on both sides of a highway belong to the same owner, then the right to the ground beneath the road belongs to him also; and if the land on one side belongs to a different owner from the land on the other side, then each is presumed to have the right to the ground under the highway up to the middle line. This rule is more than a mere theory, for though neither of the adjoining owners can ever interfere with the passage of the public, who have an absolute right for ever to use it for every lawful purpose of transit, yet the adjoining owner has all the rights incidental to the property which do not interfere with this public right of passage. Thus, if a mine were discovered under the road, the adjoining owner would have the sole right to dig it and keep the contents; all that he would require to attend to would be, to leave sufficient support to the surface of the road. So, in like manner, where there are strips of land at the side of the road on which trees or grass grow, these belong solely to the adjoining owner, and the public have no right to their use. Another remarkable consequence follows, that if, for example, a gas company or a water company were to presume to take up the highway in order to lay their pipes under the surface, this is not only an indictable nuisance as regards the public, inasmuch as it obstructs the use of the road for the time being, but it subjects the company to an action of trespass at the suit of the adjacent owner, whose property consists of all that lies under the surface of the highway. Another consequence of the same rule is, that if a person is loitering on a highway, not with the intention of using it *qua* highway, but for the purpose of poaching at night, the courts have held that he may be punished under the night poaching act, for trespassing on the land of the adjoining owners in search of game.

The repair of a highway, in general, is a burden which falls upon the occupiers of the lands in the parish. Probably the reason is, that they use those highways most, and somebody or other must keep them in repair. Sometimes, however, the burden of repair now falls on the owner of the adjoining land, if it can be proved that he has always, from time immemorial, been in the habit of repairing, it being then presumed there was some good reason for this. The general rule is, however, that the inhabitants of the parish must repair the highways within the parish; and so indelible is this obligation, that no agreement they can enter into will relieve them of such a liability. But though bound to repair, they cannot be called on to widen the road. The common remedy, accordingly, when a road is out of repair, is to indict the parish, when, if guilty, the surveyor will be bound to make a rate, and pay the expenses.

Owing to the defects of the common law, which did not sufficiently give power to widen, shut up, and

improve highways, so as to keep pace with the wants of the time, a general act of parliament was passed in 1835, called the General Highway Act, 5 and 6 Will. IV. c. 50, which still regulates the subject. Many minute details are laid down by this act, but substantially the foregoing principles of the common law still govern the subject, the chief alterations being merely in the machinery by which these principles are carried out. The highways are kept in repair by a highway-rate, levied by the surveyor, a person annually appointed by the ratepayers in each parish, and who is vested with the control of the surface of the highway to a limited extent for the purpose of keeping it in due order; so that practically each parish manages its own highways—a state of things which the legislature has to some extent remedied by a statute of 1862, enabling the justices at Quarter Sessions to form several parishes into one district, and so enforce more uniformity in the management of the roads. Certain specific uses, or rather abuses, of the highway are also made more promptly punishable by the first statute, such as horsemen riding on footpaths, the tethering of cattle on the sides of the highway, playing at games, baiting bulls, lighting fires, firing off squibs, depositing materials, &c., on the highway.

When any party obstructs, or creates a nuisance on the highway, the proper remedy against him is to indict him for the nuisance; or if any individual has been specially injured by his misconduct, such individual may also bring an action against the party who caused the obstruction.

Many highways are called *turnpikes*, from the fact of their having toll-gates, bars, or turns across them, and are managed by commissioners or trustees. This is always done by some local act of parliament. Where a new road is considered to be of great public benefit, the neighbouring proprietors obtain an act of parliament to make it, with powers to take compulsorily the requisite land, and to raise money for the purpose of buying such land, as well as to keep up the road thereafter; and as a means of paying off all this expense, to erect a toll-gate, and levy a tax or toll on all who use the road. This is the history of all these turnpike-roads, the only way of paying the cost of making them being by levying this toll. Several general acts have also been passed to regulate the management of these turnpikes. Sometimes the soil of the turnpike-road is vested in these trustees. These turnpike-roads were violently opposed at first, the toll being unpopular, but they existed prior to the first general turnpike act, 13 Geo. III. c. 84. The present general turnpike act is 3 Geo. IV. c. 126, but other statutes have passed subsequently. In some cases, part of the highway-rate is ordered to be applied towards keeping up turnpikes, for the parish is bound to repair these roads as well as general highways. Several exemptions from paying toll are created in favour of farmers sending manure, hay, straw, &c., from one part of the farm to another, persons going to or from the parish church, or a funeral, or clergymen going to their church on duty, &c. So persons are exempt who do not pass above 100 yards along the road. All tolls chargeable must be stated in a table of tolls set up at the toll-house.

In the law of Scotland, highway is substantially the same, in most respects, as in England; but there are the following differences. It is generally laid down that the right to the soil of the highway is vested in the crown, and not in the adjoining owners, as in England. This theory, however, has been shaken by recent cases, and has been shewn to lead to some absurdities. Streets of burghs are said to be held by the magistrates, under the crown, for the public benefit. The general acts,

4 Geo. IV. c. 49, and 1 and 2 Will. IV. c. 43, and 3 and 4 Will. IV. c. 33, were passed for the regulation of highways, which impose various rules, in detail similar to the English highway and turnpike acts. Parish roads are maintained still on the old system of statute labour. Most of the roads are regulated by special acts of parliament, which are to be taken in conjunction with the general acts. When a public-road is obstructed in Scotland, the party is not indictable; but any one of the public may raise an action of declarator, and so establish the right of the public.

HIGHWAYMAN is not a technical legal term, the offence of robbing or assaulting on the highway being included under **LARCENY**, **ROBBERY**, or **ASSAULT** respectively.

HIGLER. See **HAWKERS**.

HILARY, St, Bishop of Poitiers, and doctor of the church, although by no means among the most voluminous of the Latin Fathers, yet, from the nature of the subjects on which he wrote, chiefly connected with the Arian controversy, occupies an important place in the patristic literature of the Western Church. He was born of pagan parents at Lemonum (Poitiers) in the early part of the 4th century. His conversion to Christianity was mainly the result of his own study of the prophecies, and did not take place till he was advanced in life. About the year 350 he was elected bishop of his native city, and immediately rose to the first place in the animated contest of parties in the Arian controversy. Having provoked the displeasure of the court party, he was imprisoned, and sent into exile in Phrygia; but he appears again in the council of Seleucia in 359, and soon afterwards was permitted to resume possession of his see, where he died, 367. The church holds his day on the 13th January. His most important work is that on the Trinity, but his three addresses to the Emperor Constantius, by their vehemence, and by the boldness of their language, have most attracted the notice of critics. H.'s theological writings are especially valuable for the history of the Arian party, and particularly for the doctrinal variations of that sect, and the successive phases through which it passed between the council of Nice and the first council of Constantinople. The best edition of the works of St H. is that of the Benedictine Dom. Constant (Paris, 1693), or the reprint of it with additional matter by Maffei (Verona, 1730).—There is a second bishop of the same name who occupies a conspicuous place in the history of the 5th c., **HILARY OF ARLES**, born in 401, educated at the celebrated monastic school of Lerins, and made bishop of his native city in 429. As metropolitan of Arles, he presided at several synods, and especially at Orange in 441, the proceedings of which involved him in a serious controversy with the pope, Leo the Great. A deposed bishop, named Chelidonius, having carried an appeal to Rome, a council was summoned by Pope Leo, at which H. was present, and in which the condemnation of Chelidonius, as well as that of another bishop, Projectus, was reversed. H., however, refused to submit to the decision, and soon afterwards quitted Rome—a proceeding which drew upon himself a very severe animadversion. He did not question the authority in itself, but he maintained that it was uncanonically exercised. In the end, however, he sought a reconciliation with Pope Leo, and the dispute was brought to an amicable termination. H. died in his 48th year at Arles in 449.

HILARY TERM, one of the English legal terms during which the courts of law sit at Westminster

in banc. The term is appointed by statute to commence on the 11th and to end on 31st January. The name is said to be borrowed from St Hilary, Bishop of Poitiers.

HILDEBRAND. See **GREGORY VII**.

HILDESHEIM, an old town of Hanover, capital of the principality of the same name, is situated on the river Innerste, in a pleasant valley surrounded by hills, 24 miles south-east of Hanover. It is a very quiet town, with very old houses, the upper stories of which are furnished with balconies. It has been a bishop's seat since 822, and its cathedral, dating from the beginning of the 11th c., has bronze gates (date, 1015) 16 feet high, and covered with bas-reliefs. There are also in the cathedral beautiful paintings on glass, and many art and other treasures. The church of St Godehard, considered a master-piece of architecture, dates from 1133 (restored in 1852), and is surmounted with three pyramidal towers. St Michael's Church, nearly an unaltered basilica, dates from 1022 and 1186. It has no manufactures; the inhabitants being employed chiefly in the professions, and in the active trade in corn, yarn, and linen. Agriculture flourishes abundantly in the vicinity. Pop. 16,300.

HILL, **SIR ROWLAND**, K.C.B., post-office reformer, was born at Kidderminster, December 3, 1795. His father conducted a school near Birmingham, which was celebrated in connection with the 'Hazelwood system of education' (afterwards removed to Bruce Castle, Tottenham), and in which H. was engaged as a teacher until the year 1833. He there joined an association which obtained an act for establishing the colony of South Australia, with the design of reducing to practice Mr Gibbon Wakefield's scheme of colonisation. H. became secretary to the Royal Commissioners, who at first managed the affairs of South Australia. He was also a member of the committee of the Society for the Diffusion of Useful Knowledge. The high rate of postage had for many years engaged his attention, and in 1837 he published a pamphlet recommending a low and uniform rate of postage throughout the British Isles. Petitions were poured into the House of Commons in favour of H.'s plan, and in 1837 the House appointed a committee to investigate the merits of penny-postage. In 1840, the principle of a uniform rate of postage was adopted, and an experimental charge of 4d. per letter was levied. This was shortly afterwards followed by the present uniform penny-rate. H. was placed in the treasury, and was working out his measure when the Tory government succeeded to power, and dismissed him. A subscription was got up at once to reward a public benefactor, and mark the public sense of his dismissal, and the sum of £15,000 was presented to Hill. In 1846, when the Whigs returned to office, H. was appointed secretary to the Post-master General. In 1854, he succeeded Colonel Maberley as secretary to the Post-office, an appointment which he still (1862) holds. In 1860, he was made K.C.B., avowedly as a recognition of his great public services. The vast and rapid development of the postal system under the penny-postage is more fully described elsewhere (**POST-OFFICE**). The Money-order Office is one of the offshoots of penny-postage, and parliament, in the session of 1861, engrafted a system of Post-office Savings-banks upon the postal-service, which has been carried out by H. with his usual administrative ability and success.—His eldest brother, **MATTHEW DAVENPORT HILL**, the recorder of Birmingham, has distinguished himself by his labours for the education of the people, and the reformation of criminals. One of his brothers, **Mr EDWIN HILL**, is the

inspector of stamps at Somerset House; and another, Mr FREDERIC HILL, was the first to propound and enforce those humane principles upon which modern prison discipline is founded; and his work, *On Crime*, is a standard authority for legislators. He is now (1862) assistant-secretary to the Post-office.

HILL, VISCOUNT (ROWLAND HILL), British general and commander-in-chief, a scion of the ancient and distinguished family of the Hills of Shropshire, was second son of Sir John Hill, Bart., of Hawkstone. He was born August 11, 1772, entered the army at the age of fifteen, and obtained a captaincy before he was twenty. He took part in the disastrous campaign in which Sir John Moore lost his life. He also served in the campaigns of 1809, 1810, and 1811, under the Duke of Wellington, and displayed conspicuous gallantry, as well as great talents as a commander. In the Peninsular engagements, he was usually intrusted with the most important duties next to those which devolved upon the Duke of Wellington; and when the army returned home, the fame of H. was second only to that of the great commander. He was created Baron Hill of Almaraz and Hawkstone, received a parliamentary grant of £2000 a year; and both title and annuity were granted to his nephew in remainder. He was also made G.C.B. He commanded a division at Waterloo, and remained with the army of occupation, as second in command, until it evacuated the French territory. He succeeded the Duke of Wellington in 1828 as commander-in-chief of the army, and dispensed the patronage which he possessed with great impartiality. In 1842, his health declined, and the Duke of Wellington once more took the command of the army. After his resignation, H. was created a viscount. He died unmarried at Hardwicke Grange, county of Salop, December 10, 1842, in his seventy-first year. He was succeeded in his titles and estates by his nephew, Sir R. Hill, Bart.

HILL MUSTARD. See BUNIAS.

HILL STATES, a number of small principalities of India on the left or east side of the Upper Sutlej, comprise about 10,000 square miles, and about 550,000 inhabitants. With the exception of this aggregate name, they have but little in common with each other. Perhaps twenty may be reckoned which have a distinct existence—those best known being Bhagul, Bussahir, and Gurwhal.

H'LLAH, or HILLA, a town of Turkey in Asia, in the pashalic of Bagdad, and 60 miles south of the city of that name, is situated on both banks of the Euphrates, and is built on the ruins of ancient Babylon (q. v.). Here the Euphrates is 450 feet in width, and is crossed by a floating bridge. H. is a fortified town, contains a citadel, a mosque, and several well-stocked bazaars. Dyeing, tanning, and manufactures of silk are here carried on. The population, which is fluctuating, may be stated at between 7000 and 10,000.

H'LLEL, HABABLI (the Babylonian), or HAZAKEN (the Elder), one of the most eminent and influential doctors of the Jewish law, was born about 112 B. C. in Babylonia, of poor parents, but in the female line of royal (Davidian) descent. Forty years old—so the legend runs—he migrated into Palestine for the sake of studying the law; and of the small sum he earned by hard manual labour, he gave half to the door-keeper of the academy, where Shemaja and Abtalion, the great masters of the period, expounded the Halacha (q. v.); and before long, he became one of the favourite and foremost pupils of Abtalion. Five or six years (Sabb. 15 a.) after Herod had mounted the throne,

H. was elected Nasi, or president of the sanhedrim. The range of his acquirements is said to have been immense; embracing not only Scripture and tradition, but nearly all branches of human and 'superhuman' knowledge. Yet he was one of the meekest, most modest, kind, and simple-hearted men. 'Be of the pupils of Aaron, a friend of peace, a promoter of peace, loving mankind, and bringing them nearer to the Divine law' (Aboth, i. 2). 'Do not confide in thyself, until the day of thy death' (Aboth, ii. 3). 'Do not judge thy neighbour, until thou hast been in his place thyself' (Aboth, ii. 5). Such were some of his most favourite sayings. Still more characteristic, and highly curious, if compared with Matt. vii. 12, is the answer he gave to a heathen who, in a spirit of mockery, requested him to teach him 'all the law of Moses' while he could stand on one leg. 'Do not unto others as thou wouldst not have others do unto thee,' H. replied; 'that is all the law; the rest is mere comment' (Babyl. Talm. Shabb. 31 a.). H. was also the first who collected the numberless traditions of the oral law, and arranged them under six heads (see MISHNA). The often alluded to and highly exaggerated dispute between H. and his school and Shammai (q. v.), the contemporaneous supreme judge of the Sanhedrim (*Ab-Beth-Din*), and his school, resolves itself into a mere theoretical one: the decisions themselves are, with a very few and unimportant exceptions, identical. H., however, was the more popular of the two, and the majority was, on account of the better authorities he was able to quote in his support, generally on his side.

The time of H.'s death is uncertain. He is said to have lived, like Moses, 120 years: 40 years in ignorance of the Law, 40 years as the humblest pupil of the Law, and 40 years as the highest master of the Law. A verse of the dirge composed at his death has survived: 'Woe for the pious, the modest, the disciple of Ezra' (Sanh. 11 a.). For the further influence of his house and school, see GAMALIEL and TALMUD.

HILTED, a term used in Heraldry, to indicate the tincture of the handle of a sword.

HIMĀLAYA ('the abode of snow,' from the Sanscrit, *hima*, snow, and *ālaya*, abode), in south central Asia, is the most elevated and stupendous mountain system on the globe. It is not, as sometimes represented, a single chain, but a range of rugged snowy peaks depending from the high table-land of Tibet, and separated by deep gorges, the outlets of the streams originating in the melted snow and ice of the interior. The mass of the H. proper extends from the great bend of the Indus in the west, to the junction of the Sanpu with the Brahmaputra in the east, or from long. 73° 23' to 95° 40' E., a distance of nearly 1500 miles, following the curve from south-east to north-west. The mean elevation of the range is from 16,000 to 18,000 feet, but 45 of its peaks are now known to exceed 23,000 feet in height. Of these there are, in Kumaon, Nanda Devi, 25,749 feet; in Nepaul, Dhawalagiri, 26,826 feet; Mount Everest, 29,002 (the highest known point on the globe); and Kunchinjinga, 28,156 feet; in Bhotan, Chumalari is 23,946 feet above the sea. The southern surface of the H. comprises three distinct regions—first, adjoining the plains of Hindustan, the *Tarai*, a grass-covered marshy plain; next, the great belt of *Saul Wood*, stretching along a great part of the range; and beyond it the *Dhuns*, a belt of detritus, extending to the foot of the true mountains.

Above these regions, which are extremely unhealthy, are placed the Sanitaria for troops—

Darjeeling, Sinla, Muree. There are no plains and but few lakes in the H.; the chief of the latter are Nainital, in Kumaon, 6520 feet, and the lake of Cashmir, 5126 feet above the sea.

Snow falls at rare intervals in the mountains as low as 2500 feet, but at 6000 feet it snows regularly every winter. The limit of perennial snow in the H. is 16,200 feet on the south, and 17,400 feet on the north side; an anomaly probably owing to the dry atmosphere of Tibet, and the small quantity of rain and snow that falls there. The high range of the H. forms a vast screen which intercepts and condenses nearly all the moisture carried by the winds from the Indian Ocean, and deposits it on the southern face of the mountains; hence at Chirra Punji, 4200 feet above the sea, as much as 600 inches of rain has been known to fall in one year. Glaciers are found in every part of the range above the snow line, one of these, that of Deotal in Gurhwal, is 17,945 feet above the sea. The mean height of the passes in the H. is 17,800 feet, the highest known is Ibi-Gamin Pass into Gurhwal, 20,457 feet, and the highest used for traffic is the Parang Pass in Spiti, 18,500 feet above the sea. All the passes above 16,000 feet are closed with snow from November till May. Trees and cultivated grains attain their highest limits in the mountains at 11,800 and shrubs at 15,200 feet above the sea. The tea-plant can be cultivated along the entire southern face of the H. to an elevation of 5000 feet, but the best is produced at from 2000 to 3000 feet above the sea. Tigers and apes are found at an elevation of 11,000, and the leopard at 13,000 feet, while the dog follows the herds over passes 18,000 feet high. Snakes are found at an elevation of 15,000 feet, but the highest limit of the mosquito is 8000 feet above the sea. The geological structure of the Himalayas consists of crystalline rocks, with granite, gneiss, and a schistose formation, comprising micaceous, chloritic, and talcose schists. Earthquakes are of frequent occurrence in the central range. About the meridian of 82° E., near the Mansarowar Lake, a great transverse range, which further north is called the Giang-ri mountains, abuts against the H. from Tibet. This ridge forms the watershed between the Sanpu (afterwards the Brahmaputra) on the east, and the Indus and Ganges on the west. These vast river systems, with their magnificent tributaries, derive their chief supplies from the melting of the snows in the Himalays, and consequently are in flood at the hottest season of the year when the moisture they supply is most needed.

On account of the majestic height of this mountain-range, and the apparent impossibility of reaching its summit, the imagination of the ancient Hindus invested it with the most mysterious properties, and connected it with the history of some of their deities. In the Purāṇas, the H. is placed to the south of the fabulous mountain Meru, which stands in the centre of the world (see MERU), and described as the king of the mountains, who was inaugurated as such when Prithu was installed in the government of the earth. As the abode of Siva, he is the goal of penitent pilgrims, who repair to his summit in order to win the favours of this terrific god. His wife was Menā, whom the Pitris or demigods Vairājas engendered by the mere power of their thought.

HINCKLEY, a manufacturing and market town of England, in the county of Leicester, 13 miles south-west of the town of that name, and 99 miles north-north-west of London. Its parish church, with a beautiful old oak roof, is supposed to have been erected during the reign of Edward III. H. has manufactures of cotton hosiery. Pop. (1861) 6448.

HINCMAR, a celebrated churchman of the 9th c., was born in 806. The exact place of his birth is unknown, but from his being of the family of the Counts of Toulouse, it is presumed to have been in that province. He was educated in the monastery of St Denis, and, with the sanction of the council of Paris (829), he was intrusted with the framing and carrying out a plan for the reformation of the monastery. Some time afterwards, he was named abbot of the abbeys of Compiègne and St Germain; and in 845 was elected Archbishop of Rheims. The most important event, considered historically, in the career of H., is his controversy with Pope Nicholas I. in the year 862 (see NICHOLAS I.). Rothadius, Bishop of Soissons, and suffragan of H., deposed a priest of his diocese, who appealed to H. as metropolitan, and was ordered by him to be restored to office. Rothadius resisting this order, and having been, in consequence, condemned and excommunicated by the archbishop, appealed to the pope, who at once ordered H. to restore Rothadius, or to appear at Rome in person or by his representative, to vindicate the sentence. H. sent a legate to Rome, but refused to restore the deposed bishop; whereupon Nicholas annulled the sentence, and required that the cause should again be heard in Rome. H., after some demur, was forced to acquiesce. The cause of Rothadius was re-examined, and he was acquitted, and restored to his see.

The conduct of H. is also historically interesting in relation to the temporal power of the medieval papacy (see PAPACY). Under the successor of Nicholas, Adrian II., a question arose as to the succession to the sovereignty of Lorraine on the death of King Lothaire, the pope favouring the pretensions of the Emperor Lewis in opposition to those of Charles the Bold of France. To the mandate which Adrian addressed to the subjects of Charles and to the nobles of Lorraine, accompanied by a menace of the censures of the church, H. offered a firm and persistent opposition. He was equally firm in resisting the undue extension of the royal prerogative in ecclesiastical affairs. When the Emperor Lewis III., in opposition to the solemn judgment of the council of Vienne, sought to obtrude an unworthy favourite, Oacer, upon the see of Beauvais, H. boldly remonstrated, and fearlessly denounced the unjustifiable usurpation. H. died in the year 882. His works were collected in two vols. folio by Père Sirmond, S. J. (Paris, 1645). Several other pieces of his are found in the 8th vol. of Labbe's *Collection of Councils*, and in the 5th vol. of that of Hardouin; as also in Père Cellot's *Concil. Duziac*. (Paris, 1658). Many others of his works, still in MS., are enumerated in Wetzer's *Kirchen-Lexicon*, v. 308.

HIND, the female of the Stag (q. v.) or Red Deer. The term is also sometimes used to designate the female of some other species of deer—never being so applied, however, to any other British or European species; and is sometimes even extended to female antelopes. In the strictest use of the term hind, according to the ancient laws and customs of 'venerie,' it did not become the designation of a female red deer until the third year of its age.

HIND, JOHN RUSSELL, an English astronomer, was born at Nottingham, May 12, 1823. At an early period he became an enthusiast in the study of astronomy, and in 1840 obtained, through the influence of Professor Wheatstone, a situation in the Royal Observatory at Greenwich, where he remained till June 1844. H. was then sent as one of the commission appointed to determine the exact longitude of Valentia, and on his return was appointed to a

post in Mr Bishop's Observatory, Regent's Park, London. Here he made those observations, the results of which have rendered his name renowned in the scientific world. He has calculated the orbits and declination of more than seventy planets and comets, noted sixteen new movable stars, and three nebulae, and discovered ten new planets, viz., Iris and Flora in 1847, Victoria in 1850, Irene in 1851, Melpomene, Fortuna, Calliope, and Thalia in 1852, Euterpe in 1853, and Urania in 1854. In 1851, H. obtained from the Academy of Sciences, Paris, the Lalande Medal, and was elected a corresponding member. In 1852, he obtained the Astronomical Society of London's gold medal, and a pension of £200 a year from the British government. He also superintends the publication of the *Nautical Almanac*. H.'s scientific papers have generally been published in the *Transactions of the Astronomical Society*, in the *Comptes Rendus* of Paris, and the *Astronomische Nachrichten* of Altona. H.'s popular works are—*Recent Comets and the Elements of their Orbits* (published in the *Athenæum*, August 9, 1845); *Astronomical Vocabulary* (16mo, 1852); *The Comets* (12mo, 1852); *The Solar System* (8vo, 1852); *Illustrated London Astronomy* (8vo, 1853). *Elements of Algebra* (Lond. 1855), &c. These works, though cheap, are all valuable and entertaining.

HINDU KUSH, or **INDIAN CAUCASUS**, forms the westward continuation of the Himalaya, being sometimes reckoned a part of that colossal range. It extends from the Upper Indus on the E. to the Bamian Pass (q. v.) on the W., stretching in N. lat. between 34° and 36°, and in E. long. between 68° and 75°. Separating Afghanistan on the S. from Turkestan on the N., it sends off the Oxus through the latter, and the Helmund through the former, to two salt lakes—the Oxus to Aral, and the Helmund to Hamûn. The loftiest summit is Hindu Koh, situated about 80 miles to the north of the city of Cabul, and estimated to be more than 20,000 feet above the sea. Unlike the Himalaya Proper, the chain is a water-shed, and is also remarkably destitute of timber; while, like the ridge in question, it presents an appearance of much greater height towards the south than towards the north.

HINDU LAW, RELIGION, &c. See **INDIA**.

HINDUSTAN, meaning *The Land of the Hindus*, is a term of the same class as Turkestan, Afghanistan, Farsistan, Beloochistan, or Frangistan (the oriental name of Western Europe). See **INDIA**.

HINGE, the pivots or joints on which doors, shutters, &c. revolve. The simplest form of hinge is a projection cut upon the substance of which the door is made, and fitted into a hole. This is sometimes done with wooden shutters, and there are examples extant of *stone shutters* hinged in this manner. The cathedral of *Torcello*, near Venice, which dates from the 11th c., still has the windows protected with shutters formed of large slabs of stone, hinged on stone pivots. During the middle ages, hinges, as well as every other useful article, were made subjects of ornamentation. The earliest ornamental hinges date from about the 10th century. The first examples are cramped and stiff, and the scrolls are frequently terminated with animals' heads. In the early English and decorated styles, the hinges and other metal-work were very elaborate and beautiful in design, and frequently extended over the whole of the doors. In the perpendicular style, hinges were usually very simple in form, the panelling of the wood-work not admitting of much ornamental iron-work. In modern times, hinges have almost entirely lost their ornamental character. They are chiefly made of brass and iron, and fitted on the edges of the doors and shutters, where they

are concealed. 'Double-jointed edge-hinges' are those now most in use. The revival of mediæval architecture has, however, given an impulse to the

Hinge (copied from Parker's *Glossary of Architecture*):
1, Compton, Berks; 2, Laon cathedral.

manufacture of ornamental metal-work, and hinges of varied and good design are now generally used in connection with Gothic architecture.

HINNOM, VALLEY OF. See **GEHENNA**.

HINNY, the hybrid produced between a horse and a female ass. It is smaller than a mule, but the body is more bulky in proportion to the legs, and its strength is inferior. It is less valuable than the mule, although it is more docile. The hinny is rare. It was described by some of the earlier naturalists as a hybrid between the ox and the ass, and even Buffon seems to have entertained this notion.

HINOJOSA-DEL-DUQUE, a town of Spain, in the province of Cordova, and 45 miles north-west of the city of that name, consists of spacious streets, with neat white-washed houses, each with a garden or court attached. It has several convents and hospitals, and linen and woollen manufactures. Pop. between 7000 and 8000.

HIOUEN-THSANG, a celebrated Chinese traveller, professing the Buddhist creed, who visited 110 countries and places of India in the first half of the 7th c. (629–645), and gave a very detailed and interesting account of the condition of Buddhism as it prevailed at that period in India. His inquiries having been chiefly devoted to the objects of his veneration, he did not enter so much into details concerning the social and political condition of India as might be desired; but considering the many curious notices he gives on other matters which, besides those of Buddhist interest, came under his observation, and the high degree of trustworthiness which his narrative possesses, his memoirs must be looked upon as one of the most important works on the history of India in general, and of Buddhism in particular, during the period stated. Apparently, he travelled alone, or with a few occasional companions; and wearing the garb of a religious mendicant, with nothing but a staff, wallet, and waterpot, he does not seem to have been exposed to any dangerous adventures on his journey from China to India. It is more remarkable, however, that he incurred no impediment on his way home, when he travelled with 500 packages of books, besides images of Buddha and various sacred relics; and his immunity from danger affords a remarkable proof of the civilised condition of the countries which he described. It does not appear

that the account of his travels was written by himself, for of the two works relating to them neither is the performance of Hiouen-Thsang. The first is a bibliographical notice of him, in which his travels form a principal feature; it was composed by two of his pupils, Hœi-li and Yen-Thsong. The latter bears the title of *Ta-thang-si-yu-ki*, or 'Memoirs of the Countries of the West, published under the Thang,' and was edited by Pien-ki, since H. himself, who during 17 years had spoken none but foreign languages, had perhaps lost the facility of writing elegant Chinese. According to a remark added to the title of his work in the imperial Chinese edition, it would follow that it had been translated from Sanscrit into Chinese; but this statement, as Professor Stanislas Julien observes, can only mean that the fundamental part of the work relating to history, legends, &c., was taken from Hindu sources, since it is obvious that the indication of distances and numerous personal observations must have come from H. himself. Both works have been published in a French translation by the distinguished Chinese scholar, M. Stanislas Julien, who has acquitted himself of the great and peculiar difficulties of his task in so creditable a manner, that his *Histoire de la Vie de Hiouen-Thsang* (Paris, 1853), and his *Mémoires sur les Contrées Occidentales, par Hiouen-Thsang* (2 vols. Paris, 1857—1858), have not only become indispensable to the student of Chinese and Sanscrit literature, but will be a lasting honour to M. Julien's industry and scholarship. An abstract of both works, by the late Professor H. H. Wilson, appeared in the 17th volume of the *Journal of the Royal Asiatic Society*, pp. 106—137.

HIP, or **HEP**, the fruit of the rose. It is almost always red, and consists of the enlarged fleshy tube of the calyx filled with hard seed-like *achænia*, which are surrounded with bristly hairs (*setæ*). The fleshy covering contains mucilage, sugar, gum, malic and citric acids, tannin, resin, and a number of salts. The *setæ* excite itching in the skin. The fleshy part of hips, beaten to a pulp, and preserved with sugar, finds a place in the pharmacopœia,

Hip (*Rosa Canina*):

a, hip opened, shewing position of seeds; b, a seed.

under the name of Conserve of Hips (*Conserve Rosa Fructus, Confectio Rosa Canina*, &c.). It is slightly refrigerant and astringent, and is often used as a vehicle or basis for other medicines. Hips eaten entire are a popular remedy for ascarides, on which their action is purely mechanical, and is owing to

the irritating *setæ*. The hips of different species of rose are almost indiscriminately used. In some parts of Europe, hips are preserved in sugar as an article of food, or are dried and used in soups and stews, the *achænia* and *setæ* being removed. For this purpose, the large soft hips of the Apple Rose (*Rosa pomifera*) are preferred.

HIP, in Architecture, the rafter at the angle where two sloping roofs meet. A roof is called a *hipped roof* when the end is sloped upwards so as to form a hip on each side (see fig.).

HIP-JOINT, is a ball-and-socket joint formed by the reception of the globular head of the thigh-bone (or femur) into the deep pit or cup in the *os innominatum*, which is known as the *acetabulum* (so called from its resemblance to the vinegar cups used by the Romans). If the variety of the movements of this joint—viz., flexion, extension, abduction, adduction, and rotation inwards and outwards, and at the same time its great strength are considered, it may well claim to be regarded as the most perfect joint in the whole body.

The reader will form a tolerably clear conception of the relative forms of the acetabulum and the head of the thigh-bone from a glance at the figure, in which the surrounding parts are cut away, and

Hip-joint:

1, 2, 3, pelvic ligaments; 4, 5, the greater and lesser sacro-sciatic foramina; 6, the cotyloid ligament; 7, the round ligament; 8, the cut edge of the lower part of the capsular ligament.

the thigh-bone is drawn out of its socket. The ligaments are usually described as five in number—viz.: 1. The capsular; 2. The ilio-femoral; 3. The *teres* or round; 4. The cotyloid; and 5. The transverse. Of these, the capsular ligament, supposed to be removed in the figure, is the most important, and extends from the edge of the cup to the circumference of the neck upon which the ball is carried, enclosing the bony parts in a strong sheath. The ilio-femoral is merely an accessory band of fibres which give increased thickness to the capsular ligament in front, where strength is specially required. The great use of the capsular ligament is to limit the extension of the hip-joint, and thus to give steadiness to the erect posture. The only other ligament requiring notice is the *L. teres*, or round ligament, which is in reality triangular rather than round, and has its apex attached to the head

of the thigh-bone, while its base is connected with the cavity of the acetabulum. Its use is not very clearly known, but probably is to limit movement in one direction. It is sometimes absent in cases in which no special weakness of the joint was observed during life, and is of by no means constant occurrence in mammals. The joint is much strengthened by a large number of surrounding muscles, some of which are of considerable power.

In such a joint as this, although the ligaments materially assist in preventing dislocation, it is obvious that the articular surfaces cannot, under ordinary circumstances, be kept in apposition by them, inasmuch as they must be loose in their whole circumference, to permit of the general movements of the joint. The experiments of Weber shew that atmospheric pressure is the real power by which the head of the femur is retained in the acetabulum when the muscles are at rest. 'One convincing experiment is easily repeated—that, namely, of holding up a side of the pelvis, with its appended lower extremity, the joint not having been opened, and then boring a hole through the acetabulum, so as to admit air into the joint, when the weight of the limb will cause it to drop from half an inch to an inch, the head of the thigh-bone being pulled out of the acetabulum as soon as the air is permitted to pass between the articular surfaces.'

—Humphry *On the Human Skeleton*, p. 74.

DISEASE OF THE HIP-JOINT. Hip-disease differs in so many points of importance from other joint-diseases, and is so serious an affection, that it requires a special notice. Its connection with scrofula is more distinctly marked than that of most other joint-diseases, and it almost always occurs before the age of puberty. It comes on, in children or young persons of a scrofulous constitution, from very slight causes; thus, it is often traced to over-exertion in a long walk, a sprain in jumping, or a fall; and in many cases no apparent cause can be assigned.

In the early stage of the disease, the whole of the structures of the joint are inflamed, and by proper treatment at this period, the morbid action may be sometimes subdued without any worse consequences than a more or less rigid joint. Usually, however, abscesses form around the joint, and often communicate with its interior; and the acetabulum, and the head and neck of the thigh-bone, become disintegrated, softened, and gritty. In a still more advanced stage, dislocation of the head of the thigh-bone commonly occurs, either from the capsular ligament becoming more or less destroyed, and the head of the bone being drawn out of its cavity by the action of the surrounding muscles, or from a fungous mass sprouting up from the bottom of the cavity, and pushing the head of the bone before it.

It is of extreme importance that the symptoms should be detected in an early stage of the disease; and on the least suspicion of this joint being affected, surgical aid should at once be sought.

As the disease advances, abscesses (as already mentioned) occur around the joint, which sometimes, from the tension they exert on the obturator nerve, occasion extreme pain in the inside of the thigh. True shortening of the limb now takes place, which at the same time becomes adducted and inverted. From this stage, if the health is pretty good, and the lungs are sound, the patient may be so fortunate as to recover with an ankylosed (or immovable) hip-joint; but the probability is that exhaustion and hectic will come on, and that death will supervene, from the wasting influence of the purulent discharges occasioned by the diseased bone.

The duration of the disease may vary from two or three months to ten or more years.

As the treatment must be left entirely in the hands of the surgeon, it is unnecessary to say more than that the most important points are *perfect rest* to the affected part, which may be secured by a strong leather splint, or by a starch bandage, the internal administration of cod-liver oil and tonics, and the application of counter-irritation by means of an issue behind the great trochanter.

HIP-KNOB, an ornament carved in stone or wood, set on the apex of a gable or hipped roof, and forming a kind of Finial (q. v.).

HIPPARCHUS, the first systematic astronomer on record, was born, according to Strabo, at Nicea, in Bithynia, about the beginning of the 2d c. B. C. Of his personal history, nothing is known. According to Fabricius, H. wrote nine separate works, of which only the last and least important, *A Commentary on Aratus*, has come down to us. The other works treated of astronomy and geography. The only authority we have regarding the discoveries made by H. is the *Syntaxis* of Ptolemy, and from it we learn that H. discovered the 'precession of the equinoxes,' determined the place of the equinox among the stars, established the solar and lunar theories, invented the Astrolabe (q. v.), and drew up a catalogue of upwards of 1000 stars, determining the longitude and latitude of each. As Ptolemy was also an astronomer, there is some difficulty in allotting to each his meed of praise for the discoveries mentioned in the *Syntaxis*, which difficulty has given rise to much discussion, resulting in favour of the claims of Hipparchus. See Delambre's *Histoire de l'Astronomie Ancienne* (Paris, 1817).

HIPPOBOSCIDÆ. See FOREST FLY and SPIDER FLY.

HIPPOCAM'PUS, a genus of Osseous Fishes, of the order *Lophobranchii* (q. v.), and of the family *Syngnathidæ* (see PIPE-FISH), by some naturalists made the type of a separate family, *Hippocampidæ*, remarkably distinguished by the prehensile tail, which is tapering, and quite destitute of fin. The

Hippocampus Brevirostris.

species, which are not very numerous, but some of which are found in the seas of all parts of the world, are fishes of very extraordinary form and habits. They have the jaws united and tubular, as in the pipe-fishes; the body compressed, short, and deep; the whole length of the body and tail divided by longitudinal and transverse ridges, with tubercles at their intersections. The scales are ganoid, clothing the whole body in a kind of armour. The males have pouches on the tail, in

which the eggs are carried till they are hatched. From their appearance, these fishes have received the name of SEA-HORSE. They swim in a vertical position, and are always ready to entwine their tails around sea-weeds, or even with one another. They are very interesting objects in an aquarium. One species, *H. brevisstris*, is occasionally found on the shores of Britain, particularly in the south.—H. in the Grecian mythology was a sea-horse—half fish, half horse—which served Poseidon (Neptune).

HIPPOCRAS, an aromatic medicated wine, formerly much used in this country, and still employed on some parts of the continent. The following was the method of preparing it: Twelve pints of Lisbon were mixed with an equal quantity of Canary wine. Bruised spices of various kinds were digested in the wine for three or four days, after which it was strained, and two pounds and a half of lump-sugar were added. It was doubtless an admirable cordial.

HIPPOCRATES, the most celebrated physician of antiquity, was the son of Heracleides, who was also a physician, and belonged to the family of the Asclepiadae, the subject of the present notice being either the 19th or the 17th in descent from Æsculapius. His mother's name was Phænarete, who was said to be descended from Hercules. He was born in the island of Cos, probably about the year 460 B.C. He is said to have been instructed in medicine by his father and by Herodicus, and in philosophy by Gorgias of Leontini, the celebrated sophist, and Democritus of Abdera, whose cure, when affected by madness, he afterwards effected. After spending some time in travelling through different parts of Greece, he settled and practised his profession at Cos, and finally died at Larissa, in Thessaly. His age at the time of his death is uncertain, and is stated by different ancient authors to have been 85, 90, 104, and 109 years. Clinton (*Fasti Hell.*) places his death 357 B.C., at the age of 104. We know little more of his personal history than that he was highly esteemed as a physician and an author, and that he raised the medical school of Cos to a very high reputation. His works were studied and quoted by Plato. Various stories are recorded of him by Greek writers, which are undoubtedly fabulous, and to which it is therefore unnecessary to advert; and we find legends regarding him in the works of Arabic writers, who term him 'Bokrát,' while the European story-tellers of the middle ages celebrate him under the name of 'Ypocras,' and, in defiance of chronology, make him professor of medicine at Rome, with a nephew of wondrous medical skill, whom he despatched in his own stead to the king of Hungary.

The works bearing the name of H., and termed the Hippocratic Collection, are more than 60 in number, and, as Dr Greenhill observes in his article on H. in Smith's *Dictionary of Greek and Roman Biography*, &c., 'the classification of these, and assigning each (as far as possible) to its proper author, constitutes by far the most difficult question connected with ancient medical writers.' Dr Greenhill divides the Hippocratic Collection into eight classes, of which we need specify only two. (For convenience, we give the Latin instead of the Greek titles.)

Class I.—Works certainly written by H., containing *Prognostica*; *Aphorismi*; *De Morbis Popularibus*; *De Ratione Victus in Morbis Acutis*; *De Aëre, Aquis, et Locis*; and *De Capitis Vulneribus*. Some eminent critics doubt the genuineness of some portions of the *Aphorismi*, the work by which H. is most popularly known.

Class II.—Works perhaps written by Hippocrates. These are eleven in number, and one of them is the well-known *Jusjurandum*, or 'Hippocratic Oath.'

The others consist of works written before H.; works whose author is conjectured; works by quite unknown authors; and wilful forgeries.

For anything like a full account of his views, we must refer to the various writers who have treated of the history of medicine. We can here only mention that he divides the causes of disease into two principal classes: the first consisting of the influence of seasons, climates, water, situation, &c.; and the second of more personal causes, such as the food and exercise of the individual patient. His belief in the influence which different climates exert on the human constitution is very strongly expressed. He ascribes to this influence both the conformation of the body and the disposition of the mind, and hence accounts for the differences between the hardy Greek and the Asiatic. The four fluids or humours of the body (blood, phlegm, yellow bile, and black bile) were regarded by him as the primary seats of disease; health was the result of the due combination (or *crasis*) of these, and illness was the consequence of a disturbance of this *crasis*. When a disease was proceeding favourably, these humours underwent a certain change (or *cocion*), which was the sign of returning health, as preparing the way for the expulsion of morbid matter, or *crisis*, these crises having a tendency to occur at definite periods, which were hence called 'critical days.' His treatment of diseases was cautious, and what we now term expectant; it consisted chiefly and often solely in attention to diet and regimen; and he was sometimes reproached with letting his patients die by doing nothing to keep them alive.

The works of H. were translated at an early period into Arabic. They were first printed in a Latin translation in 1525 at Rome. The first Greek edition (the Aldine) appeared the following year at Venice; an edition by Mercurialis appeared in 1588, one by Foësius in 1595, and one by Van der Linden (still much esteemed) in 1665. Other editions have appeared under the editorship of Chartier, Kühn, &c. The latest, and incomparably the best edition, is that of Littré, in 10 volumes, the first of which appeared in 1839, and the last in 1861. An edition by Ermerins, with a Latin translation, is now in course of publication at Utrecht, at the expense of the university of Amsterdam. The Latin title runs as follows: *Hippocratis et aliorum Medicorum veterum Reliquia. Edidit Franciscus Zacharias Ermerins*, 4to. The first volume appeared in 1859, and another in 1862. An excellent English translation of *The Genuine Works of Hippocrates* was published in 1849, in 2 vols., by the late Dr Adams, under the auspices of the Sydenham Society.

HIPPOCRE'NE (derived from *hippos*, a horse, and *krênê*, a fountain) is a fountain on Mount Helicon, about 20 stadia above the grove of the Muses, and, according to the mythical account, was produced by a stroke from the hoof of the horse Pegasus (q. v.). It was sacred to the Muses. In modern times, some have attempted to identify it with a fine spring at Makaristissa, and this opinion is most probably correct. See HELICON.

HIPPODAMI'A, the beautiful daughter of Æno-maus, king of Pisa, in Elis, and the Pleiad Asterope. It had been predicted to her father that he should be slain by his future son-in-law; he therefore stipulated that every suitor of his daughter should run a chariot-race with him, and that death should be the consequence of defeat. Thirteen, or, as some say, seventeen suitors had already been conquered and slain, when Pelops came to Lydia. Pelops

bribed Myrtilus, the king's charioteer, and thus succeeded in reaching the goal before (Enomaus, who, in despair, killed himself. H. became the wife of Pelops, and the mother of Atreus and Thyestes. She afterwards destroyed herself from grief, at being reproached with having led her sons to murder each other.

HIPPODROME (Gr. *hippos*, a horse, and *dromos*, a race-course), the Greek name for the place set apart for horse and chariot races. Its dimensions were, according to the common opinion, half a mile in length, and one-eighth of a mile in breadth. In construction and all important points of arrangement, it was the counterpart of the Roman Circus (q. v.), with the exception of the arrangement of the chariots at the starting-place. In the hippodrome, the chariots were arranged so as to form two sides of an isosceles triangle, with the apex towards the goal and a little to the right side. But as this would have given the chariots on the left side a longer course than those on the right, the hippodrome was constructed with the right side longer than the other (see figure of CIRCUS). The start was effected by setting free the chariots on the extreme right and left, and when they came opposite the next two, by setting them free also, and so on till all were in motion. The hippodrome was also much wider than the Roman circus, to allow room for the greater number of chariots, for though we have no precise information as to the number that usually started in one race, we know that Alcibiades on one occasion sent seven; Sophocles mentions ten chariots as competing at the Pythian games; and the number at the Olympic games must have been considerably greater. There is a beautiful description of a chariot-race in Homer (*Iliad*, xxiii. 262—650). The golden age of the hippodrome was during the Lower Greek Empire. The Blue and Green factions in the hippodrome carried their animosity into all departments of the public service, and laid the foundation of that perpetual disunion which rendered the Byzantine empire a prey to every aggressor.—The term Hippodrome has been given to a circus constructed in 1845 at Paris, and also to a large field in the plain of Longchamp, near Boulogne, used as a race-course.

HIPPOGRIFF, or **HIPPOGRYPH** (Gr. *hippos*, a horse, and *gryph*, griffin), a fabulous animal, which has been represented as a winged horse, with the head of a griffin. The hippogriff figures largely in the *Orlando Furioso* of Ariosto.

HIPPOLYTUS, the name of several saints and martyrs of the early church, among whom the chief interest is concentrated upon one who is believed to have flourished in the early part of the 3d c., to have been Bishop of Portus, near Rome, and to have suffered martyrdom under Alexander Severus. All the facts connected with the history of this saint have long been the subject of much doubt and controversy; and the interest of the discussion has been much heightened of late years by the discovery of a very curious and important work, certainly of the age of the supposed H., and calculated, if a genuine work of that author, to throw a most curious light upon the early history of the church. The work in question was one of several Greek MSS. obtained at Mount Athos in 1842, by M. Menas, an agent of the French government, and was published in 1851, at the expense of the university of Oxford, to which it was recommended as a work of exceeding interest for the history of the early church, by M. Emmanuel Miller, who undertook the task of editing it. M. Miller published it as a work of Origen, under the title of *Origenis Philosophumena*. The late Baron Bunsen was the

first to conjecture that the true author was H., but he was mistaken as to the particular work of H., which he took it to be; and for a time the question of the authorship remained in much uncertainty. Some critics still adhered to the opinion that the author was Origen; some ascribed the work to the Roman priest Caius; others, again, to Tertullian; and others, in fine, to some unknown Novatian heretic. The result of the discussion, however, seems to be, that although Bunsen was mistaken in supposing this treatise to be a work of H., which Photius has described as a '*little treatise against heresies*,' by that author, yet it is in reality a *larger treatise* on the same subject and by the same author.

There still remained, however, a further question, namely, Who is the H. who is to be regarded as the author? Without reckoning many later saints of that name, Dr Döllinger, in his *Hippolytus und Kallistus*, enumerates at least six contemporaneous, or nearly contemporaneous, with the supposed H. of Portus. It must suffice to state, that although not absolutely certain, the opinion that the author of the *Philosophumena* was the H. already known in the ancient church as a writer and as a martyr, has met with almost universal acceptance.

From the autobiographical details contained in the treatise, added to the particulars already known, we learn that this H., the time and place of whose birth are uncertain, was, about the year 218, Bishop of Portus, near Ostia, a suburban see of Rome, and as such, a member of the ecclesiastical council of that city. This fact receives a very decisive confirmation from a statue discovered in Rome in 1561, inscribed with the name of H., the title of his see, 'Portuensis,' and the paschal cycle of which H. is known to have been the author. In the persecution of Maximin, 235, H. was exiled to the island of Sardinia, from which he was permitted soon afterwards to return; but in a new outbreak of the persecution, he was put to death, probably in 238. Probably, from the connection of his see with the Roman Church, H. took an active part in the affairs of that church, and placed himself in violent opposition to the Bishop Callistus, whom he denounces in the treatise in the most unmeasured terms, both as to his private character and his public administration, as a person of most disreputable antecedents, as well as criminally lax in the government of the church, and especially in the administration of penance, after his election to the see. The tone which he adopts towards the Roman bishop, indeed, is so disrespectful as to appear to the Protestant critics a clear and conclusive evidence that, in the church of the 3d c., that bishop cannot have possessed the supremacy which the advocates of the papal pretensions ascribe to him. It is difficult, in truth, to conceive any bishop in the modern Roman system addressing the pope in such terms as those which H. applies to Callistus.

The Roman Catholic critics reply, that the very violence of the language employed, and the unscrupulous nature of the imputations, contain their own refutation; and they contend that no argument can be founded on H.'s opposition to the authority of the Roman bishop, inasmuch as not only the opinions expressed in this very treatise, but also the direct testimony of Prudentius (Hymn xi. v. 170—180), shew him to have been tainted with the Novatian heresy, or rather, although somewhat earlier, with the same opinions which in Novatus were condemned as heretical, and which eventuated in the Novatian schism. The validity of this plea, however, is strongly controverted by Bunsen. The works of H., which are numerous, and which

comprise dogmatical, exegetical, ascetic, and chronological treatises, were first published in a collected form by Fabricius, at Hamburg, 1716—1718. They are also found in the second volume of Gallandus.—See Bunsen's *Hippolytus and his Age* (1852; 2d ed. 1854); Miller's *Origenis Philosophumena* (Oxford, 1851); Döllinger's *Hippolytus and Kallistus* (Regensburg, 1853); Wordsworth's *St Hippolytus and the Church of Rome in the Third Century* (Lond. 1853).

HIPPOMANE. See MANCHINEEL.

HIPPOPHÆ. See SALLOW-THORN.

HIPPOPHAGI ('eaters of horse-flesh,' from Gr. *hippos*, a horse, and *phagein*, to eat), according to the accounts of the old geographers, were a Scythian people, living north-east of the Caspian Sea, where roam, at the present day, the Kalmuck hordes, who, retaining all the peculiarities of the old Scythians, still regard horse-flesh as a dainty. In Europe, repeated attempts have been made in modern times to introduce the practice, which has even been defended on economical grounds, but as yet they have failed to create a public taste for horse-flesh.

HIPPOPO'TAMUS (Gr. river-horse), a genus of pachydermatous quadrupeds, constituting a family by itself, and of which, until very recently, only one species was known as now existing, although the fossil remains of others indicate the greater abundance and wider distribution of the form in other periods of the earth's history. The largest and best known species, *H. amphibius*, is—or, within historic periods, has been—found in almost all parts of Africa, to which quarter of the globe it is entirely confined. A smaller species, *H. Liberiensis*, has recently been described as an inhabitant of the rivers of Western Africa within the tropics, and is said to differ remarkably from the common species, and from all the fossil species in having only two incisors, instead of four, in the lower jaw. The common *H.* is one of the largest of existing quadrupeds, the bulk of its body being little inferior to that of the elephant; although its legs are so short that its belly almost touches the ground, and its height is not much above five feet. It is extremely aquatic in its habits, living mostly in lakes or rivers, often in tidal estuaries, where the saltiness of the water compels it to resort to springs for the purpose of drinking, and sometimes even in the sea, although it never proceeds to any considerable distance from the shore. Its skin is very thick—on the back and sides, more than two inches; it is dark brown, destitute of hair, and exudes in great abundance from its numerous pores a thickish oily fluid, by which it is kept constantly lubricated. The tail is short. The feet have each four toes, nearly equal in size, and hoofed. The neck is short and thick. The head is very large, with small ears, and small eyes placed high, so that they are easily raised above water, without much of the animal being exposed to view. The muzzle is very large, rounded, and tumid, with large nostrils and great lips concealing the large front teeth. The *H.* cuts grass or corn as if it were done with a scythe, or bites with its strong teeth a stem of considerable thickness neatly through. The skull, while it is distinguished by remarkable peculiarities, corresponds in the most important characters with that of the hog. The respiration of the *H.* is slow, and thus it is enabled to spend much of its time under water, only coming to the surface at intervals to breathe. It swims and dives with great ease, and often walks along the bottom, completely under water. Its food consists chiefly of the plants which grow in shallow waters, and about the margins of lakes and rivers; and it probably renders no

unimportant service in preventing slow streams from being choked up by the luxuriance of tropical vegetation, the effect of which would, of course, be an increase of the extent of swampy land. It often, however, leaves the water, chiefly by night, to feed on the banks, and makes inroads on cultivated fields, devouring and trampling the crops. It is a gregarious animal; and the havoc wrought by a herd of twenty or thirty is very great, so that wherever cultivation extends, war is waged against the *H.*, and it disappears from regions where it formerly abounded. Thus it is no longer found in Lower Egypt, although still abundant further up the Nile. It is taken in pits, which are dug in its usual tracks; it is killed by poisoned spears, is pursued by means of canoes, is harpooned, and is shot with the rifle. The flesh is highly esteemed; the fat, of which there is a thick layer immediately under the skin, is a favourite African delicacy, and when salted, is known at the Cape of Good Hope as *Zee-koe speck*—that is, Lake-cow bacon. The tongue, and the jelly made from the feet, are also much prized. The hide is used for a variety of purposes; and the great canine teeth are particularly valuable as ivory, and are a very considerable article of African commerce.

The *H.* is lively and playful in its native waters; it soon learns to avoid man, and when it cannot retire among reeds for concealment, it dives and

Hippopotamus (*H. amphibius*).

remains long under water, raising only its nose to the surface when another breath becomes necessary. The female *H.* may sometimes be seen swimming with her young one on her back. The *H.* is generally inoffensive, but is occasionally roused to fits of rage, in which it becomes extremely dangerous, particularly to those who pursue it in boats. The voice of the *H.* is loud and harsh, and is likened by Burckhardt to the creaking and groaning of a large wooden door. That the *H.* is capable of being tamed, and of becoming much attached to man, has been sufficiently proved by the instances of living specimens in London and Paris. The first *H.* brought to Europe in modern times, a young one from the Nile, arrived in London in 1850. The *H.*, however, sometimes appeared in the spectacles of the ancient Romans. It is very generally supposed to be the Behemoth of the book of Job.

Fossil species.—Some six species of *H.* have been described from the later Tertiary strata—the Pleiocene and Pleistocene of Lyell. They occur in fresh-water marls, and in the bone-caves, into which they had been carried for food by the carnivorous animals that used the caves as dens. One species found in England and in considerable abundance

in the southern countries of Europe, was of a size as much greater than the living species, as its companion, the mammoth, was greater than the living elephant.

HIPPURIC ACID ($C_{11}H_8NO_6HO$) is a compound of great interest both to the chemist and to the physiologist. It derives its name from its having been first discovered in the urine of the horse, and that fluid, or the renal secretion of the cow, affords us the best and readiest means of obtaining it. The crystals of hippuric acid are moderately large, colourless, but subsequently becoming milk-white, four-sided prisms, which are devoid of odour, but have a faintly bitter taste. They dissolve readily in boiling water and in spirit, but are only sparingly soluble in cold water and in ether. Its chemical bearings shew that hippuric acid is intimately associated with benzoic acid on the one hand, and with glycine (or glycocholl) on the other. The acid is a product of the metamorphosis of the bodily tissues, especially of herbivorous animals. It is a normal constituent of the urine of the horse, cow, sheep, goat, hare, elephant, &c.; and most probably is to be found in the urine of all vegetable feeders. In the human urine of healthy persons living on an ordinary mixed diet, it occurs in very small quantity, but it is increased by an exclusively vegetable diet, and in the well-known disease diabetes.

Although hippuric acid usually occurs in mere traces in human urine, we can artificially produce it at will in the body, and cause it to be eliminated in comparatively large quantity by the kidney. If we swallow benzoic acid, it seems to take up glycine or the elements of glycine in its passage through the system, and thus to form hippuric acid, which appears abundantly in the urine. The hippuric acid occurring in the animal organism exists in combination with bases, and chiefly as hippurate of soda and hippurate of lime. The last-named salt can be obtained by the mere evaporation of the urine of the horse.

HIPPURITES, a very remarkable genus of fossil bivalve shells, peculiar to the Cretaceous strata, and so abundant in some of the Lower Chalk beds of the Pyrenees and other places, that the series has received, from some continental geologists, the name of Hippurite Limestone. The external form of the shell is so anomalous, that the genus has been tossed about by naturalists in an extraordinary manner; some have called it a coral, others an annelid, others a balanus, but the majority hold it to be a mollusc, differing, however, among themselves whether it is a brachiopod, a conchifer, or a cephalopod. The true relation of the genus has been lately determined by Mr S. P. Woodward, who has published a full description of its curious and anomalous structure in the *Journal of the Geological Society*, vol. xi. p. 40. He has shewn that it is a lamellibranchiate mollusc. The lower and fixed valve is produced and tapering, in some species reaching a length of more than a foot. On the one side are three furrows, representing the siphonal, muscular, and ligamental inflections of the shell. The upper and free valve formed a flat covering to the large lower valve. Sixteen species have been described.

HIRING is a contract by which one employs, for a limited time, another's property or labour for some consideration or reward. Where the thing hired is land or houses, see **LANDLORD AND TENANT**. In the Roman law, hiring was divided into—1. *Locatio rei*, or the hiring of a thing; 2. *Locatio operis faciendi*, or the hiring of work and labour; 3. *Locatio custodiae*, or the hiring of care and services to be performed or bestowed on the

thing delivered; 4. *Locatio operis mercium vehendarum*, the hiring of the carriage of goods from one place to another. These phrases are still sometimes employed both in the law of England and Scotland, but the subjects are more conveniently treated under other heads: see **INNS, LODGINGS, SERVANTS, CARRIERS, SHIPPING**. The only branch of the subject which seems to fall properly under this head, is the hiring of task-work or job-work. Sometimes it is difficult to establish a contract of this kind, but in general there must be either an express or implied contract to pay for the services. Thus, if A, seeing B's horse running away, at some expense catches it, and brings it back to B, there having been no contract or engagement on B's part to pay, he is not bound to pay A for his services, however beneficial they have been, nor can A keep B's horse till such expenses are paid. So, if B has deposited a chattel with A, who has incurred extraordinary expense in preserving it, B is not bound to pay anything. In the Roman law, however, and in the law of Scotland, A could keep the horse or chattel till he was repaid his expenses, or he could sue B for these. In England, however, there must at least be some implied request or contract. When a person is hired to do a thing in a given time, and takes much longer, or deviates from the contract, he is nevertheless entitled to be paid for his services, for the contract is not rescinded on these grounds, unless there was an express stipulation to that effect. During the progress of the contract, it is sometimes material to know which of the parties bears the loss in case of fire. It is difficult to lay down the rule in such cases, for everything depends on the nature of the contract. Whoever is the owner, in law, of the material at the time, bears the loss of it by an accidental fire. If, for example, a tailor engage to make a coat and to furnish the materials for a fixed sum, this is, in fact, two contracts—viz., a sale of the materials, and also work and labour bestowed on them; and in case of destruction of the subject before completion, the loss of the materials falls on the hirer, and the loss of the labour falls on the workman. So if a printer engaged for a fixed sum per sheet to print and complete a book, the hirer would bear the accidental loss of the paper, and the printer the loss of his labour and skill. Much, however, depends in all these cases on the terms of the contract. Where a workman engages to do work, he impliedly warrants to have reasonable skill, otherwise, if the work is useless, he cannot recover his money. In the case of robbery while goods are in the hands of a workman to work up, if the robbery resulted from his negligence, he bears the loss. So if he merely lost it. In case of a horse or chattel being hired, and accidental damage done, the *onus* in England lies on the owner to prove negligence in the hirer; but in Scotland the contrary rule prevails, and it lies on the hirer to prove he used due care.

HIRSCHBERG, an important manufacturing town of Prussia, in the province of Silesia, is romantically situated at the foot of a mountain, and at the confluence of two streams, the Bober and the Zacken, 30 miles south-west of Liegnitz. The town is ancient, and is still girt about by a double line of walls. Its Protestant church, a Gothic edifice, is worthy of mention for its beauty, its magnitude, and its excellent organ. H. is the centre of the extensive linen and other manufactures of the district. Pop. 7868.

HISPANIA, the name by which Spain was known to the Romans. According to W. von Humboldt, it is only a modified form of the original name, which he derives from *Ezpaña*, a Basque word, meaning a 'border' or 'limit,' and which he

understands to imply that the country formed the margin of Europe towards the Western Ocean. Of the other ancient names of the country, the chief are *Iberia*—the common designation among the Greeks, and believed to denote specially the region of the Iberus (modern Ebro)—and *Hesperia*, on account of its western situation.

Little definite or accurate knowledge of H. was possessed before the time of the Romans. The conquests of the Carthaginians first excited the alarm of the Romans, and led to the struggle on Spanish soil of these two great rivals. The triumph of the Romans, as every reader knows, was ultimately complete, and for the next two or three centuries, these indefatigable conquerors set themselves to the thorough subjugation of the whole country. This was finally effected in the time of Augustus, who also founded many Roman cities, adorned with splendid architecture, such as *Cæsar Augusta (Zaragoza)*, *Emerita Augusta (Merida)*, *Pax Julia (Beja)*, *Pax Augusta (Badajoz)*, *Legio VII. Gemina (Leon)*, &c. In addition, that emperor completed the system of military roads across the peninsula—one of the great features of Roman conquest everywhere—begun as early as 124 B. C., and thus threw open Spain from end to end; so that great numbers of Romans flocked into the country, and settling there, mixed with and modified the native Iberi, some of whom completely adopted Roman habits, and were spoken of as *Togati*.

To what stock of the human family the old Iberi of H. belonged, is one of the *questiones vexatæ* of scientific ethnography. That they are represented in modern times by the Basques (q. v.) is, however, universally admitted. Niebuhr holds that H. was originally divided among two peoples, the Celts and the Iberi, from a mixture of whom arose the *Celtiberi* (q. v.). The more common opinion, however, both in ancient and modern times is, that the Celts were not equally aboriginal with the Iberi, but invaders from Gaul; and that they, rather than the Iberi, were victorious in the strife that ensued.

HISPANIO'LA (Little Spain). See DOMINGO, SAN, and HAYTI.

HISTO'LOGY (derived from the Greek words *histos*, a web or texture, and *logos*, a discourse) is the science which classifies and describes the structural or morphological elements which exist in the solids and fluids of organised bodies. It is identical or nearly so with general minute anatomy and with microscopic anatomy. Although its origin may be traced to the times of Malpighi (1628—1694), who discovered the blood corpuscles, and of Leuwenhoek (1632—1723), who, with comparatively imperfect optical means, added much to our knowledge of the minute structure of the tissues, it never made any definite progress till the second decennium of the present century, when the compound microscope began to assume its present improved form. It was by means of this microscopic-chemical examination that the structure of the different horny tissues was first clearly exhibited, and it was thus proved that nails, cow's horn, and whalebone are similarly composed of aggregations of individual cells. Again, in the investigation of the nervous tissue, and of many other structures, chemistry and the microscope have been most usefully combined.

During the last quarter of a century, no department of medical science has made such rapid progress as histology. In Germany, it has been successfully cultivated by Schwann, Hewle, Valentin, Remak, Kölliker, Virchow, Leydig, Frey, and a host of others, scarcely less distinguished; in Holland, it has been actively prosecuted by Donders, Harting, and others; Lebert, Mandl, Robin, and others, have

contributed to the French literature of the subject; while amongst our own countrymen, the names of Todd and Bowman, of Goodsir, Queckett, J. H. Bennett, Lockhart Clarke, and Beale, deserve honourable notice.

HIT (the *Is* of Herodotus), a town of Turkey in Asia, is situated on the right bank of the Euphrates, in the pachalic of Bagdad, and 110 miles west-north-west of the city of that name. It is estimated to contain about 1500 houses, and is remarkable for the fountains of bitumen in the neighbourhood. These fountains or pits are as abundantly productive at the present day as they were in the earliest ages. From them bitumen and naphtha are obtained in great quantity, and exported.

HITCH, a knot or noose by which one rope is fastened to another, or to some other object, as a hook, a cleat, a ring, &c. There are many sorts of hitches—as clove-hitch, midshipman's hitch, rolling-hitch, &c. Several of these knots will be described and figured under **KNOT**.

HITCHCOCK, EDWARD, D.D., LL.D., an eminent American geologist, born at Deerfield, Massachusetts, United States, May 24, 1793, was head of the academy in his native place 1815—1818, pastor of the Congregational church at Conway 1821—1825, professor of chemistry and natural history in Amherst College 1825—1845, principal and professor of natural theology and geology 1845—1854, and still fills his favourite professorship of geology. In 1824, he published *The Geology of the Connecticut Valley*, a work which was well received, and opened the way to H.'s advancement. In 1830, he was appointed a state geologist, and as such, made a thorough survey of the geology and mineralogical resources, including also the botany and zoology, of Massachusetts, in 1830; of part of New York in 1836, and of Vermont in 1857. He published the fruits of his researches regarding Massachusetts in 1831; and after issuing supplementary reports in 1833 and 1838, embodied the whole in his *Final Report on the Geology of Massachusetts* (2 vols. 1841), which is the standard work on this subject. In 1850, H. was appointed agricultural commissioner for his native state, and received instructions to visit and examine the chief agricultural schools of Europe, which he did; and subsequently published his *Report on the Agricultural Schools of Europe*, a valuable work. But he has chiefly distinguished himself in the geological department of natural theology. His work on the connection between geology and religion—*The Religion of Geology and its connected Sciences* (1851)—has had a very wide circulation on both sides of the Atlantic. H. has come forward prominently as an expositor of the fossil footprints in the Connecticut Valley. The most important of his works, besides those mentioned above, are *Elementary Geology, with an Introductory Notice by Dr Pye Smith* (1840), a work which has become extremely popular, having gone through 25 editions in America, and eight in England; *Fossil Footmarks in the United States* (1848); *Ichnology of New England* (1858).

HITOPADE'SA (literally, 'good advice,' or 'salutary instruction,' from the Sanscrit *hita*, good, salutary; and *upadesa*, advice, instruction) is the name of the celebrated Sanscrit collection of fables, the contents of which have passed into almost all the civilised literatures of the earth. The collection itself, in the form in which we possess it, is founded on older works of a kindred nature, and is classed by the Hindus among their ethical works. See **SANSKRIT LITERATURE**.

HITTEREN, a considerable island on the west coast of Norway, lies about 47 miles west of the town of Trondhjem, and is about 30 miles long by 10 miles broad. Pop. about 3700, most of whom live by fishing.

HITZIG, FERDINAND, a German biblical scholar, was born 23d June 1807, at Hainingen, Baden, and educated at Heidelberg, Halle—where the influence of Gesenius determined him in favour of Old Testament studies—and at Göttingen. In 1833, he was called to Zürich as professor of theology, with a special view to the exegesis of the Old Testament; but his lectures, though mainly devoted to that department, have embraced also the New Testament, and the languages of the East, especially the Semitic. The first work which established his fame was his *Uebersetzung u. Auslegung d. Proph. Jesaias* (1833). Besides a translation of the Psalms, with a commentary (1835—1836), he has furnished for the *Ezegetisches Handbuch zum A. T.* the commentaries on the twelve minor prophets (1838; 2d ed. 1851), on Jeremiah (1841), Ezekiel (1847), Ecclesiastes (1847), Daniel (1850), and the Song of Solomon (1855), with a translation of all the prophetic books as a supplement (1854). He is also known by *Die Erfindung d. Alphabets* (1840), *Die Grabschrift d. Darius zu Naschki-Rustam* (1845), *Urgesch. u. Mythologie d. Philistäer* (1846), and by considerable contributions to periodicals.

HIVA-O'A, the principal island of the Marquesas group in the South Pacific Ocean, is about 22 miles long by 10 miles broad. Its northern point is said to be in lat. 9° 34' S., and in long. 139° 4' W. Pop. stated at 6500.

HIVITES ('Midlanders' according to Ewald, or 'Villagers' according to Gesenius), a Canaanitish people, who in the time of Jacob are found occupying the uplands of Ephraim, and later, the slopes of Hermon and the region westward towards Tyre.

H'LA'SSA, the capital of Tibet, situated on the Dzangtsu, in lat. 30° 45' N., and long. 91° 27' E.; the largest town in Central Asia, about 9500 feet above the level of the sea. It is famous for the convents in and near it, composing the ecclesiastical establishments of the Dalai-lama, whose personal residence is in a convent on the adjacent Mount Botala. H. is to Buddhism what Rome is to Catholicism, it is the head-quarters of the hierarchy of lamas, who, by means of the Dalai-lama, exercise priestly control over nearly all Mongolia, as well as Tibet. The city lies in a fertile plain, extending about 12 miles from north to south, and about 125 miles in length. Mountains and hills encircle it. A Chinese garrison is quartered near the Mount Botala, whose temples are resplendent with gold and precious stones. Since the expulsion of the Nepaulese in 1792, no foreigners are allowed entrance from the south. Pop. conjectured at 24,000.

HOADLEY, BENJAMIN, D.D., an eminent English prelate, was the son of the Rev. Samuel Hoadley, master of the Norwich Grammar School, and was born at Westerham, in Kent, November 14, 1676. In 1691, he entered Catherine Hall, university of Cambridge, where he became tutor after taking his degree of M.A. In 1701, he was chosen lecturer of St Mildred in the Poultry, London, and from this time began to attract attention as a controversial writer. His *Reasonableness of Conformity to the Church of England*, appeared in 1703, which, like all his other performances, though agreeable to the sentiments of the educated laity of the Church of England, was exactly the reverse to the great body of the clergy, both established and dissenting. Next year, he obtained the rectory of St Peter-le-

Poor, London, and was soon after engaged in a controversy with Dr Atterbury (q. v.) on the extent of the obedience due to the civil power by ecclesiastics. This contest was conducted by H. in such a way as to secure for him the applause of the House of Commons, who, in their address to the queen (Anne), referred to the important services he had rendered to the cause of civil and religious liberty. In 1710, H. was presented to the rectory of Streatham, in Surrey; and in 1715, when the accession of George I. had secured the triumph of Whig principles, was made Bishop of Bangor; but it is affirmed that he never visited this see, for fear of exciting a 'party fury.' He was, however, far from remaining idle. In 1717, he preached before the king a sermon on the text, 'My kingdom is not of this world,' in which he endeavoured to shew that Christ had not delegated his powers to any ecclesiastical authorities. He carried out this idea to great length, and maintained that it was the best and safest ground to take up in attempting to refute both Roman Catholics and Dissenters. Hence originated the famous Bangorian Controversy, regarding which Hallam says, that it was 'managed, perhaps on both sides, with all the chicanery of polemical writers, and disgusting both from its tediousness, and from the manifest unwillingness of the disputants to speak ingenuously what they meant.' H.'s principal opponent was William Law. Hallam speaks of having read forty or fifty pamphlets on the question. In 1721, H. was transferred to the see of Hereford; in 1723, to that of Salisbury; and in 1734, to that of Winchester. In 1735, he published a *Plain Account of the Nature and End of the Lord's Supper*; and in 1754—1755, two volumes of sermons, which were highly esteemed. He died April 17, 1761, in the 85th year of his age.

HO'BART TOWN, the capital of Van Diemen's Land, or Tasmania, stands on the Derwent, near its entrance into Storm Bay, on the south coast of the island. It is in lat. 42° 53' S., and long. 147° 21' E. The mean temperature for the year is 52°·3, being 42°·1 in winter, and 63°·1 in summer. According to the latest returns, the population is about 20,000. Besides the official buildings, which it possesses as the seat of government, H. T. has a college and several public schools; and its naturally excellent harbour is bordered by a noble quay, along which ships of the largest size can lie.

HOBBS, THOMAS, was born at Malmesbury, on the 5th April 1588, and was the son of a clergyman of that town. At the age of 14, he went to Oxford, and was put through the usual course of Aristotelian logic and physics. His instructions in the syllogism he afterwards held in very small estimation. At the age of twenty, having taken his degree and quitted Oxford, he was recommended to Lord Hardwicke, afterwards Earl of Devonshire, as tutor to his eldest son, this being the commencement of an intimate connection with that great family which lasted through his long life.

In 1610, he went abroad with his pupil, and made the tour of France and Italy. After his return, he still continued to live with the Devonshire family, and his residence in London afforded him opportunities of becoming acquainted with Bacon, Raleigh, Ben Jonson, and the other distinguished men of the time. Meantime, he was occupied with his classical, political, and philosophical studies, and prepared for publication his first work, a translation of Thucydides, which came out in 1628, he having now attained the mature age of forty.

The Earl of Devonshire having died in 1626, and the young earl, Hobbes's pupil, in 1628, he was plunged in great grief, and took the opportunity afforded him of going abroad with the son of Sir Gervase Clifton, and remained some time in France. In 1631, however, his connection with the Devonshire family was resumed. By the desire of the dowager-countess, he undertook the education of the young earl, the son of the former pupil, then only thirteen. In 1634, he went to Paris, and on this occasion was much in the society of Father Mersenne. He returned to England in 1637. He seems then to have applied himself to the composition of his first original work, entitled *Elementa Philosophica de Cive*, which was printed in Paris in 1642. This is the first exposition that he gave of his moral and political philosophy. His advocacy of pure and unrestrained monarchy as the best possible form of government, with an absolute submission on the part of the subjects both in law and in morality and religion to the will of the monarch, has probably given more general offence than any political theory ever propounded. It has been made the subject not merely of incessant attack, but of gross misrepresentation. He published soon after two small treatises, entitled *Human Nature*, and *De Corpore Politico*. The first contains his views as to the constitution of the mind, and entitles him to be considered as the father of modern systematic psychology. Although the work is valuable in itself, he still considers it as a prelude to the other treatise, *De Corpore Politico*, or on the nature of society, which is here handled for the second time by him, and in much the same strain. He goes over the whole ground a third time in the *Leviathan*, published in 1651, the fullest and perhaps the best known exposition of his views on mind, politics, morals, and religion. Here he contends as before in favour of pure monarchy, which he represents to have grown out of a primitive contract between the sovereign and the people, moved by the desire to escape from all the evils of a state of nature, which is a state of war. He is far from justifying tyranny; on the contrary, he enjoins upon the monarch a government according to just laws, and considers that this is more likely to be obtained by the government of a single person, whose selfish aims must be sooner satiated than if the supreme power were distributed in a number of hands.

After the meeting of the Long Parliament in 1640, he had returned to Paris, from his dread of the civil troubles. In 1647, he was appointed mathematical tutor to the Prince of Wales, afterwards Charles II., and stood high in the esteem of that prince; but the obnoxious character of his writings, especially after the publication of the *Leviathan*, so offended the royalist clergy, in common with all other sects, that Charles was induced to part with him; and he himself, being constitutionally timid, took the alarm for his personal safety, and abruptly fled from Paris to England. In England, he found himself safe, the Protestant government according him the most ample toleration. Very different was his position after the 'glorious' restoration of his own friends; for although Charles granted him a pension of £100 a year, the dislike to his views was so general that they were condemned by parliament in 1666, and he was even in danger of still severer measures. His connection with the Earl of Devonshire, with whom he lived in the latter part of his life, was no doubt a powerful protection to him. His old age was fruitful in additions to his writings, and was marked by some sharp controversies. His last works were a translation of Homer, and a History

of the Civil Wars. He died on the 4th September 1679, in his 92d year.

HOBBY (*Falco subbuteo*), a small species of falcon, a native of all or most parts of Europe, and of many parts of Asia and Africa. It is in its utmost length, about 12 or 14 inches. It is grayish-black or bluish-gray on the upper parts, each

Hobby (*Falco subbuteo*).

feather edged with yellowish-white, and the whole form is very elegant. The H. is occasionally seen in Britain, but is rare—rarer now than it seems to have been in former times. It was often employed in falconry, and trained to fly at pigeons and even at partridges.

HO'BOKEN, a city in New Jersey, United States, America, on the west bank of the Hudson River, opposite New York, with which it is connected by several steam-ferries. It has beautiful pleasure-grounds, called the Elysian Fields, and heights which afford a fine view of the cities of New York and Brooklyn, harbour, and fortifications. It is a great summer resort, and is rapidly becoming an important city. Pop. about 10,000.

HOCHE, LAZARE, one of the most eminent generals of the French republic, was born 25th June 1768, at Montreuil, a faubourg of Versailles. In 1785, he entered the army, rapidly obtained promotion, and was raised, in 1793, to the command of the army of the Moselle. Here he was opposed to the Duke of Brunswick, the commander of the Prussian army, and was by him repeatedly defeated. He was more successful against the Austrians, whom he drove out of Alsace. His next important service was putting an end to the civil war in La Vendée, which he accomplished in a prudent and patriotic manner. After having been sent, in the winter of 1796, as commander of the troops in the unfortunate expedition to Ireland, he was on his return appointed to the command of the army of the Sambre and Meuse. On the 18th April 1797, he crossed the Rhine at Neuwied, and had defeated the Austrians in several battles, when his career was stopped by the armistice concluded between the Archduke Charles and Bonaparte at Leoben. After the 18th Fructidor, he was suddenly taken ill in the camp at Wetzlar, and died 18th September 1797.

HO'CHHEIM, a small town in the duchy of Nassau, situated on an elevation sloping down to the right bank of the Main, about three miles from Mainz on the road to Frankfurt. The sunny slopes which here skirt the Main produce excellent wine of several varieties, which go by the general name of *Hochheimer*; from this comes the English name

Hock, now given indiscriminately to all wines from the Rhine regions.

HOCHKIRCH, or **HOCHKIRCHEN**, a village in the district of Bautzen, in Saxony, half-way between Bautzen and Löbau, was the scene of a battle between the Austrians and Prussians (14th October 1758) during the Seven Years' War. Frederic II. of Prussia, with an army 30,000 strong, having taken up an almost untenable position at H., was attacked at five A.M. under cover of a thick fog, by Marshal Daun, with 50,000 Austrians, and compelled to retire to the heights of Dresa. Here he was again attacked by the Duke of Aremberg, and after a conflict of five hours' duration, again retired. He lost 9000 men killed and wounded, and 101 cannons. He himself, and almost all his generals, were wounded. The Austrians lost 8000 men. On 20th and 21st May 1813, a series of battles took place here between the French and allies. See **BAUTZEN**.

HOCHSTADT. See **BLenheim**.

HODGKINSON, **EATON**, professor of the mechanics of engineering in University College, London, and the chief authority on the application of iron to architecture and engineering, was born at Anderton, near Northwich, Cheshire, 26th February 1789. At the age of 21, he settled in Manchester, and there commenced the study of mechanics. At this time the principal application on iron beams was Tredgold (q. v.), but his theories were overturned by H., who satisfactorily established a theory of his own on this subject. H. next made a series of 227 experiments on the strength of pillars, and here again his opinions came into collision with those of Tredgold, Moseley, &c., and with the same triumphant result. Almost all these researches were carried on in conjunction with, and at the expense of, Mr Fairbairn (q. v.). For his important experiments and calculations, and general co-operation in the construction of the Britannia Bridge, he received a first-class medal at Paris in 1855. His investigations are in general scattered through the *Transactions of the British Association for the Advancement of Science* (see especially vols. iv. and v.), and in the *Memoirs of the Manchester Society* (the most important of which are in the volumes for 1822, second series, and 1831). He also edited *Tredgold on the Strength of Cast Iron*, adding a supplementary volume containing his own theories (1842—1846). H. died in June 1861, at Broughton, near Manchester. See **STRENGTH OF MATERIALS**, and **TUBULAR BRIDGES**.

HODOMETER is an instrument for measuring the distance travelled over by any conveyance, and consists of an arrangement of toothed wheels, like clock-work, fixed on one side of a machine, and connected with the axle, from which motion is communicated to it. An index and dial shew the exact distance the vehicle has travelled.

HOE, an implement of gardening and of agriculture used for stirring the soil, drawing up earth to plants, thinning plants in drills, clearing the ground of weeds, &c. There are many forms of this implement, all of which may be referred to two classes—*draw-hoes* and *thrust-hoes*, the former having the blade almost at right angles to the handle; the latter almost in the same plane with it. The thrust-hoe, or *Dutch Hoe*, is chiefly used for killing weeds, and for stirring ground to a very slight depth. The draw-hoe, although much used as an implement of gardening, is scarcely used in Britain as an agricultural implement, except for the thinning (*singling*) of turnips, in which it is always employed. But in some countries it is very extensively used in place of the spade. In some

parts of the West Indies almost all the tillage of the ground is done by the hoe. It is more adapted than the spade to the use of labourers whose feet are not provided with shoes. Hoes intended for tilling the ground, instead of the plough and spade, are much larger and heavier than those used in British gardening, and are raised much higher, and brought down to the ground with greater force, somewhat like the pickaxe. Hoes for stirring very stiff soils are sometimes made with prongs instead of a blade.

In the improved agriculture of the present day, implements called *Horse-hoes* are extensively used. They are intended for purposes corresponding with those of the thrust-hoe, and may be generally described as consisting of thrust-hoe blades, variously modified, and attached to a frame in order to be drawn by a horse. Various contrivances are employed to accommodate the blades to inequalities of surface, &c. Horse-hoes can only be employed for crops sown in drills; and the drills must be perfectly parallel, if more than one interval is to be cleaned and stirred at once. With the sowing machines now in use, however, this is secured. In turnip-husbandry, a horse-hoe with several blades is often used to clear away the weeds from one interval.

HOE'S MACHINE. See **PRINTING**.

HOEVEN, **JAN VAN DER**, an eminent living Dutch naturalist. He was born in 1801 at Rotterdam, and after studying medicine at Leyden, established himself as a physician in his native town, where he remained till 1835, when he was elected to the professorship of zoology in the university of Leyden—an office which he still holds. His most important work is his *Handboek der Dierkunde* (Leyden, 1827—1833, in 2 vols.), of which a second edition, entirely recast, appeared in 1846; a German translation was published in 1848; and an English translation, by Professor Clark of Cambridge, under the title *Handbook of Zoology*, was issued, with important additions, both by the author and the editor, in 1856—1858. The fact that most of his works are memoirs, and written in Dutch, is a great check to their general perusal by English and French naturalists.

JAN must not be confounded with his brother, **CORNELIUS PRUYS VAN DER HOEVEN**, who is professor of medicine in the university of Leyden, and is the author of several important works, amongst which may be especially mentioned *De Historia Medicinæ* (Leyden, 1842), and *De Historia Morborum* (Leyden, 1846).

HOF, a manufacturing town of the kingdom of Bavaria, in Upper Franconia, is situated in a fruitful district on the Saale, 32 miles north-east of Bayreuth. Besides extensive manufactures of leather, and linen and woollen fabrics, an important transit trade, arising from its position on the frontiers of Bavaria, and on the railway connecting that country with Saxony, is here carried on. Iron and coal mines are worked in the vicinity. Pop. 8550.

HOFER, **ANDREAS**, the patriotic leader of the Tyrolese, was born at St Leonard, in the valley of Passey, 22d November 1767. In 1796, he led a body of Tyrolese against the French on the lake of Garda; in 1808, secret deputies, among whom was H., arrived at Vienna, to represent to the Archduke John the sufferings of the people, and their wish to be reunited to Austria. By the desire of the archduke, Baron von Hormayr sketched for them a plan of an insurrection, which met with such success that, in three days, from the 11th to the 13th of April 1809, nearly the whole country

was liberated. Napoleon, however, was victorious in Austria, and at once marched three armies to the Tyrol, to subdue the rebellious peasantry, who had been abandoned by the Austrians, in accordance with the armistice of Znaim (July 12, 1809). At first, H. concealed himself in a cave in the valley of Passseyr; but when Spechbacher, Joachim Haspinger, a Capuchin, and Peter Mayer, at the head of the armed population, renewed the defence of the Tyrol, and repeatedly defeated the enemy, H. issued from his retreat, and took the leadership of the Tyrolese. At the battle fought on the 12th of August on the Iselberg, Lefebvre was driven from the Tyrol. H. continued to conduct the civil and military administration till the peace of Vienna (14th October). The French and Bavarians poured, for the third or fourth time, into the country, and after a brief struggle H. was obliged to take refuge in concealment. After a lapse of two months, he was betrayed into the hands of the French by a priest named Douay, conveyed to Mantua, tried, and condemned to be shot. The sentence was carried into execution on the 20th February 1810. His family were indemnified for the loss of their property by the Emperor of Austria in 1819, and his son ennobled. A statue of H., executed by Schaller, was erected in 1834 in the church of the Franciscans, at Innsbruck, near the tomb of the Emperor Maximilian I.

HOFFMANN, FRIEDRICH, one of the most celebrated physicians of the last century, was born at Halle in 1660, and died in that city in 1742. At the age of fifteen, he lost his parents, who died from typhus fever, and very shortly afterwards became deprived by a fire of the small patrimony that devolved to him. Undismayed, however, by these misfortunes, he repaired in 1678 to Jena, to study medicine, and from thence proceeded to Erfurt, to become a pupil of the distinguished chemist Gaspard Cramer. He commenced practice at Minden in Westphalia, where he had influential connections, and where in a very short time he acquired a high reputation. After a residence of little more than two years in Minden, during which time he visited Holland and England, he removed to Halberstadt. In 1693, Frederick, Elector of Brandenburg, afterwards king of Prussia, appointed H. to the professorship of medicine in the newly constituted university of Halle. It was on his recommendation that the celebrated Stahl (q. v.), who had been his fellow-student at Jena, and subsequently became his great rival, was appointed one of his colleagues. At the urgent request of the king, he subsequently removed to Berlin, where he remained for three years; but finding that he could not pursue his studies in the atmosphere of the court, he returned to Halle; and although he subsequently attended the king at Berlin during a long illness, Halle was his place of residence during the remainder of his life.

As a physician and a medical teacher, H. enjoyed a celebrity second only to Boerhaave, who contemporaneously occupied the chair of medicine at Leyden. It is unnecessary here to enter into his special doctrines, which, although they long survived his time, are now of little practical value. Haller asserts that he amassed a large fortune by the sale of secret remedies, one of which (although its composition is now known) is still designated Hoffmann's Anodyne Liqueur (q. v.).

Of his numerous works, the greatest is his *Medicina Rationalis Systematica* (Halle, 1718—1740, 9 vols. 4to), which occupied him for more than twenty years, and was concluded in his eightieth year. His complete works have gone through various editions. His *Opera Omnia Physico-medica, Denuo Revisa, Correcta et Aucta*, were printed at Geneva in 1640,

in six folio volumes, and were reprinted after his death with five supplementary volumes of previously unpublished *Opuscula*. These were reprinted at Venice in 1745, in 17 volumes 4to, and twice subsequently at Naples on a still larger scale.

HOFFMANN, AUGUST WILHELM, F.R.S., a distinguished living chemist, born at Giessen in 1818. After obtaining the degree of doctor of philosophy, he became assistant to Liebig in the Giessen Laboratory, and subsequently he was appointed extraordinary professor of chemistry in the university of Bonn. When the Royal College of Chemistry was established in London in 1845, H. was recommended by Liebig as highly qualified for the important post of superintendent to the new institution. This college, which has since merged into the Laboratory of the Royal School of Mines, is still under his direction, and owes much of its high character to his teaching and his scientific reputation.

On the elevation of Professor Graham from the post of chemist to the Mint to the office of master of that institution, H. was appointed his successor. His chemical knowledge has been applied to several important practical points, amongst which may be especially noticed his examination of the waters of London, conducted by order of government. In conjunction with Dr Beme Jones, he has edited the later editions of Fownes's *Manual of Chemistry*. His numerous contributions to the *Annalen der Chemie und Pharmacie*, to the *Transactions of the Chemical Society*, and to the *Philosophical Transactions of the Royal Society*, are for the most part on the very highest departments of organic chemistry; and in 1854 a royal medal was awarded to him for his *Memoirs on the Molecular Constitution of the Organic Bases*, contained in the *Philosophical Transactions* and the *Transactions of the Chemical Society*. H. is now president of the Chemical Society. It was in the course of these researches that he discovered in coal-naphtha aniline, the basis of the new colours mauve and magenta, which had previously been only obtained from indigo. His latest publication (1862) is a lecture delivered before the Royal Institution on these two popular dyes.

HOFFMANN'S ANODYNE LIQUOR is the old name for the *Compound Spirit of Sulphuric Ether* of the London pharmacopoeia, and is a mixture of ether, alcohol, and ethereal oil. It is often prescribed with laudanum, in order to prevent the nausea which the opium preparations frequently excite, and may be given in water, unassociated with anything else, as a stimulant and antispasmodic, in doses varying from half a drachm to two drachms.

HOFWYL, a village of Switzerland, in the canton of Bern, and situated six miles north of the town of that name. It has been long famous as the seat of the educational and agricultural institution founded here by the late M. Fellenberg (q. v.). The institution is now carried on under the management of Dr Edward Müller.

HOG (*Sus*), a genus of pachydermatous quadrupeds, of the family *Suidæ* (q. v.). The neck is carried straight forward from the trunk, and is very thick and strong. The skin is very thick, and mostly covered with stiff bristles, among which a short curled hair is often also found. The bristles of the back of the neck generally become a mane in wild hogs, and particularly in the males, although, in domestication, this tends to disappear. The muzzle is elongated, and terminated by a movable cartilaginous disc, furnished, as in the mole, with a special small bone, and used, along with the tusks, as an implement for turning up the soil in search of roots and other food. There are 6 incisors, 2 canine teeth, and 14 molars in each jaw, the lower incisors

projecting forwards; the canine teeth long and strong, projecting and curved, becoming formidable tusks in wild boars, and large and powerful even in the females in a wild state. The feet have each four toes, the lateral ones small, and scarcely touching the ground, all separately hoofed. The tail is short. The stomach shews mere traces of division. The food is chiefly vegetable, but perhaps no animals may more properly be called omnivorous; and although, even in a wild state, hogs are not to be reckoned among beasts of prey, they not unfrequently, even in domestication, kill and eat small animals that come in their way, as many a housewife has had occasion to observe in respect to chickens.—The Common Hog (*S. scrofa*) appears to be a native of most parts of Europe and Asia, and domesticated swine were found by the first navigators in many of the islands of the southern seas. The wild boar is still found in the forests of many parts of Europe, and was at one time an inhabitant of those of Britain, where it was protected by game-laws in the 10th and 11th centuries; but at what time it ceased to exist as a wild animal in Britain is uncertain. The adult males, in a wild state, are generally solitary; the females and young gregarious; and when assailed by wolves or other beasts of prey, wild swine defend themselves vigorously, the stronger animals placing themselves in the front, and the weaker seeking shelter in the rear. The chase of the wild boar is one of the most exciting sports of Europe or of India, particularly when carried on without the rifle, and on horseback with the spear ('pig-sticking'). The speed of the animal is very considerable, and the chase sometimes extends to six or seven miles. Although the use of its flesh was prohibited to the Jews, and the prohibition has been adopted in the Mohammedan law, the hog has been a domesticated animal from a very early period, and its flesh constitutes a large part of the food of many nations. The fecundity of the hog is great; with proper treatment, it will produce two litters annually, generally of 4–8 pigs each, although sometimes there are as many as 14 in a litter. Vast quantities of the flesh are consumed in various forms in the British Islands and North America, as pork, fresh or salted, bacon, ham, &c. Brawn (q. v.) is an esteemed English luxury. The fat of the hog, which is produced in a thick layer under the skin, is an article of commerce, and of various use under the name of LARD (q. v.). The skin of the hog is made into leather, which is particularly esteemed for saddles. The bristles, particularly of the wild boar, are much used for brushmaking.

There are numerous varieties of the domestic hog, of which some have erect, and some pendent ears; and those are most esteemed which exhibit the greatest departure from the wild type, in shorter and less powerful limbs, less muscular and more rounded forms, &c. The Chinese breed and the Neapolitan have been of great use in the crossing and improving of the breeds commonly reared in Britain, giving rise to the improved white and black breeds respectively. Hogs are profitably kept wherever there is much vegetable refuse on which to feed them, as by cottagers having gardens, farmers, millers, brewers, &c. They are often allowed to roam over fallow ground, which they grub up for roots, and over stubble-fields, which they glean very thoroughly. They are also fed in woods—an ancient practice—where they consume acorns, beechmast, and the like. When they are fed, as is sometimes the case, chiefly on animal garbage, their flesh is less palatable and less wholesome.

The hog has a reputation which it does not deserve, of peculiar filthiness of habits. It is true

that it wallows in the mire, as the other *pachydermata* also do, to cool itself and to provide itself with a protection against insects, and it searches for food in any puddle; but its sleeping-place is, if possible, kept scrupulously clean. The too common filthiness of pigsties is rather the fault of their owners than of their occupants; and a clean and dry sleeping-place is of great importance to the profitable keeping of hogs.

The hog is not inferior to other quadrupeds generally in intelligence. It can be easily rendered very tame and familiar. Its acuteness of scent has been turned to account in making it search for truffles; and an instance is on record of a pig having been used as a pointer, in which service it learned to acquit itself extremely well. Instances have occurred of the use of the hog as a beast of draught.

The forests of the island of Papua or New Guinea produce a species or variety of hog (*S. Papuensis*), more widely different from the common hog than its breeds are from one another. It is 18 or 20 inches high, with short ears, and very short tail. The colour is mostly brown. The Papuans have not properly domesticated this animal, although they often trap the young ones and keep them till ready to be killed for use. The flesh is very delicate.

The Babyroussa (q. v.) is another and very remarkable species of hog.

The *Bosch Vark*, or Bush Hog of South Africa (*Choiroptamus Africanus*), is about two feet six inches high, covered with long bristles; it has projecting tusks, a large callous protuberance on each cheek, and long sharp tufted ears. It is gregarious, subsists chiefly on vegetable food, and makes destructive inroads on cultivated fields.

HOG PLUM, SPANISH PLUM, AND BRAZILIAN PLUM, names given in the West Indies and other tropical countries to the fruit of certain species of *Spondias*. The genus *Spondias* belongs to the natural order *Anacardiaceae*, or, according to some botanists, to a small order called *Spondiaceae*, differing from *Anacardiaceae* in the want

Hog Plum.

of a resinous juice, and in the drupe having a nut with 2–5 cells and seeds, instead of one cell and one seed. The species of *Spondias* are trees and shrubs with pinnate leaves, which have a terminal leaflet, and flowers in racemes or panicles. Some of them produce very pleasant fruits, among which may be reckoned *S. purpurea* and *S. lutea*; the species generally called Hog Plum in the West Indies, because they are a common food of hogs, which revel in their abundance. *S. purpurea* has fruit about an inch in length, ovate or

oblong, purple or variegated with yellow; the pulp yellow, with a peculiar but agreeable acid and aromatic taste. The fruit of *S. tuberosa*, called *IMBUZEIRO* in the north of Brazil, is about twice the size of a large gooseberry, oblong, yellowish, with a leathery skin and sweetish acid pulp. A much esteemed Brazilian dish is prepared of milk, curds, sugar, and the pulp of this fruit, from which also a refreshing beverage is made for use in fevers. The tree is remarkable for the numerous round black tubers—about eight inches in diameter—which it produces on its widely spreading roots, and which are very cellular, and full of water. They are evidently intended for the wants of the tree in the dry season, and are often dug out by travellers for the sake of the water, of which each tuber yields about a pint.—Closely allied to *Spondias* is the genus *Poupartia*, to which belongs the *VI* or *TAHITI APPLE*, formerly *Spondias dulcis*, a very fine fruit of the South Sea Islands.

HOG RAT, or **HUTIA** (*Capromys*), a genus of quadrupeds, of the family *Muridae*, differing from rats in having four grinders on each side in each jaw, with flat crowns. The tail is round and slightly hairy, and is used for support in sitting erect, as by kangaroos, and for aid in climbing trees, in which these animals are very expert. They make much use of their fore-paws, as of hands. Their food is entirely vegetable. They are natives of Cuba, where they are found in large numbers in the woods. They were much used as food by the aborigines. The best known species is of the size of a small rabbit.

HOGARTH, WILLIAM, a celebrated painter and engraver, born in London in the year 1697, served his apprenticeship to a silversmith in Cranbourne Street, named Ellis Gamble, and next studied for some time under Sir James Thornhill, the historical painter, but not with any marked success. About 1720, he set up for himself, and his first employment was to engrave coats of arms, crests, shop-bills, &c., after which he undertook to execute plates for booksellers, the chief of which are the prints illustrative of *Hudibras* (Lond. 1726). He now tried his hand at portrait-painting, and soon had ample employment, though he never cared anything for this branch of art. In 1730, he married (clandestinely) a daughter of Sir James Thornhill, and soon after began to display his extraordinary talent for representing in pictures the follies and vices of his time. In 1733, appeared his 'Harlot's Progress,' a series of six pictures, which, like his other works, were engraved by himself. It was these engravings, and not the original paintings, that made H. a rich man, and enabled him to keep his carriage at the age of forty-eight. The 'Harlot's Progress' was followed by other moral histories and satirical representations of vice and folly, such as 'The Rake's Progress,' published in eight engravings, 'Southwark Fair,' 'A Modern Midnight Conversation,' 'The Distressed Poet,' and 'Strolling Actresses in a Barn.' The success of these was great, and inspired H. with the belief that he could also win a reputation as an historical painter. After several ineffectual attempts, he recovered from his delusion, and returned to the path which nature had appointed him. In 1741, he published 'The Enraged Musician;' in 1745, 'Marriage à la Mode,' in a series of six engravings, the pictures for which were purchased for the National Gallery; and in 1748, 'The March to Finchley.' In 1753, he published his *Analysis of Beauty*, a work which excited much opposition and ridicule, and H. is generally held to be erroneous in the conclusions at which he arrives. In 1755 appeared 'Four Prints of an Election;' and in 1762, 'The Times,'

a cutting satire upon Pitt. He died in 1764, and was buried at Chiswick, where a handsome monument was erected to his memory, with an inscription by his friend Garrick. In the technical part of his art, H. was long thought not to have excelled, but modern opinion is more favourable in this respect. There has never, however, been any but one opinion regarding the greatness of his thought and invention, and his deep insight into the characteristics of his time and country. The moral of his satire is always stern, true, and unmistakable. A handsome edition of his works from the original plates, retouched by Heath, was published by Nichols (3 vols. Lond. 1820—1822); others appeared at Leipsic (1831—1835; 3d. edit. 1841), and at Stuttgart (1839—1840).

HOGG, JAMES, a Scottish poet, was born in the district known as the Forest of Ettrick, in Selkirkshire, in 1772, and was at school for two or three winters before he reached the age of eight. At that early age, he entered upon the occupation of shepherd. His first song appeared anonymously in 1801, and having gone shortly after to sell his employer's sheep in Edinburgh, he threw off 1000 copies of verses which he had written. In the same summer, Scott visited the Ettrick Forest in search of materials for his *Border Minstrelsy*, when H. made his acquaintance, and placed in his possession a number of ballads, taken down from the recitation of persons resident in the district, which appeared in the third volume of the *Minstrelsy*, in 1803. In the same year, he published *The Mountain Bard*, the proceeds of which, together with two prizes for essays he received from the Highland Society, amounted to £300. With this sum he took a farm, which proved a disastrous speculation. In 1810, he began a course of regular authorship. In 1813, his poem *The Queen's Wake* appeared. In 1814, he married; and although he afterwards went to live on a farm given to him by the Duke of Buccleuch, he busied himself more with books and booksellers than with sheep and grazing. His pen was profitable, which was more than he could bring his farm to be. He died at Altrive, on the 21st November 1835. His works are numerous, comprising, in addition to those already mentioned, *Madoc the Moor*, *The Pilgrims of the Sun*, *The Jacobite Relics of Scotland*, *Queen Hynde*, *The Border Garland*; and some songs of great beauty. He also wrote extensively in prose. His prose works are—*The Brownie of Bodsbeck*, *Winter Evening Tales*, *The Three Perils of Man*, *The Three Perils of Woman*, *The Altrive Tales*, a volume of *Lay Sermons*, and a *Life of Sir Walter Scott*.

After Burns, H. is unquestionably the greatest peasant-poet which Scotland has produced. His finest work, both in conception and finish, is *The Queen's Wake*. The general flow of the poem is lively and harmonious, while in one portion, that of 'Kilmeny,' the reader seems to hear 'the horns of Elfland faintly blowing;' and in another, 'The Witch of Fife,' he is introduced into the weirdest witch and wizard world. His prose works are very unequal, but they occasionally display great humour, and always abound in graphic description.

HOGMANAY, or **HAGMENA**, a word of doubtful derivation, applied in the north of England and Lowlands of Scotland to New Year's Eve. See **NEW YEAR**. It is customary for persons to go on 'Hogmanay night,' from door to door, asking in rude rhymes for cakes and cheese (and sometimes for money), on receiving which they pass on to the next house.

HO'GSHEAD, an old English measure of capacity. For wine, it was equivalent to 63 gallons; for ale

and beer, to 54 gallons. In the United States, it is still used as a measure for liquids, equivalent to 63 gallons; but when used for tobacco, it varies in different states from about 750 to 1200 lbs.

HOGUE, CAPE LA. See **CAPE LA HOGUE**.

HOHENLINDEN, a village in Upper Saxony, with 250 inhabitants, famous for the victory gained there by Moreau over the Archduke John, 3d December 1800. After the expiration of the armistice concluded at Paersdorf, on the 13th November, Moreau's army took up a position on the plateau between the Isar and the Inn, and the Austrian army, under the Archduke John, on the right bank of the Inn. The Austrian main body advanced amidst drifting snow, and attacked the divisions of Grénier and Grouchy with the utmost fury; but the French receiving considerable reinforcements under Ney, the assailants were driven back; and being attacked in the rear, were totally routed. The victory was likewise decided at other points in favour of the French, who were only prevented from pursuing the vanquished by the inclemency of the weather, the badness of the roads, and the short winter day. The Austrians had 8000 men killed and wounded, 11,000 made prisoners, including 180 officers and 100 pieces of artillery. The French had 5000 men killed and wounded. In consequence of this battle, the negotiations between the belligerent powers were resumed, and shortly after ended in the peace of Lunéville.

HOHENSTAUFEN, a German princely house, which kept possession of the imperial throne from 1138 to 1254. The founder of the family was **FREDERICK VON BÜREN**, who lived about the middle of the 11th c., and assumed the name of H. from a castle of that name, the ruins of which are still to be seen on the summit of the Hohenstaufen Berg (2240 feet), a hill on the left bank of the Danube, about 30 miles below Stuttgart. A son of his was the Chevalier Frederick von Staufen, Lord of H., who steadfastly supported the Emperor Henry IV., and in return received the duchy of Swabia. Duke Frederick, at his death in 1105, left two sons—Frederick II., the One-eyed, and Konrad; the former was immediately confirmed in Swabia by Henry V.; and in 1112 the latter received the duchy of Franconia. After the death of Henry V., his family estates fell to the House of H.; and Lothaire of Saxony was elected as his successor in the empire.

On Lothaire's accession, he revoked the grants made by previous emperors to the House of H., and thus gave rise to a furious war, in which Duke Frederick (his brother Konrad being absent in the Holy Land) had to encounter, single-handed, the whole power of the emperor, the House of Zähringen, and Henry the Proud, Duke of Bavaria and Saxony. After Konrad's return, fortune at first seemed to favour the brothers, but in 1135 they were compelled to implore the emperor's forgiveness. They were then put in possession of all their estates. Konrad, in 1138, was elected Emperor of Germany, under the title of Konrad III. The succeeding emperors of this family were **FREDERIC I.** (q. v.) (1152—1190), **HENRY VI.** (1190—1197), **PHILIP I.** (1198—1208), **FREDERIC II.** (q. v.) (1212—1251), and **KONRAD IV.** (1251—1254).

HOHENSTEIN, a small manufacturing town in the kingdom of Saxony, situated 12 miles north-east of Zwickau. Woollen, cotton, and linen goods, and machinery, are the principal items of manufacture. Pop. 5380.

HOHENZOELLERN, a province of Prussia, consisting of a narrow strip of land entirely surrounded by the territories of Württemberg and Baden. Superficial area about 480 square miles;

pop. (1858) 64,235. The territory, whose surface is generally mountainous, is divided into the districts of Sigmaringen and Hechingen, which rank as mediatised principalities. The seat of provincial government is at Sigmaringen. H. is watered by the Neckar and some of its affluents, and by the Danube, which crosses it; it is also traversed by the eastern offshoots of the mountain-ranges of the Black Forest, the Rauhe Alb, and the Hart. The mountain valleys are productive, and yield an abundance of fruit and corn, and flax in sufficient quantities for exportation; the forests abound in fine timber; there are iron mines in some of the mountain districts, which also yield gypsum, salt, and coal. The principal branches of industry are agriculture and the rearing of cattle, and the manufacture of toys and other articles in wood.

The population belongs almost exclusively to the Roman Catholic religion, and is under the jurisdiction of the Archbishop of Freiburg. There is a Catholic college at Hechingen.

The Hohenzollern family traces its descent from Count Thassilo, who lived about the beginning of the 9th c., and founded a castle near Hechingen, on the Zollern heights, whence his descendants derived their patronymic. About 1165 the first separation took place, Frederic IV. founding the elder or Swabian, and Konrad I. the younger or Franconian line. The elder line was subdivided, in 1576, into the branches of H. Hechingen and H. Sigmaringen. Frederic VI., the representative of the younger line, in 1415 received from the Emperor Sigismund the investiture of the electorate of Brandenburg, thus founding the present reigning dynasty of Prussia. The two branches of the elder line continued unbroken till 1849, when, in accordance with a family compact formed in 1821, which declared the king of Prussia chief of the joint Houses, the reigning princes of H. Hechingen and H. Sigmaringen ceded their respective rights and principalities to that monarch, who agreed to pay an annual pension of 15,000 thalers to the former, and one of 25,000 thalers to the latter. The princes were to retain their estates and bear the title of Highness, but were to exercise no act of sovereignty.

HOKIANGA, a river of New Zealand, enters the Southern Ocean on the west coast of the North Island—its mouth being in lat. 35° 30' S., and long. 173° 26' E. This point is almost the antipodes of Tangier, on the south side of the Strait of Gibraltar.

HOLBACH, PAUL HEINRICH DIETRICH, BARON VON, a French philosopher of the 18th c., was born of wealthy parents, at Heidelberg, in the Palatinate, in 1723. At an early age, he went to Paris, where he continued to reside during the remainder of his life. He died 21st June 1789. As H. was remarkable for his agreeable social qualities, and kept a good table, the most eminent thinkers and writers of the day, such as Condorcet, Diderot, Duclos, Helvetius, Raynal, Rousseau, Buffon, &c., were in the habit of assembling at his house. The witty Abbé Galiani called H. the *maître d'hôtel* of philosophy. Here speculation, it is said, was carried to such daring lengths, that Buffon, D'Alembert, and Rousseau were compelled to withdraw from the circle. H. was the zealous champion of naturalism, and contended not only against Christianity, but against every positive religion. His principal work is the *Système de la Nature* (published in 1770). In this work, the author endeavours to expound the natural principles of morality, and to investigate the origin of the conflicting opinions on virtue and vice. He discusses the maxims of religious morality, and takes a rapid survey of

social and savage life. He touches on the so-called 'social compact,' and in the course of his observations tries to prove, among other things, that self-interest is the ruling motive of man, and that God is only an ideal being, created by kings and priests. The materialism of the French *philosophes* of the 18th c. is nowhere more pernicious and paltry than in the writings of Holbach. It is but fair to state that his life was better than his books. He was a man of good heart, and in spite of his theory, of most unselfish benevolence. When the Jesuits fell into disgrace during the reign of Louis XV., H., though he hated their system, and had written against them in the days of their prosperity, made his house an asylum for his old foes when the clouds gathered round them.

HOLBEIN, HANS, the Younger, one of the first masters of German art, was born at Gr \ddot{u} nstadt in 1497. He learned the rudiments of art from his father, Hans Holbein the Elder, also a painter of great merit (born 1450, died 1526). When little more than 16 years of age, he adorned several houses and churches at Basel with portraits, frescoes, and altar-pieces. Tradition has preserved many of his droll sayings, and his life is as rich in anecdotes as those of the greatest Italian painters. H. growing tired of Basel, Erasmus, who took a great interest in him, and endeavoured to induce him to abandon his irregular course of life, introduced him to Sir Thomas More, who kept him employed in England for nearly three years, and then invited Henry VIII. to view the pictures. Henry, surprised and delighted, exclaimed: 'Is the artist still alive, and is he to be had for money?' More presented H. to the king, who took him into his service, and rewarded him liberally. H. continued to reside in England, highly esteemed and fully employed, till, in 1554, he died of the plague. Though chiefly, and at many periods of his life almost exclusively, a portrait-painter, in this style he stands on a level with the great Italian masters, and takes precedence of all his German contemporaries. His portraits are not ideals, but nature apprehended in its most intellectual features; the execution is rich and perfect. To the earlier part of his career belong his most celebrated paintings, including 'The Last Supper,' 'The Dance of Death,' several pictures in the Dresden Gallery, two famous portraits of courtesans, &c. At a later period, his execution is slighter, and his style of colouring not entirely free from the mannerism of those Flemish painters who had studied in Italy. Some splendid and able portraits by H., belonging to this period, are to be seen in the Louvre at Paris, in the Berlin Museum, at Longford and Windsor Castles. Eighty-seven sketches of persons belonging to the court of Henry VIII. by H. are still extant. His 'Dance of Death,' the illustrations of the Old Testament, and three sets of alphabet initials, would certainly entitle him to rank as one of the first wood-engravers, supposing them to have been not merely designed, but likewise engraved by him. This opinion has, however, been disputed, and the question remains undecided at the present day. A selection from H.'s pictures in the library at Basel were published in lithographs in 1829, by Birmann and Sons at Basel.—Compare *Hans Holbein der Jüngere* (Berlin, 1827).

HOLBERG, LUDVIG, the creator of modern Danish literature, and not only the earliest, but the wittiest and best writer of light comedy in Denmark, was born in 1684 at Bergen, in Norway, at the period when the latter country formed part of the Danish dominions. The ten years which

succeeded his appointment, in 1718, as professor of metaphysics in the university of Copenhagen, where he had studied with the original intention of entering the church, embrace the most active literary period of his life; for during that time he composed his various satirico-heroic poems and romances, and the greater number of his numerous comedies, which are still regarded by his countrymen as the best productions of their kind in the Danish language. The creation of a national theatre in 1722 by King Frederick IV., who sent for French actors to teach Danish players the art of declamation, had led H. to try his talents in dramatic writing, and the success which attended the attempt was speedily followed by others still more felicitous. Wealth and honours poured in upon him as he advanced in years, and he received a patent of nobility in 1746. He died in 1754, bequeathing his property to the Danish Royal Military Academy of Soroe. H.'s collected works were published in 27 volumes octavo at Copenhagen in 1826; and in 1842, an association was established in that city for the better editing of his writings, the dramatic portion of which was edited by Liebenberg in 1843—1847.

H.'s first satirico-heroic poem of *Peder Paars* (1719), and his *Niels Klims underjordiske Reise* (1741), which appeared originally in Latin, but which was speedily translated into several modern languages, rank among his best productions, although among his numerous comedies there are many that have enjoyed an almost equal popularity. Of these we may instance as especially notable for their broad humour and truth to nature, *Den politiske Kandestoiber*, *Jeppe paa Byerget*, *Den Stundesløse*, and *Julestuen*.

HOLCUS. See **SOFT GRASS**.

HOLD is that interior compartment of a vessel throughout her length which is nearest to the keel. From the lowermost deck it extends to the very bottom of the ship; it is always below the water-line, and dependent on the hatchways for ventilation and what little natural light it obtains. In merchant-vessels, the greatest portion of the cargo is stored in the hold; in men-of-war, it contains the bread-room, filled with provisions, the water-tanks for the supply of the ship's company, and almost all miscellaneous stores, such as spare masts, sails, blocks, &c. For this latter purpose, the hold is subdivided into several sections by bulk-heads. The *after-hold* lies abaft the main-mast, the *main-hold* just before the same mast, and the *fore-hold* is from the bow nearly to the main hatchway.

HOLDING, the term in Scotch Law used to denote the manner in which heritable estate is holden, corresponding to the English Tenure (q. v.). All the land in Scotland is presumed to be holden of the crown as the superior, and all persons who hold the lands are called vassals. The great proprietors are called crown-vassals, and the little proprietors, who generally hold under the crown-vassals, are called vassals. The chief holding is called *feu-holding*, which means that the vassal holds the land for ever, subject to a feu-duty or annual payment in money or grain to the superior. Each vassal can carve out his land into smaller feus, and sell them to sub-vassals, to whom he stands in the relation of a superior, and so on to infinity. This is not a mere form, but enters into the substance of land transfers, and entails great expense on all landholders, because each vassal must always have his title complete, which means he must pay up the little dues and perquisites which constantly result out of this feudal principle to his superior. In England, this practice of subinfeudation was put a stop to by 18 Edw. I., and now most of the land in England is

held in freehold, which means that each owner is entire master of his land, and pays fees or perquisites to nobody, not even to the crown. Besides feu-holding in Scotland there is blench-holding, which means a holding where the payment is nominal. Formerly, there were also ward-holding and Mortification (q. v.), the latter being the holding by which churches and religious houses were held. There is also burgage-holding, applicable to lands within Burghs (q. v.), and the transfer of burgage tenements has been lately put on a similar footing to other tenements.

HOLDING OVER, a phrase in English Law, meaning that a tenant, after a regular notice to quit, or the end of his term, still refuses to quit, and holds over. In such a case, the tenancy is held to be renewed on the same terms from year to year, if the landlord chooses not to enforce the quitting; but if the tenant himself gave the notice to quit, or the landlord demands possession at the expiration of his notice, and then the tenant refuses to quit, he is thereafter liable to double rent, or double value according as the notice to quit came from the tenant or the landlord. In Scotland, this renewal of the contract is called *Tacit Relocation* (q. v.); but no liability to double rent is incurred.

HOLIDAY, in Law, means Christmas Day, Good Friday, and any other day appointed for a public fast and thanksgiving. There are other holidays usual in public offices and courts of law. When a bill of exchange falls due on a Sunday, Christmas Day, or Good Friday, payment must be made the day previous. In Scotland, however, Christmas Day and Good Friday are not treated as holidays. In England, the courts excuse a man for not giving notice of dishonour of bills of exchange not only on Sunday, Good Friday, and Christmas Day, but also even on the festival days of his own religion; and though there has been no decision in Scotland on the subject, the same rule would no doubt be applied to fast-days prescribed by different sects, and a notice sent on the day following would suffice. But as a general rule, and in all other respects, it may be laid down that no sect, established or unestablished, nor any court or public body, has any power whatever to declare a holiday which has any legal effect, or which can bind the public or the rights of third parties. Nothing but an act of parliament has that effect, and not even a proclamation of the Crown would be sufficient. Hence it is that when a solemn national fast is proclaimed, which is to be put on the same footing as a Sunday, it requires a special act of parliament to make it binding on the public in matters of business.

HOLINSHED, RAPHAEL, an English chronicler, was born of a Cheshire family, in the early part of the 16th c., and died between 1578 and 1582. The work by which he is remembered is entitled *The Chronicles of England, Scotlande, and Irelande* (2 vols. fol. Lond. 1577). This edition—the first—is known as the ‘Shakspeare’ edition, from the fact of its having supplied the great dramatist with materials for his historical plays. It contained some passages disagreeable to Queen Elizabeth, which were omitted in the second edition of 1587. A modern edition, in 6 vols., was published in 1807—1808, with the ‘disagreeable passages’ restored. H., although the principal, was not the only author of these *Chronicles*. He was assisted in his labours, among others, by William Harrison, who wrote the historical descriptions of the island of Britain; and by Richard Stanihurst, who contributed an account of the condition of Ireland, to which John Hooker added the ‘Conquest of Ireland’ (a translation from the Latin of Giraldus Cambrensis). H. has always

been a great favourite with black-letter scholars, and has been freely used by modern historians.

HOLKAR, the name of a powerful Mahratta family, the members of which have at various times been formidable enemies to the British empire in Hindustan. The founder of the family was MULHAR RAO HOLKAR, who was born in the Deccan, 1693, and having gained by his valour the favour of the Peishwah, obtained from him the western half of Malwah, with Indore for his capital. In 1761, he joined the great league of the princes of Hindustan, formed to bar the progress of Ahmed Shah Durani, and was present at the battle of Paniput, 14th January 1761; but as he fled shortly after the battle had commenced, he was suspected of treason. H. was the only Mahratta chief of note who returned from that dreadful slaughter. He died in 1768, and was succeeded by his niece, Aylah-Baee, who resigned the military power to TOKHAGI HOLKAR. On his death in 1797, his natural son, JESWUNT RAO HOLKAR, a man able, brave, and unscrupulous, seized Indore, but was driven out by Scindia. Such, however, was H.’s reputation for energy and ability, that part of the victorious army deserted to him, with whom, and his own troops, he obtained a signal victory over Scindia and the Peishwah (October 1802). After fighting a long time against the British with varying success, he was compelled to conclude peace, and died insane, October 20, 1811. His son, MULHAR RAO HOLKAR II., a minor nine years old, succeeded, and in 1817 declared war against the British, but his army was totally routed at Mahedpore, 21st December; whereupon he sent offers of peace, which were accepted, and an *English residency* was established at Indore in January 1818. He died in 1833. MARTUND RAO HOLKAR, HURRI RAO HOLKAR, and KUMDI RAO HOLKAR, successively ruled after him; but the last of these dying without heirs, the East India Company assumed the right of nominating MULKERJI RAO HOLKAR, who was educated under the auspices of the British government, and who has displayed great ability since he assumed the reins of government in 1852. On the breaking out of the mutiny in 1857, he took the field in support of the British, but the refractory behaviour of his troops prevented his rendering any effective assistance.

HOLLAND, LORD, HENRY RICHARD FOX, VASSALL-HOLLAND, third baron, F.R.S., an English statesman, was descended from Henry Fox, first baron, secretary of state to George II. H. was born at Winterslow House, Wilts, in 1773, and succeeded to the title on the death of his father, the second baron, in 1774. He went to Eton, and thence to Christ Church. He was trained for public life by his celebrated uncle, Charles James Fox, and made his first speech in the House of Lords in January 1798. After the death of Mr Fox, H. held the post of lord privy seal in the Grenville ministry for a few months. He then shared the long banishment of the Whigs from the councils of their sovereign. During this long and dreary interval, H., to use the language of Macaulay (who has paid an eloquent tribute to his memory), was the ‘constant protector of all oppressed races and persecuted sects.’ He held unpopular opinions in regard to the war with France, and signed a protest against the detention of Napoleon at St Helena. On the other hand, he laboured to ameliorate the severity of the criminal code; made manful war, though a West India planter, on the slave trade; threw his whole heart, though a landowner, into the struggle against the Corn Laws; and although by rank and breeding an aristocrat, laboured incessantly to extend and confirm

the rights and liberties of the subject. In 1830, he became chancellor of the duchy of Lancaster, and a member of the reform cabinet of Earl Grey, and these posts he also held in the Melbourne ministry. He died at Holland House, Kensington, October 22, 1840. In his ample person and expressive features, he resembled his celebrated uncle.

HOLLAND, a name frequently applied to the kingdom of the Netherlands (q. v.), although in the strictest sense it is applicable only to the provinces of North and South Holland (q. v.).

HOLLAND, NEW, the name formerly applied to the island or continent of Australia (q. v.).

HOLLAND, PARTS OF. See LINCOLNSHIRE.

HOLLAND, NORTH, a province of the kingdom of the Netherlands, lying between 52° 10' and 53° 18' N. lat., and 4° 30' and 5° 20' E. long. Area, 955'66 square miles, and population (1861), 524,336. North H. consists of a peninsula joined to the mainland at its southern extremity, and of the islands of Wieringen, Texel, and Vlieland, lying at its northern extremity. It is bounded on the W. by the German Ocean, and on the E. by the Zuider Zee. The surface is marshy, and in many places lies below the level of the sea, from whose encroachments it is protected by enormous dykes, while canals intersect and drain it in every direction. The principal river is the Amstel, at the mouth of which is situated Amsterdam (q. v.). The most considerable of the many canals is the Grand Ship Canal. See AMSTERDAM.

The Haarlem Lake (q. v.), which once formed so remarkable a feature of the country, has been drained and converted into productive lands, but there still exist various small lakes or ponds in the marshy districts. The chief towns of the province are Amsterdam, Haarlem, Alkmaar, Zaandam or Saardam (q. v.).

HOLLAND, SOUTH, a province of the kingdom of the Netherlands, lying between 51° 45' and 52° 20' N. lat., and 3° 50' and 5° 10' E. long. Area, 1162 square miles, and population (1861), 626,262. It is bounded on the N. by North Holland, E. by Utrecht and Gelderland, S. by the Maas, which separates it from Zeeland and North Brabant, and W. by the German Ocean. South H. comprises the land around the embouchures of the Rhine and Maas, which is cut up in its southern portions into several islands—viz., Voorne, Overflackkee, and Goeree, Putten, Ysselmonde, Beijerland, &c.

The country is flat and low, and is broken by no elevation beyond the downs, which protect it from the sea. Streams and canals intersect it in all directions, and it abounds with lakes and with *polders*, or lands that have been recovered from the sea or lakes by draining. One of the most noted of these is the Biesbosch, land recovered from a marshy lake which was formed by the terrible inundation of 1421. The chief rivers are the Old Rhine, the Issel, Lek, Maas, and Mervede. The principal towns of South H. are the Hague, Leyden, Rotterdam, Dort, Gorkum, Brielle, and Gouda (q. v.). The two provinces of Holland rank among the most populous districts of Europe, and their inhabitants are distinguished for indefatigable industry and habits of excessive cleanliness. The rearing of cattle, of which there are upwards of a million in North and South Holland, and the preparation of butter and cheese, constitute the principal sources of industry in the rural districts. Alkmaar in North Holland, and Gouda in South H., are the great centres of the cheese-trade. The provinces of Holland enjoy the largest share of the national commerce and wealth.

HOLLAND, SIR HENRY, Bart., M.D., F.R.S., an eminent living physician, born at Knutsford, Cheshire, in 1788. He received his professional education in London, and subsequently at the university of Edinburgh, where he graduated as M.D. in 1811. He then spent two or three years in the east of Europe; and in 1815, after his return to England, published his *Travels in Albania, Thessaly, &c.*, in a 4to volume. Settling in London as a physician, he soon became eminent in the profession of which he is now one of the recognised heads. In 1828, he was elected a Fellow of the Royal College of Physicians, a distinction at that time very rarely conferred upon a Scottish M.D. In 1840, he was appointed physician-in-ordinary to the Prince Consort, and in 1852, physician-in-ordinary to the Queen. In the following year, he was made a baronet. In 1856, the university of Oxford conferred on him the honorary degree of D.C.L., and he has likewise received the degree of LL.D. from the university of Cambridge, Massachusetts. In 1840, he published a volume entitled *Medical Notes and Reflections*, consisting of 34 essays upon various of the most interesting departments of medicine and psychology, which has passed through several editions. In 1852, his *Chapters on Mental Physiology* appeared, which are expansions of those essays in his former work which treated of 'that particular part of human physiology which comprises the reciprocal actions and relations of mental and bodily phenomena.' His *Essays on Scientific Subjects*, published in 1862, and embracing the consideration of many of the most profound subjects in the wide domain of physics, shew that if his special studies had taken a different direction, he would have attained as great a fame as a natural philosopher as he now enjoys as a physician.

HOLLANDS. See GIN.

HOLLOW-WARE. A trade term, applied to such common iron utensils as are hollow, such as caldrons, sauce-pans, kettles, &c.

HOLLY (*Ilex*), a genus of trees and shrubs of the natural order *Aquifoliaceae*, chiefly natives of temperate climates; with evergreen, leathery, shining, and generally spinous leaves; small flowers which have a 4–5-toothed calyx, a wheel-shaped 4–5-cleft corolla, 4 or 5 stamens, and the fruit globose and fleshy, with 4 or 5 stones (*nuts*). The COMMON H. (*I. aquifolium*), the only European species, and a native also of some parts of Asia, is a well-known ornament of woods, parks, and shrubberies in Britain, the stiffness of its habit being so compensated by the abundance of its branchlets and leaves, as to make it one of our most beautiful evergreens. It is found as a native plant in Scotland, although Britain is nearly its northern limit; and it attains a greater size and displays greater luxuriance in the northern than in the southern parts of its geographic range, often appearing in the former as a tree of considerable size, 20 to 50 feet high, whilst in the latter it is generally a mere bush. It prefers light soils. There are numerous varieties of H., produced, or at least perpetuated by cultivation, exhibiting great diversity in the leaves, of which the *Hedgehog H.* may be mentioned as extremely sinuous and spinous, whilst others are prized for their colour, golden, silver-blotched, &c. The flowers of the H. are whitish, axillary, nearly umbellate; the fruit small, scarlet, rarely yellow or white. The abundance of the fruit adds much to the ornamental character of the tree in winter, and affords food for birds; but to man it is purgative, emetic, and diuretic, and in larger quantities poisonous. The leaves are inodorous, have a mucilaginous bitter

and somewhat austere taste, and have been used medicinally in cases of gout and rheumatism, as a diaphoretic, and also as an astringent and tonic to correct a tendency to diarrhoea, &c. The leaves and small branches, chopped, are sometimes used for feeding sheep in severe winters. The root and bark are emollient, expectorant, and diuretic. Bird-lime (q. v.) is made from the inner bark. The wood is almost as white as ivory, very hard and fine-grained, and is used by cabinet-makers, turners, musical instrument-makers, &c., and sometimes for wood-engraving. Handles of tools and handles of metal tea-pots are very often made of it. The H. is often planted for hedges, as it bears clipping well, and makes an excellent fence. A H. hedge may either be kept low, or, as is the case at Tynningham, in East Lothian, allowed to grow to the height of 20 or 30 feet. In the gardening of former days, hollies were often clipped into fantastic shapes. The name H. is said to be derived from the use of the branches and berries to decorate churches at Christmas, from which the tree was called Holy Tree.—Numerous other species of H. are found in North America, most of them in swampy situations, in South America, Nepal, Japan, and other parts of the world; some of which have now become not unfrequent ornamental trees and shrubs in Britain.—*MATÉ* (q. v.), or *Paraguay Tea*, is the leaf of a South American species of H. (*I. Paraguensis*).

HOLLY SPRINGS, a village in Northern Mississippi, United States, America, on the Central Railway, 25 miles south of its junction with the Memphis and Charleston line. It is the principal town in Northern Mississippi, and contains several churches, four academies, a bank, and two or three newspapers, with a large trade in cotton and merchandise. Pop. about 4500.

HOLLYHOCK (*Althæa rosea*), a plant of the natural order *Malvaceæ*, commonly referred to the same genus with the Marsh Mallow (q. v.). It has a tall, straight, hairy stem; heart-shaped, crenate, wrinkled, 5–7-angled leaves, and large axillary flowers almost without stalks; the leaves diminishing into bracts, and the upper part of the stem forming a spike; the petals hairy at the base. The H. is a native of India, the south of Europe, &c., is to be seen in almost every garden in India, and has been much cultivated in gardens in Britain from a very early period. At present, it is a favourite flower, and varieties, the result of cultivation, are very numerous. It varies much in the colour of the flowers, and double and semi-double varieties are common. It is an autumnal flower, continuing till the frost sets in. It is a biennial or perennial plant. The stem rises to a height of 8–15 feet, unbranching, or nearly so. The fibres of the plant have been made into yarn, but it is not yet certain if it is really valuable for cultivation on this account, or for the manufacture of paper. It is not improbable that it might be cultivated with advantage to afford green fodder for cattle, which are very fond of its leaves, and the leaves are produced in great abundance if the plant is prevented from flowering. The flowers are mucilaginous and demulcent, and are sometimes used like those of mallows and marsh mallows. The leaves yield a fine blue dye.—The **CHINESE H.** (*A. Chinensis*) is an allied species.

HOLMES, OLIVER WENDALL, M.D., an American physician and author, was born at Cambridge, Massachusetts, August 29, 1809. In 1829, he graduated at Harvard College, and entered upon the study of law, but soon adopted his father's profession—medicine. He studied in Europe, graduated as doctor of medicine in 1836, and two years after

was appointed professor of anatomy and physiology in Dartmouth College; and in 1847, was transferred to the same chair at Harvard, the medical department of which is at Boston, where he has since resided. Dr H. is not only a man of science, but a humorous and satirical poet of much ability. Several of his lyrics also are among the most exquisite produced in America. Most of his poems have been delivered before college literary societies, as *Poetry, a Metrical Essay; Terpsichore; Urania; and Astrea*. In 1857 he contributed his *Autocrat of the Breakfast Table*, a connected series of prose essays, to the *Atlantic Monthly*, which was followed by *The Professor at the Breakfast Table*, which has the added interest of a story. His last work is the singular romance entitled *Elsie Venner* (1861). Dr H. is also one of the most popular of public lecturers. Of medical writings may be mentioned three, *Boyleston Prize Dissertations, Lectures on Homoeopathy and its Kindred Delusions, a Report on Medical Literature*, besides many articles in professional periodicals. His various works combine wit, humour, poetry, science, and philosophy.

HOLOCANTHUS, a genus of fishes, of the family *Chatodontidæ* (q. v.), remarkable for the great beauty and symmetry of their colours, and for their excellence as articles of food. They have the very compressed form and other general characters of the *Chatodontidæ*, a single dorsal fin, and a large spine on the gill-cover. They are natives of the seas of warm climates. *H. imperator* is one of the most esteemed fishes of the East Indies, rivalling the salmon in flavour. Its greatest size is about 15 inches long; its colour is deep blue, with numerous narrow bands of orange, the pectoral fins black, the tail bright yellow. It is known in some parts of the East as the *Emperor of Japan*.

HO'LOCAUST. See **SACRIFICE**.

HOLOFERNES. See **JUDITH**.

HOLOGRAPH (Gr. *holos*, all, and *graphie*, writing), deed or writing, in Scotch Law, means a writing in which the author or maker does his own penmanship. Considerable privileges are given to this species of writing, whereas, in England and Ireland, it is in general utterly immaterial whose penmanship is used, provided the party sign or seal the writing or deed. In Scotland, if a person execute his will or a deed in holograph, this dispenses with the usual formalities which would be requisite if he merely signed a paper written by another hand, for no witnesses are required to attest holograph deeds or testaments. If the handwriting, however, is disputed, evidence must be given as to whose handwriting it is. In England, it is quite immaterial whether a person writes out his own will or not; in either case there must be two witnesses. So in the case of holograph missive writings and accounts, there is a difference as to the period of prescription applicable in Scotland, but in England there is no distinction merely on this ground. The distinction between holograph and other deeds also prevails in the law of France and other continental countries.

HOLOPTY'CHIUS (*holos*, all, and *ptychê*, wrinkle), a remarkable genus of fossil ganoid fishes, so named from the wrinkled appearance of the enamelled scales. They were of large size, some species probably reaching the length of 12 feet. The small head was covered with large tuberculated plates, like those of the crocodile, and the body was completely encased in large scales, more like those of a reptile than a fish. Some scales have been found measuring 3 inches in length by 2½ in breadth, and a full eighth of an inch in thickness. They were composed internally of porous

bone, in numerous layers, arranged alternately at right angles to each other, and the outside was covered with a bright glossy corrugated enamel. The spines of the fins were large and hollow; the bones were partially ossified; the centre remained in its original cartilaginous condition, and consequently appears hollow in the fossil. The jaws were covered with hard enamel instead of skin, and were furnished with a double row of teeth; the outer row, placed along the edge of the mouth, were small and thickly set; the inner range were widely set, and very large, at least twenty times the bulk of the others. The specimen figured was obtained at

Holoptychius Nobilissimus (Agass.).

Clashbennie, on the Firth of Tay, by Mr Noble; it now forms part of the British Museum collection. It is a foot across by two feet and a half long without the tail, which is wanting. It is nearly perfect, lying on its back, with the scales and the ventral fins in their original position.

The genus is peculiar to the Old Red Sandstone and Carboniferous Measures; eight species being found in the former, and nine in the latter. It has been proposed to confine the name *Holoptychius* to the fossils of the Old Red Sandstone, and to give that of *Rhizodus*, which Owen applied to the teeth remains before their connection with the fish was known, to the *Holoptychians* of the Coal Measures, which have the outer row of teeth more robust and obtuse, and the inner set longer, sharper, and more slender than in the older species.

HOLOTHURIA, a genus of *Echinodermata*

Holothuria:

a, *H. phantapus*; b, buccal appendages of *H. phantapus*; c, *H. papillosa*; d, an isolated branch of the buccal appendages of *H. papillosa*; e, *H. cucumis*; f, *H. vittata*.

(q. v.), the former limits of which are now those of a family, *Holothuridae*, divided into numerous genera.

SEA-SLUG and SEA-CUCUMBER are popular names of some of the animals of this family. The *Holothuridae* have not the covering of calcareous plates characteristic of the more typical *Echinodermata*, but a soft leathery muscular integument, very irritable, and capable of great distention and contraction. Some of them are almost globose, some so much elongated as to be almost worm-like; but the same individual is often capable of extending itself to several times the length which it has in a state of repose. In locomotion, the body is extended and contracted as by the annelides, but the principal organs of locomotion, as in star-fishes and sea-urchins, are suckers or *Ambulacra* (q. v.), of which there are usually five double rows, whilst sometimes they are distributed over the whole surface of the body; but some of the species have the suckers developed only on a disc, and the body then presents an upper and an under surface. The radiate structure is most apparent in the mouth, which is surrounded with tentacles, in number always a multiple of five, exhibiting great variety of beautiful forms, and capable of being completely retracted. Little is known of the food of the *Holothuridae*, which, however, probably consists of small marine animals.

Within the opening of the mouth there is a circle of teeth. There is no proper stomach. The intestine is often very complicated. The respiratory organs are near the anus, and consist of branching tubes. The organs of both sexes are found in each individual. The young pass through several stages or transformations, in which they are very unlike their parents; in their first stage, after leaving the egg, they swim vigorously by means of membranous expansions of the body. The *Holothuridae* are capable of the most extraordinary reproduction of parts, even of the most important organs. They are found in all seas, but particularly abound in the Red Sea, and between the south of Asia and Australia. The largest European species, *H. (Cucumaria) frondosa*, occasionally found in the British seas, is about a foot in length, and capable of extending itself to three feet. Most of the British species are small, and they are not of a pleasing appearance as they usually come under observation, although the expanded tentacles give them beauty in their proper abodes. But many of the tropical species exhibit splendid colours, and are among the creatures which make the bottom of the sea, particularly among coral reefs and islands, gay and lovely as a garden.

The *Bêche-de-mer* (q. v.), or Trepang, so much esteemed as a delicacy by the Chinese, belongs to this family.

HOLSTEIN, a duchy of Northern Germany, belonging to the kingdom of Denmark, and at the same time a member of the Germanic Confederation. It is separated from Slesvig on the N. by the river Eyder and the Slesvig-Holstein Canal; is bounded on the E. by the Baltic Sea, the territory of Lübeck, and the duchy of Lauenburg; on the S. by the Hamburg territory and the river Elbe, which separates it from Hanover; and on the W. by the North Sea. Area, 3270 square miles; pop. 544,419. The principal rivers, besides the Elbe and the Eyder, are the Stör and the Trave. Of the surface of the land, one-eighth consists of marshes. The central districts of the province are occupied by an undulating plain, varied by low hills, and traversed from north to south by a heathy and sandy ridge, from which the land falls away gradually on the east—where the surface is varied by lakes and fertile well-wooded valleys—and on the west. The soil, with the exception of several

tracts of sand and heath, is very fruitful, and is most luxuriant in the marshes. The climate and natural productions closely resemble those of similar districts in the north of Germany. Salt and lime are the only minerals found. Amber is obtained on the eastern coast, and the interior abounds in peat. The manufactures of H. are inconsiderable; agriculture and the rearing of cattle are the chief employments of the people. The history of H. and its political relations are noticed in the article SLESVIG.

HOLSTERS, cases for pistols affixed to the pommel of a saddle. They are frequently covered with wool or fur, to prevent injury to the rider in the event of his being thrown forward upon them.

HOLY ALLIANCE, a league formed after the fall of Napoleon by the sovereigns of Russia, Austria, and Prussia, nominally to regulate the relations of the states of Christendom by the principles of Christian charity, but really to preserve the power and influence of the existing dynasties. Most of the other European rulers acceded to it, and the treaty was formally made public in the *Frankfurt Journal*, February 2, 1816. It was in virtue of this league that Austria, in 1821, crushed the revolutions in Naples and Piedmont, and that France, in 1823, restored absolutism in Spain. Subsequently, both France and England seceded, after which it became a mere *nomini umbra*. A special article of the treaty excluded for ever the members of the Bonaparte family from any European throne!

HOLY COAT, a relic preserved with the greatest reverence in the cathedral of Treves, of which city it is esteemed the greatest treasure. It is alleged to be the seamless coat of our Saviour, and to have been discovered in the 4th c. by the Empress Helena, in her memorable visit to Palestine, and by her deposited at Treves. The Treves relics were

did not take place again till 1512, when multitudes flocking to see and venerate it, Leo X. appointed it to be exhibited every seven years. The Reformation and wars prevented the regular observance of this great religious festival; but it was celebrated in 1810, and was attended by a concourse of no fewer than 227,000 persons; and in 1844 by still greater multitudes, whilst miraculous cures were confidently asserted to be performed by the precious relic. The exhibition of the Holy Coat in 1844 is otherwise memorable for the reaction which it produced, leading to the secession of Rongé and the German Catholics from the Church of Rome.—For further information see *The Book of Days*, published by W. & R. Chambers.

HOLY FAMILY, the name given, in the language of art, to every representation of the infant Saviour and his attendants. In the early part of the middle ages, when the object in view was to excite devotion, the Virgin and Child were usually the only persons represented. At a later period, Joseph, Elizabeth, St Anna (the mother of the Virgin), and John the Baptist, were included. Some of the old German painters have added the twelve apostles as children and playfellows of the infant Christ, as well as their mothers, as stated in the legends. The Italian school, with its fine feeling for composition, was the first to recognise how many figures the group must consist, if the interest is to remain undivided, and be concentrated on one figure, whether that figure be the Madonna or the Child. Two masters are pre-eminent in this species of representation—Leonardo da Vinci and Raphael.

HOLY GHOST, or **HOLY SPIRIT**, in Orthodox Theology, the third person of the Trinity (q. v.), proceeding from the Father and the Son, yet of one substance, majesty, and glory with the Father and the Son, very and eternal God. His distinct personality is believed to be attested by a multitude of passages in Scripture, which it is unnecessary to quote. One may suffice: 'But when the Comforter is come, whom I will send unto you from the Father, even the Spirit of truth, which proceedeth from the Father, he shall testify of me' (John xv. 26). The 'Procession' (q. v.) of the Spirit is the subject of one of the chief differences between the Eastern and the Western or Latin Churches. He is essentially a spirit of holiness, and his grand function is to apply to the hearts of men the benefits of Christ's death, to work in them, first, a belief of the truth as it is in Jesus, and then to sanctify them by that truth.

HOLY GRASS (*Hierochloe borealis*), a grass about a foot high, with a brownish glossy lax panicle. It is found in the most northern parts of Britain, and in the north of Europe. It has a sweet smell, like that of vernal grass; and in Iceland, where it is plentiful, it is used for scenting apartments and clothes. In some countries, it is strewed on the floors of places of worship on festival-days, whence its name.

HOLY ISLAND, or **LINDISFA'RNE**, a small island of England, belonging to the county of Northumberland, and situated about ten miles south-east of Berwick-on-Tweed. It is about four miles long, and two miles broad, and is connected with the mainland by sands three miles in extent, which can be traversed at low-water by vehicles of all kinds. Pop. of parish, 614; but including the chapelries of Kyloe, Ancroft, and Tweedmouth, all in the ancient parish, and called *Islandshire*—4049. On the south coast is the village of Holy Island, finely situated, and now much resorted to by summer visitors. On the island are several ruins, the chief of which are the extensive and

The Holy Coat of Treves.

concealed from the Normans in the 9th c. in crypts; but the Holy Coat was rediscovered in 1196, and then solemnly exhibited to the public gaze, which

sombre-looking remains of the famous Abbey of Lindisfarne, originally a Saxon edifice; there is also an ancient castle, now fortified and occupied by a party of artillery. In former times, H. I. was the seat of a bishopric.

HOLY LAND. See PALESTINE.

HOLY PHIAL, or **SAINTE AMPOULE**, ORDER OF, the name of an order of knighthood which formerly existed in France, and was composed of four persons, usually the first in point of rank, family, and fortune in the province of Champagne, and styled *Barons de la Sainte Ampoule*. At the coronation of the French kings, they were delivered to the Dean, Priors, and Chapter of Rheims, as hostages for the fulfilment of the engagements entered into by the great officers of the crown to return the holy phial in which the coronation oil was kept, and which, according to the legend, was brought from heaven by the Holy Ghost under the form of a dove, and put into the hands of St Remy at the coronation of Clovis—an enormous crowd having prevented the messenger from bringing in time that which had already been prepared. The peculiarity of this order was that the knights were only knights for a day. Their badge was a cross of gold enamelled white, cantoned with four fleur-de-lis, and on the cross a dove descending with a phial in its beak, and a right hand receiving it.

HOLY PLACES, HOLY SEPULCHRE. Under the head JERUSALEM (q. v.) are enumerated many localities which, from the memories associated with them, must be full of solemn interest for every religious mind; but the name Holy Places of Jerusalem more strictly designates the group of sacred places of which the Church of the Holy Sepulchre is the centre, and which are supposed to comprise the sites of the chief events of our Lord's passion, death, and burial: Gethsemane, the Supper-room, the Church of the Ascension, the Tomb of the Virgin, &c.

In the article JERUSALEM, the general topography of the ancient and modern city is briefly described. The so-called Church of the Holy Sepulchre stands within the modern city, on the north-western or Latin quarter. It is a Byzantine building, in the centre of a spacious enclosed court. Under the great dome of the church stands the Holy Sepulchre, which is of an oblong form, fifteen feet by ten, and is surmounted by a rich ceiling, decorated with gold, silver, and precious marble. A circular hall surrounds the space beneath the dome. Around this circular hall are oratories for the Syrians, Copts, and Maronites; and above it is a series of galleries, which are similarly appropriated. In the body of the church are the chapels of the Greek, Latin, and Armenian Christians, the church as a whole being maintained by the Ottoman authorities in the condition, as it were, of a common meeting-ground for all the Christian communions, as the rivalries of the several religious bodies constantly lead to angry controversy, and not unfrequently to sanguinary conflicts. Opposite the entrance of the enclosure is a somewhat elevated marble slab, which is called the Stone of Unction, and is shewn as the stone on which our Lord's body was anointed before entombment; and above is an elevation approached by steps, which is the traditionary Mount Calvary, and on which now stands a rich dome-shaped building, floored with rich marbles, in the crypt of which is the cavity supposed to have been formed by the erection of the cross. The street by which this site is approached, from the direction of the ruins of Herod's palace, on the north side of the city, is the principal street

of the Latin quarter, and is called by the Turks *Harât-el-Albam*, and by the Christians the *Via Dolorosa*, as being the supposed route of our Lord from the hall of judgment to Calvary.

Such is the traditional view as to the locality, not only of these leading events of our Lord's history, but also of many others of minor importance, and less prominently noticeable. For a long course of ages, the Christian world unhesitatingly acquiesced in this view of the topography of the Holy Places; but since the beginning of last century, doubts have been entertained as to its correctness; and in late years, the question has been discussed with much learning, although with little positive, or at least conclusive result. About the year 1730, a German, named Korte, who had visited Jerusalem, and explored the locality, published a work, calling the authenticity of the received system of sacred topography into question. The doubts expressed by him have been repeated at intervals ever since his day, and especially by the celebrated American critic, Dr Robinson, author of *Biblical Researches in Palestine*, who may be said, in two successive investigations, to have exhausted the evidence, on one side of the question, at least so far as the remains of the ancient city had at that time been explored. Dr Robinson distinctly affirms the impossibility of reconciling the received sacred localities with the plain requirements of the gospel history; but he fails himself to point out a scheme of topography which may be substituted for that which has been traditionally received. More recent critics, and especially Mr James Ferguson, in an *Essay on the Ancient Topography of Jerusalem*, agreeing with Dr Robinson in rejecting the received topography, contends against him that the true site of the Holy Sepulchre can be accurately determined, and that it is no other than the Mosque of Omar, or, as the Mohammedans call it, the 'Dome of the Rock.' This he holds to be the identical church which Constantine erected over the rock which contained the tomb of our Lord. The latest biblical traveller in Palestine, Dr Stanley, has left the question undecided. It is beyond the scope of this work to discuss such a subject. We can but refer the reader to the chief authorities on each side of the controversy. It is one upon which future explorers may throw much light by skilful and judiciously conducted excavations. The works at present about to be undertaken under the authority of the Russian government are looked to with much interest. See, on the one side, Robinson's *Biblical Researches in Palestine*, Smith's *Dictionary of the Bible*, article 'Jerusalem' (Ferguson); *Essay on the Ancient Topography of Jerusalem*, by the same author. On the other, Williams's *Holy City*, Raumer's *Beiträge zur Bibl. Geographie*, Sepp's *Forschungen eines Deutschen Reisenden in Jerusalem*, Schaffter's *Aechte Lage des heiligen Grabes*.

HOLY SEPULCHRE, KNIGHTS OF THE, an order of knighthood instituted, probably by Pope Alexander VI., for the guardianship of the Holy Sepulchre, and the relief and protection of pilgrims. The pope was originally the grand-master, but he subsequently ceded his rights to the Guardian Father of the Holy Sepulchre. The knights must, by the rules of the order, be all of noble descent; they were bound to hear mass daily, to fight, to live, and to die for the Christian faith, &c. In return for these duties, the knights had the most unusual and extraordinary privileges conferred on them: they were exempt from taxation, could marry, and yet possess church property, legitimise bastards, and cut down and bury the bodies of criminals who had been hanged. On the recapture of Jerusalem by the Turks, the knights retired to Italy, and settled

at Perugia. After a temporary union with the Hospitallers, the order was reconstructed in 1814 both in France and in Poland, and is still in existence within a very small circle of knights elected by the Guardian Father from the most respectable pilgrims who come to Jerusalem.

HOLY WATER, in the Roman Catholic, as also in the Greek, Russian, and Oriental churches, signifies water blessed by a priest or bishop for certain religious uses. Water is, almost of its own nature, a fitting symbol of purity; and accordingly, in most of the ancient religions, the use of lustral or purifying water not only formed part of the public worship, but also entered largely into the personal acts of sanctification prescribed to individuals. The Jewish law contained many provisions to the same effect; and our Lord, by establishing baptism with water as the necessary form of initiation into the religion instituted by him, gave his sanction to the use, which, from its universal acceptance among mankind, appears to be a relic of the primeval natural revelation. The usage of sprinkling the hands and face with water before entering the sanctuary, which was prescribed in the Jewish law, was retained, or at least very early adopted, in the Christian church. It is expressly mentioned by Tertullian in the end of the 2d century. And that the water so employed was blessed by the priests we learn, among others, from St Jerome, and from the apostolical constitutions. Although it is difficult to fix the precise time, it cannot be doubted that the practice of mingling salt with the water is of very ancient origin (see Canon 20, *De Consecr. Dist. iii.*). In the Western Church, there is a solemn blessing of water in the service of Holy Saturday, but the ceremonial is repeated by the priest whenever it may be necessary to replenish the fountain. Instructed Catholics regard the use of holy water chiefly as a means of suggesting to the mind the necessity of internal purity; and although it is supposed to derive from the blessing a special efficacy for this end, yet this efficacy is held to be mainly subjective and of a character entirely distinct from that ascribed to the sacramental rites of the church. In the reformed churches, the use of holy water is regarded as unscriptural and superstitious.

HOLY WEEK, the week immediately preceding Easter, and specially consecrated to the commemoration of the Passion of our Redeemer. In English use, it is also called 'Passion Week' (a name appropriated, in Roman use, to the week before Palm Sunday). This institution is of very early origin, and the name Holy Week is but one of many by which its sacred character has been described. It was also called the 'Great Week,' the 'Silent Week,' the 'Week of the Holy Passion,' the 'Vacant Week,' the 'Penitential Week.' In the Roman Catholic Church, the special characteristics of the celebration of the Holy Week are increased solemnity and gloom, penitential rigour, and mourning. If any of the ordinary church festivals fall therein, it is transferred till after Easter. All instrumental music is suspended in the churches, the altars are stripped of their ornaments, the pictures and statues are veiled from public sight; manual labour, although it is no longer entirely prohibited, is by many persons voluntarily suspended; the rigour of fasting is redoubled, and alms-deeds and other works of mercy sedulously enjoined and practised. All church services of the week, moreover, breathe the spirit of mourning, some of them being specially devoted to the commemoration of particular scenes in the Passion of our Lord. The days thus specially solemnised are Palm Sunday, Spy Wednesday, Holy

(or Maundy) Thursday, Good Friday (q. v.), Holy Saturday. Holy Thursday (called also Maundy Thursday, from *Mandatum*, the first word in one of the church services of the day), in the Roman Catholic Church, is specially designed as a commemoration of the Last Supper, and of the institution of the Eucharist. But there are several other services annexed to the day, as the solemn consecration of the oil or chrism used in baptism, confirmation, orders, and extreme unction, the washing of pilgrims' feet, and the tenebræ. To Holy Saturday belongs the solemn blessing of fire and of the water of the baptismal font; and from the earliest times, it was set apart for the baptism of catechumens, and for the ordination of candidates for the ecclesiastical ministry. From the fire solemnly blessed on this day is lighted the Paschal Light, which is regarded as a symbol of Christ risen from the dead. This symbolical light is kept burning during the reading of the gospel at mass throughout the interval between Easter and Pentecost. See Wetser's *Kirchen-Lexicon*, art. 'Charwoche.' It must be added, however, that in many instances the primitive institution of the Holy Week was perverted, and that the suspension of labour, which was originally designed for purposes of devotion and recollection, was turned into an occasion of amusement not unfrequently of a very questionable character. Such abuses are now universally discountenanced by the ecclesiastical authorities.

In the Protestant communions, there is no special solemnisation of the Holy Week, with the exception of Good Friday (q. v.), which is observed in some of them.

HOLYHEAD, a seaport, parliamentary borough, and market-town of North Wales, in the county of Anglesea, is situated on a small island of the same name, 24½ miles west-north-west of Bangor, and 272 miles north-west of London. Although recently much improved, it is still a primitive, irregularly built town. It is the station of the mail steam-packets to Dublin, from which it is distant about 69 miles. The harbour of H., which is almost dry at low tide, is formed by a pier about 1000 feet in length, running north-east from an islet called Salt Island, which is connected with the mainland by a swivel-bridge. Few manufactures are carried on here. Pop. (1861) 6190, who are employed in the coasting-trade, and in ship-building and rope-making. The harbour of refuge now (1862) being constructed here, will, when completed, enclose an area of about 316 acres, with a depth of upwards of six fathoms. H. unites with Amlwch, Beaumaris, and Llangefni in sending a member to the House of Commons.

HOLYHEAD ISLAND, a small island of North Wales, lies west of the island of Anglesea, and forms part of the county of that name. Its greatest length is seven and a half miles, and its greatest breadth about three and a half miles. Area, about 6000 square acres; pop. 8868. H. I. is separated from Anglesea by a narrow sandy strait crossed by the Holyhead Road and the Chester and Holyhead Railway, which are formed by embankments or causeways, arched in the centre, to admit of the passage of the water. The island, which comprises some good pasture-ground for sheep, as well as a proportion of arable land, is for the most part rocky and barren. On the north-west coast are two islets, the North and South Stacks, the latter with a light-house, the light of which is visible at twenty miles' distance. The South Stack is connected with the island of H. by a suspension-bridge. The Stacks and the north coast of the island of H. are

hollowed out by the action of the sea into magnificent caves, which are the haunt of innumerable sea-fowl. Principal town, Holyhead (q. v.).

HO'LYROOD. In the year 1128, King David I. of Scotland founded at Edinburgh an abbey of canons regular, of the order of St Augustine. It was dedicated in honour of the Holy Cross or Rood, which was brought to Scotland by St Margaret about the year 1070, and became one of the heirlooms of the kingdom. The **BLACK ROOD OF SCOTLAND** (q. v.), as it was called, fell into the hands of the English at the battle of Neville's Cross in 1346, and as its history passed from remembrance, a fable sprung up telling how King David was prevailed upon by his young nobles to go a hunting on the solemn festival, by which the church yearly commemorated the finding of the Holy Cross at Jerusalem; how the chase lay through the forest, which in those days encircled Arthur Seat, and stretched almost to the gates of Edinburgh; how the king, in pursuit of a wild hart, outrode all his companions; how at the foot of Salisbury Crags the hart turned to bay, and overthrew the king's horse; how as it rushed at the king, threatening him with instant death, a cross, as if from between its antlers, miraculously slid into the king's hands; how at the sight of it the hart fled and vanished; and how the king, warned by a vision in his sleep, resolved to build a monastery in honour of the Holy Rood on the spot where his life had been so preternaturally saved. When this legend was invented, apparently about the year 1420, it had been forgotten that the first site of the abbey was not at the foot of Salisbury Crags, but within the walls of the castle, whence it was not finally removed until after the year 1174, to the eastern extremity of the Canongate, as the little burgh came to be called, which the canons erected between their abbey and the king's burgh of Edinburgh. The abbey was burned by the English in 1385, in 1544, and in 1547. Before it could be restored after these last conflagrations, the Reformation arrived, when the ruins of the choir and transepts were taken down to repair the nave. This was used as the parish church of the Canongate from about 1560 till 1672, when it was turned into the chapel-royal. In 1687, King James VII., having built another parish church for the Canongate, set the nave of the abbey church apart for the Roman Catholic service, and had it fitted up with stalls for the Knights of the Thistle. It was plundered and burned by the mob at the Revolution in 1688, and remained in neglect until 1758. In that year it was repaired and roofed, but the roof was too heavy for the walls, and it fell in 1768, crushing the pillars of the north aisle, and otherwise injuring the building.

The abbey of H. early became the occasional abode of the Scottish kings. John Balliol held a parliament within its walls in 1295. James II. was born in it, crowned in it, married in it, buried in it. The foundations of a palace, apart from the abbey, were laid by James IV., whose splendid nuptials with the Princess Margaret of England were celebrated here in 1503. Edinburgh had now become the acknowledged capital of Scotland, and H. henceforth was the chief seat of the Scottish sovereigns. Queen Mary took up her abode in the palace when she returned from France in 1561. Here, in 1566, Rizzio was torn from her side, and murdered. Her son, King James VI., dwelt much in H. before his accession to the throne of England in 1603. He revisited it in 1617. It was garrisoned by Cromwell's troops after the battle of Dunbar in 1650, when the greater part of it was burned down. It was rebuilt by King Charles II., from the designs of Sir William Bruce of Kinross, between

1671 and 1679. In 1745 and 1746, it was occupied in succession by Prince Charles Edward, and by the Duke of Cumberland. It sheltered the Count d'Artois (afterwards King Charles X. of France) from 1795 to 1799, and again from 1831 to 1835. King George IV. held his court in it in 1822. Since that time much has been done to make it a suitable residence for the sovereign, and for a good many years the Queen has visited it almost every summer.

The oldest part of the palace is the north-west tower, founded by King James IV. about 1500, and completed by his son, King James V., who died in 1542. It was somewhat modernised in 1671—1679; and the roofs, if not the floors also, were renewed by King Charles I. (1625—1649), whose cipher they bear; but otherwise the disposition of the rooms seems to be much the same as in the days of Queen Mary. It need scarcely be added, that the furniture is much more recent, and that the articles shewn as relics of Mary and her court are wholly spurious.

The palace, with its precincts and park, is a sanctuary for debtors. In England, the same privilege extends to royal palaces to this extent, that no writ of legal process can be executed within their bounds; but this practically is only a protection to the servants of the palace; and no means exist for insolvent persons taking lodgings in a privileged place there or elsewhere, and avoiding imprisonment, in so systematic a way as is competent to residents within the precincts of Holyrood Palace, where there is ample accommodation. The precincts comprehend the adjoining park and the hills of Arthur's Seat and Salisbury Crags. Refugee debtors must procure a certificate of protection within twenty-four hours from the proper official within the bounds. Taking refuge within the sanctuary is considered disreputable, and from this cause, as well as from recent meliorations in the laws affecting debtors, the practice is greatly fallen off. It is to be added, that the sanctuary of Holyrood shelters debtors to the crown.

HO'LYWELL, a municipal and parliamentary borough, and market-town of North Wales, in the county of Flint, and $4\frac{1}{2}$ miles north-west of the town of that name, is situated on an eminence on the line of the Holyhead and Chester Railway, and near the south-western shore of the estuary of the Dee. It is the centre of an immensely valuable mineral district, and is the seat of numerous establishments for lead and copper smelting, manufacturing shot, zinc, &c. There are also manufactures of cottons, flannels, and galloons, paper, and Roman cement; coal and lead mines, and limestone quarries, are worked. This borough unites with those of Flint, Mold, &c., in returning a member to parliament. Pop. (1861) 5335. (1871—7961.)

H. is now one of the most important and flourishing towns of North Wales. It owes its origin to the renowned Well of St Winifred, which is estimated to deliver twenty-one tons of water per minute, and is said to be the most copious spring in Britain. Its waters were at one time believed to be efficacious in curing diseases, and were visited by great numbers of pilgrims.

HO'MAGE is the service or show of respect due from a knight or vassal to his lord in feudal times. The word is derived from the form of expression used in doing the service, which was—*jeo deveigne vostre home*—I become your man. Since the abolition of tenures, the word has no substantial legal meaning in the law of England, except in a limited sense as to copyholds, to denote the kind of acknowledgment made by a tenant to the lord of the manor. The homage jury consisted of the tenants who did

homage, and their presence was necessary to attest some acts. *Homagium reddere* was the expression, now obsolete, signifying a solemn renunciation of homage or fealty to the lord, and a defiance of him. The word homage is not used in Scotch law, though the feudal system is not obsolete in Scotland in many other respects.

HOMALOPTERA (Gr. level-winged), the name given by some entomologists to a small order of insects, which has been more generally regarded as a division of the order *Diptera*. The H. have also been called *PUPIPARA*, from the remarkable circumstance that the larvæ are hatched within the body of the mother, and remain there till they have passed into the pupa state. Some of the H. are wingless. Examples of this order are found in the Forest Fly (q. v.), and in those extraordinary parasites of bats called *Nycteribia*. All the H. are parasites.

HOMBURG VOR DER HÖHE, a pleasant little town, capital of the landgraviate of Hesse-Homburg (q. v.), is situated at the foot of the Taunus Mountains, nine miles north-west of Frankfurt-on-the-Maine. It has beautiful environs, and is much frequented on account of its mineral waters and gambling-saloons. The waters are considered very effective in cases of disordered liver and stomach. They are five in number, and one of them, the *Elizabeth*, contains more carbonic acid than any saline spa known. About 400,000 bottles of the 'waters' of H. are annually sent away. Pop. 5000.

HOME, HENRY (LORD KAMES), an eminent Scottish lawyer and author, was born in 1696 at Kames, in Berwickshire. Destined by his friends for the law, he was apprenticed in 1712 to a writer to the signet; but he afterwards decided on adopting the highest branch of his profession, and qualified himself for it mainly by private reading and attendance at the courts. Entering the bar in 1723, he was raised to the bench in February 1752, assuming the title of Lord Kames, and was made one of the Lords of Justiciary in 1763. He died 27th December 1782. In 1728, he published *Remarkable Decisions of the Court of Session from 1716 to 1728*. The materials of this work were in 1741 embodied in his *Dictionary of the Decisions of the Court of Session* during its whole history, which, though now superseded, was of great use to lawyers at the time, and was thought worthy of being continued by Lord Woodhouselee. He is best known, however, by his *Essays on the Principles of Morality and Natural Religion* (1751), containing a solution of the question of human freedom, which brought on him the suspicion of infidelity, and raised considerable controversy in the courts of the church and through the press; his *Introduction to the Art of Thinking* (1761); and above all, his celebrated *Principles of Criticism*, the work on which his fame now chiefly rests. In 1773 appeared his *Sketches of the History of Man*, which may be found entertaining, but are now of very little scientific value. Though thus busily occupied with judicial and literary labours, he took a very active interest in agriculture and commerce, and wrote a useful tract on the former, entitled *The Gentleman Farmer, being an Attempt to improve Agriculture by subjecting it to the Test of Rational Principles*. His last work, *Loose Thoughts on Education* (1781), was written in his 85th year. See Lord Woodhouselee's *Memoirs of the Life and Writings of Home* (2 vols. 4to, Edin. 1807).

HOME, JOHN, a Scotch clergyman and dramatist, was born in 1722. He studied for the church, and was appointed to the parish of Athelstaneford, where he wrote his tragedy of *Douglas*, which was

acted in Edinburgh, and received with the utmost enthusiasm. The production of this piece gave great offence to his clerical brethren, and he was finally compelled to retire from the ministry. He retired into England, where he obtained the protection of the Earl of Bute, and received a pension. His other dramatic works are *Agis*, *Aquileia*, *The Fatal Discovery*, and *Alonzo*, every line of which has departed from the memory of mankind. He died in 1808.

It is difficult now to understand the enthusiasm with which *Douglas* was first greeted. It was praised by men of all ranks, and Burns—who should have known better—talks of H. having

'Methodised wild Shakspeare into plan.'

This enthusiasm has departed long ago. Still *Douglas* contains pathos, and amid its florid declamation there may be found not a few natural touches, and it is on account of these that it still haunts the stage in a shadowy kind of way.

HOMELYN (*Raia miraletus* or *maculata*), a species of Ray (q. v.), common on the south coast of England, and plentiful in the London market,

Homelyn (*Raia maculata*).

but comparatively rare on the east coast of Scotland. In form and appearance, it more nearly resembles the thornback than the skate. On some parts of the British coast, the H. is called Sand Ray. It is also known as the Spotted Ray.

HOMER, the greatest name in the history of epic poetry, and who stands as high in that department as Shakspeare does in the drama, has come down to us in modern times unfortunately as little better than a name, and presents materials for biography as scanty as those which he offers for criticism are rich. We are not, however, forced to go to such lengths of doubt in his case as Aristotle did in the case of Orpheus, denying that such a man ever existed; for though the Germans, since the days of Heyne, Wolf, and Niebuhr, have indulged themselves in every variety of historical scepticism, and reduced H., as well as Cadmus and Hercules, to mere 'symbols,' the more sober genius of British criticism, with which the moderate views of the best later Germans coincide, has pronounced an almost unanimous verdict in favour of the historical reality of the author of the *Iliad* and the *Odyssey*. Not that any reliance is to be placed on the details of the old Greek lives of H., which are manifestly fictitious; but the internal evidence of the poems themselves leads to the belief in an authorship such as agrees substantially with the kernel from which these very ancient legendary traditions were developed. The central fact in which all

these traditions agree is, that the author of these poems was an Asiatic Greek; and though other places are named, the greatest amount of legendary evidence clearly points to Smyrna as the city which had the honour of giving birth to the father of epic poetry. The dialect in which the *Iliad* and *Odyssey* are written—the Ionic—is the very variety of Greek which was afterwards used in the same region by Herodotus, the father of History, and by Hippocrates, the first and greatest of Greek physicians; and the allusions to natural phenomena, especially the frequent mention of the strong north-west wind blowing from Thrace, plainly indicate the west coast of Asia Minor as the familiar residence of the poet. The chronology of the Homeric poems, both as respects the great central event which they celebrate—the Trojan war—and the age of the poet himself, is much more doubtful; but it is quite certain that H. lived considerably before the recognition of a regularly received record of dates among the Greeks—that is, before the year 776 B.C., the commencement of the calculation by Olympiads. The date given by Herodotus for the age of H.—400 years before his own time, that is, about 850 B.C.—is probable enough; but considering the entire want of any reliable foundation for chronology in those early times, we must not seek an accuracy in this matter beyond that which was attained by the Greeks themselves, and allow a free margin of at least 200 years from the time of Solomon (1000 B.C.) downwards, during which the singer of the *Iliad* and *Odyssey* may have flourished. To throw him further back than the earliest of these dates would be inconsistent at once with the historical elements in the midst of which his poems move, and with the style of the language which he uses; for this exhibits a luxurious freedom, a rich polish, and an exquisite euphony, which removes it far from that roughness and clumsiness which is wont to characterise languages in their earliest stage of literary development. The Ionic dialect used by H. is, in fact, a highly cultivated shoot of the old Hellenic stock, and which was in the poet's hands so perfect for the highest poetical purposes as to have remained the model for the epic style during the whole period of the poetical literature of the Greeks.

In endeavouring to form a correct estimate of the position of H. as a poet, the primary fact from which we must start is, that he was not the epic poet of a literary age—like Virgil among the Romans, Tasso among the Italians, or Milton among ourselves—but he was decidedly and characteristically an *aidos*, or *minstrel*, a character well known to us from our own medieval literature, both in other shapes, and specially as it has been presented to us by the kindred genius of Sir Walter Scott. That there is an essential and vital generic distinction between the popular minstrel of an age when books are either not known or little used, and the cultivated poet of an age which rejoices in all sorts of libraries, and possesses a special class of literary readers, admits of no doubt. The conditions of the work to be done being different, the work itself cannot possibly be the same. It is quite certain, however, that the great majority of the critics and translators of H. in this country have not recognised this distinction. The consequence is, that they strike an entirely false note, and blow the seraphic trump of Milton when they should be content to take a plain shepherd's pipe in their hands. These critics and translators are no doubt actuated by the very noble desire of redeeming the author of two such noble poems as the *Iliad* and the *Odyssey* from the vulgar fellowship of wandering minstrels and ballad-mongers; but however high

the genius of H. unquestionably soared above the best of the medieval ballads to which the English ear is accustomed, it is quite certain both that the materials out of which his great poems were composed were nothing but such popular ballads and tales as delighted our forefathers before the invention of printing, and that the spirit and tone of the Homeric epos is distinguished from that of the literary epos or epos of culture precisely by those characteristics which distinguish our old ballads from the poetry of Wordsworth and Tennyson. Of modern poets, the one who possessed the greatest relationship to the genuine old minstrel poets was Sir Walter Scott; but even in his poetry, many peculiarities can be pointed out, which mark the literary writer of a later age, as distinguished from the popular singer of a people's boyhood and lusty youth. In order to understand H., therefore, we must look on him as the culmination of the minstrel or ballad poetry, in the shape of the minstrel epos; a grand combination of popular ballad materials and ballad tone, elevated to the highest pitch of which it is capable, with the architectural form and structure of the epos. To the recognition of this true character of the Homeric poems, the present age has been led mainly by the adventurous and suggestive criticism of the celebrated scholar, Frederick Augustus Wolf. This distinguished German, originally a professor in Halle, afterwards in Berlin, published in the year 1795 the *prolegomena* to a new recension of the text of H., in which he maintained the extreme sceptical view already alluded to, according to which the *Iliad* is no proper epic poem in the sense that the *Æneid* and *Paradise Lost* are so, but only a skilful compilation of popular ballads, originally separate, and of whose separate existence the sharp-eyed critic can now easily adduce satisfactory proof. Now, this theory, commonly called, after its author, the Wolfian theory, and which has found, and still finds, not a few most ingenious supporters in Germany, contains an important element of truth, which has too often been summarily rejected, along with the error which it promulgates. It is not credible that poems pervaded by such a wonderful unity of tone and plan as the *Iliad*, manifestly also inspired by a genius of the highest order, should be resolvable into the mere patchwork of skilful compilers; but it is an important truth to announce that the materials of H.'s poetry were not invented by himself, but taken up from the living traditions of the people to whom he belonged, and that even in the grand unity to which his genius has subjected them, their original popular tone and spirit is preserved in a fashion which characteristically distinguishes them from all epic poetry of the literary ages. There can be no doubt that the merits of Wolf in this regard will soon be as universally recognised in every other country as they have long been in Germany; but, in the meantime, it is to be lamented that of those who have written most largely on the subject, neither Colonel Mure nor Mr Gladstone has been able to exhibit to English readers the true golden mean in this matter between the extravagance of the ultra-Wolfians, and the falsetto of the anti-Wolfian critics and translators. Among the Germans, Welcker, Nitsch, and K. O. Müller, may be named as presenting the best models of judicious and well-balanced criticism in this slippery domain.

The characteristics of H.'s poetry, as the culmination of ballad poetry and the grand model of the minstrel epos, may be expressed in a very few words. In the first place, the materials are essentially national, and if not strictly historical in every detail of decoration, grow, like all ballad poetry,

out of the real life of the people, and rest at least upon an honest historical substratum. In this view, the *Iliad* is as valuable for the earliest history of the Hellenic race, as Herodotus and Thucydides are for the later periods. But it is not for the Greeks alone that H. possesses an important historical value; he is for all ages an important record of the earliest stages of human society, second only to the books of Moses, and perhaps some of the very oldest of the Vedas. The first germs of almost all other arts and sciences afterwards cultivated by the Greeks and Romans are to be found in Homer. In this view, he was to the Greeks themselves an encyclopædia of their national culture; and, as embodying the grand features of their polytheistic faith, he is also constantly quoted by their great writers with all the deference due to a Bible.

The poems of H., as a great human inheritance, have naturally been incorporated, by translation, into all the languages of Europe. In Italian, the translations of Cesarotti and Monti—in French, that of Montbel—in German, that of Voss, are the most famous. In England, we have tried this great problem in the most various styles, and have produced specimens of brilliant success in certain partial aspects. The whole excellences of H. have not yet been exhibited in any one of the notable English translations, nor is such a combination perhaps possible. The grand flow, rapid march, and sonorous fulness of the original, are well given by Pope; the rough dramatic vigour of individual phrases and passages are best rendered by Chapman; while the unaffected truthfulness, and easy, unpretending grace, which so prominently mark the great Smyranean minstrel, appear most clearly in Cowper. Of the recent attempts which have been made, and are making, to present H. in some new aspect to English readers, it is premature to speak. We may only say that the translation of the *Odyssey* in the Spenserian stanza, by Worsley (Blackwood, 1861), is the only one that has received some special marks of public approbation and applause.

Those who wish to enter more minutely into the various questions connected with H. and the Homeric poems, may consult the works on Greek literature by Colonel Mure and K. O. Müller; the special work on H. by Mr Gladstone; the article 'Homer' in Dr Smith's *Dictionary of Ancient Biography*; and the article 'Homer' in the *Encyclopædia Britannica*.

HOMICIDAL MANIA. This is the *monomanie meurtrière* of the French. There is developed, under certain morbid conditions, a blind, irresistible tendency to destroy life. It is independent of hatred, or any appreciable incentive; and even acts in opposition to the general disposition, the interests, and the affections of the perpetrator. Dr Otto of Copenhagen has recorded a series of motiveless murders. Georget gives the case of M. N., who was silent and solitary, but reasonable, and confessed a desire to shed blood, and particularly that of his mother and sister by poniard. He deplored the dreadful tendency, for he loved them both tenderly. Yet the fit returned, and he cried out: 'Mother, save thyself, or I will cut your throat!' The victim selected is most frequently a child, a wife, a benefactor, or an object of love and respect. Hoffbauer, in Germany; Esquirol, Marc, Foville, in France; and Conolly, in Britain, have all demonstrated, and in criminal courts have testified to the existence of this form of mental disease, and ground of irresponsibility; but no recognition has been obtained of the irresistible, motiveless homicidal tendency as a bar to trial or to punishment. The impulse, however, is manifested in a more complicated form. It may originate

in delusions; and the act which first reveals the mental condition may be committed in supposed self-defence, or to secure the salvation, or prevent the suffering of the individual destroyed. Such manifestation may constitute the characteristic symptom of furious madness, where the excited maniac sacrifices all around, or all who resist his course, under the instigation of the predominating passion, or of melancholia and despondency. There occur periods when the tendency to shed blood becomes epidemic or imitative. There is in many natures an ill-defined satisfaction on hearing of slaughter, wars, and atrocities; and such details, or the sight of blood, are said to be suggestive of this tendency. Marc states that six cases of infanticide followed immediately upon the publication of the trial and history of Henriette Cornier, who cut off the head of her child. The puerperal condition, various hereditary tendencies, powerful moral impressions, and atmospherical influences, are conceived to induce this tendency. The proximate cause is generally found to consist in marked organic changes in the nervous system, such as are detectable in epilepsy; or in the more insidious and obscure structural alterations which are supposed to accompany perverted and depraved instincts; although homicidal mania may occur independently of either of these pathological conditions.

Esquirol, *Des Maladies Mentales*, t. ii. p. 115; Marc, *De la Folie*, &c., t. ii. p. 24; Yellowlees, *Homicidal Mania*, *Edinburgh Medical Journal*, August 1862.

HO'MICIDE, a term used in English Law to denote the mere killing of a human being without implying the attendant criminal responsibility. It is used with the word *justifiable*, to denote that the killing was done under lawful authority, as hanging a man or killing a prisoner to prevent him escaping, or killing one to prevent an atrocious crime being committed. *Excusable homicide* means killing in self-defence, or in defence of a wife, child, parent, or servant, or property, or by mere accident. *Felonious homicide* includes murder of one's self or of another; and *manslaughter* is killing without malice, but attended with negligence, hot blood, or in some unlawful way. In Scotland, excusable homicide is generally called culpable homicide.

HO'MILDON, BATTLE OF. In the autumn of 1402, a Scottish army of about ten thousand men invaded England, under the command of Sir Murdoch Stewart of Kincleven, the eldest son of the Regent Albany, and of Archibald Earl of Douglas. They advanced to the gates of Newcastle without opposition, and were returning to Scotland laden with spoil, when they were encountered by an English force under the Earl of Northumberland, his son Hotspur, and the exiled Earl of March or Dunbar. The Scotch took up their position on Homildon Hill, near Wooler. On the 14th September, Hotspur was advancing to charge them, when he was stopped by the Earl of March, until the English archers should do their work. Their shafts were poured with such effect that, in the words of a contemporary chronicler, they bristled in the dense ranks of the Scottish army like quills upon a hedgehog. At length a gallant knight, Sir John Swinton, cried out: 'Brave fellow-countrymen! what has this day bewitched you that you stand here to be shot like deer in a park, instead of proving your courage, as of old, by meeting your foemen hand to hand? Let those who will, rush down with me, in the Lord's name, upon the enemy, and either save our lives, or fall with honour.' At these words, Adam of Gordon, who was at mortal feud with Swinton, sprang forward, and throwing himself on his knees,

besought the honour of knighthood from the warrior, whom he must now look upon as the best knight in Britain. His request was granted; and the two knights, followed by about a hundred retainers, rushed upon the English ranks. They were slain to a man, but not before they had made such slaughter, that the English captains were said to have confessed, that if all the Scots had fought as well, the day would have had a different issue. As it was, the English had an easy victory, and the Scots were utterly routed. Their leaders were taken prisoners; five of their best knights, with many of their bravest esquires, were slain; and besides the numbers that were killed on the field by the English arrows, about five hundred were drowned in attempting to cross the Tweed.

HOMILETICS, that particular branch of sacred rhetoric which regards the composition of the familiar discourses known under the name of homily. The earliest writer on the subject of homiletics is St Augustine, whose book, *De Doctrina Christiana*, is in some sense an adaptation of profane rhetoric to sacred uses. Rabanus Maurus and Isidore of Seville also incidentally treat the subject; but the nearest approach to a systematic treatment of the subject in medieval literature is to be found in Hunibert, *De Eruditione Concionatorum*. St Carlo Borromeo's *Instruktionen Pastorum* was a part of his general scheme for the improvement of clerical education; and in the ecclesiastical course, as well of Catholics as of Protestants, homiletics occupies an important place. The bare enumeration of the works of Schott, Marheineke, Theremin, Sailer, Gisbert, Brand, Laberenz, may shew the importance which is attached in both churches to this branch of sacred science.

HOMILIA'RIMUM, a collection of homilies for the use of pastors. Such collections were in use from a very early period. Mabillon mentions a very ancient Gallican homiliary (*De Lib. Gallican.*). The fifty homilies of Venerable Bede, too, were in familiar use among the clergy in all parts of the West, and we find in the letters of the early medieval time, traces of a busy interchange of sermons, original or otherwise, between bishops and clergy, even in distant countries. The supply, however, was imperfect and scanty, and one of the many reformatory measures of Charlemagne was a compilation of homilies under the title of homiliary, which was made under his direction by the deacon Paul Warnefried. It was compiled in the end of the 8th c., and contains homilies for all the Sundays and festivals of the year. Many synods of that and subsequent periods directed the clergy to translate these sermons for their flocks, and the collection continued in use for this purpose down to the 16th century. It was printed at Speyer in 1482, and again at Cologne in 1557. A collection of homilies is also ascribed to Alcuin, but it seems more likely to have been but a modification of the homiliary of Warnefried. A collection of English homilies turned into verse, that they might be more readily remembered by the people, appears to have been composed about the middle of the 13th century. This collection, affording a metrical sermon for every Sunday and festival-day in the year, exists in MS.; and a portion of it has recently been edited by Mr Small, librarian to the university of Edinburgh.

HOMILIES OF THE CHURCH OF ENGLAND, a collection of sermons, the first part of which was published in 1547, the first year of the reign of Edward VI., to be read in the churches, partly in order to supply the defect of sermons,

but partly, also, to secure uniformity of doctrine, and to guard against the heterodoxies, old and new, which at that time threatened the unconsolidated church. The second part was published in 1562, at the same time with the articles, under Elizabeth. The 35th article declares that 'the Book of Homilies doth contain a godly and wholesome doctrine, and necessary for these times.' The titles are enumerated in the article, and are twenty-one in number. The homilies are not now read in churches; but there is no law to prevent their being so read, and they are frequently appealed to in controversies as to the doctrine of the Anglican Church on the points of which they treat. The precise degree of authority due to them is matter of doubt.

HOMILY (Gr. *homilia*, converse) primitively signifies a discourse held with one or more individuals, but in ecclesiastical use it means a discourse held in the church, and addressed by the minister to the congregation. The practice of explaining in a popular form the lessons of Scripture read in the synagogues, had prevailed among the Jews, and appears to have been adopted in the Christian churches from the earliest times. The discourses employed for this purpose were of the most simple character; but with the exception of one ascribed to Hippolytus (q. v.), we have no sample of this form of composition earlier than the homilies of Origen in the 3d century. Taking these as a type, the early Christian homily may be described as a popular exposition of a portion of Scripture, accompanied by moral reflections and exhortations. It differs from the sermon (Gr. *logos*, Lat. *oratio*) in eschewing all oratorical display, and in following the order of the scriptural text or narrative, instead of being thrown into the form of a rhetorical discourse or a didactic essay. The schools of Alexandria and Antioch appear to have been the great centres of this class of sacred literature, and in the early centuries we find the names of Hippolytus, Metrodorus, Clement of Alexandria, Dionysius, and Gregory Thaumaturgus, as principally distinguished. But it was in the following centuries that the homily received its full development in the hands of the Oriental Fathers, Athanasius, the two Gregories, of Nyssa and of Nazianzum, Basil, the two Cyrils, of Jerusalem and of Alexandria, and above all, Chrysostom; and in the West, of Ambrose, Augustine, Peter Chrysologus, Leo, and Gregory the Great. In later centuries, Venerable Bede, the popes Sabinian, Leo II. and III., Adrian I., and the Spanish bishops, Isidore of Seville, and Ildefonsus, continued to use the homiletic form; and even in the modern church, many preachers have regarded it as the best medium of scriptural instruction; and two different forms of homily are distinguished, the higher and the lower. The former follows the order of matter, rather than of any scriptural passages assumed to be expounded; the latter is a purely exegetical and moral exposition of some lesson from the liturgy, or of some other extract from Holy Scripture.

It is right to add, however, that this strictly historical acceptance of the name homily is by no means uniformly observed in modern use. The name homily is very frequently used, almost as a synonym for sermon, and signifies nothing more than a plain, moral discourse, without ornament or rhetorical pretension, but also without any pretension of being moulded upon the ancient patristical model.

HO'MINE REPLEGIANDO, an old writ in English law, meaning to bail a man out of prison; now disused.

HOMŒOPATHY, from two Greek words signifying 'similar suffering,' is a system of medicine introduced into practice about the close of last century, by a German physician of the name of Hahnemann (q. v.). It is founded upon the belief, that medicines have the power of curing morbid conditions similar to those which they have the power to excite; expressed in Latin by the phrase, *Similia similibus curantur*, and in English by 'Like cures like.' That diseases are cured by substances which produce in persons in health symptoms like those presented by a patient, has been from the earliest times a recognised fact, both by medical writers and by poets who have expressed the prevailing belief of the ages in which they lived. Among the former, we find the author of a treatise generally ascribed to Hippocrates, entitled *On the Places in Man*. This writer gives numerous examples of what may be called *homœopathic* cures; and recommends for the cure of mania this remarkable prescription: 'Give the patient a draught made from the root of mandrake, in a smaller dose than sufficient to induce mania.' The works of the poets abound with illustrations of this belief. Probably the oldest expression of it is in some lines ascribed by Athenæus to Antiphanes, who lived 404 B.C., which have been thus translated—

'Take the hair, it is well written,
Of the dog by which you're bitten;
Work off one wine by his brother,
And one labour with another;
* * * * *
Cook with cook, and strife with strife,
Business with business, and wife with wife.'

Shakspeare, in *Romeo and Juliet*, thus expresses the same maxim—

'Tut, man! one fire burns out another's burning;
One pain is lessened by another's anguish.
* * * * *
Take thou some new infection to the eye,
And the rank poison of the old will die.'

Milton, in the preface to *Samson Agonistes*, gives his version thus: 'In physis, things of melancholic hue and quality are used against melancholy, sour against sour, salt to remove salt humours,' &c. Thus, there has always been a vague tradition that medicines sometimes cured diseases similar to those they caused. But it was reserved for Hahnemann to propound the startling dogma, not only that medicines did occasionally produce such cures, but that true, direct, and radical cures could only be effected by recognising this principle as the guide for the selection of the right remedy in any given morbid condition of the system. The great difficulty of applying this rule to practice arose from the absence of accurate information of the action of medicinal substances upon persons in health, and Hahnemann had to institute a series of experiments upon himself and others, in order to ascertain the effects of the drugs he proposed to employ. He engaged his friends and disciples in this task; they took given quantities of the substance which was the subject of experiment, and each kept a record of the effects it produced. The various records thus obtained were submitted to Hahnemann, who compared them together, and with his own observations on himself, and out of the results thus obtained, compiled what goes by the name of 'a proving' of the medicine. Hahnemann lays it down as one of the fundamental propositions of homœopathy, that no medicine should be given to the sick which has not first been *proved* upon those in health. He devoted himself to this task, and has left ten volumes of such 'proving'; out of this work the various abridgments in popular use in this and

other countries have been derived. The design of *proving* a medicine is to ascertain, with the utmost possible accuracy, all the properties of the substance *proven*. The properties once determined, then it becomes possible to administer it in accordance with the principle of homœopathy. To do so, however, it requires that the medicine should be given by itself. Thus, the second proposition of Hahnemann's system is, 'that only one medicine should ever be given at once.'

To ascertain the effects of medicinal substances upon persons in health—from the knowledge thus obtained to select a remedy whose action corresponds with the symptoms of the patient under treatment—to give this remedy by itself alone, are three of the fundamental rules for the practice of homœopathy. The fourth is, that the dose of a homœopathic medicine should be so small as not to cause any general disturbance of the system, its action being limited to that portion of the body which is in a morbid condition. How small that is, can be ascertained only by experiment. When Hahnemann propounded his system, he pointed out that the amount of the effect of a medicinal substance depends upon two conditions: *first*, the mechanical form in which it is administered; and *second*, the state of the body of the person who takes it.

For example, a hard pill of belladonna of five grains, swallowed by a robust and healthy man, may be followed by only trifling symptoms; but let that pill be dissolved in a pound of water, and an ounce of the solution be given every hour, then we shall have well-marked symptoms of the poisonous action of the drug. But if, instead of administering it to a person in rude health, it be given to one who is suffering from such an inflammation of the tonsils as belladonna produces, then we shall find that the inflamed tonsils will be most acted upon by their specific irritant. Disease implies a preternatural sensitiveness. An inflamed eye cannot bear light, an inflamed stomach cannot bear food, and every diseased organ is powerfully affected by the particular substance which has, in its physiological operation, a close affinity with the character of the morbid condition in which it is at the time its specific medicine is administered.

To arrive at the degree to which it was desirable to reduce the dose, a series of experiments were necessary. It was a matter to which all *a-priori* reasoning was inapplicable. In an article published in *Hufeland's Journal* in the year 1801, Hahnemann observes: 'You ask me what effect $\frac{1}{100000}$ th of a grain of belladonna can have. The word *can* is apt to lead to misconceptions. Let us ask Nature what effect $\frac{1}{100000}$ th of a grain of belladonna *has*.' He then states the conditions of the experiment—viz., that this fraction of a grain should be administered to a patient suffering from a peculiar form of scarlet fever then prevalent in Germany, and presenting a combination of symptoms bearing a close resemblance to those produced by belladonna. Hahnemann maintained that this fraction of a grain was sufficient for the purposes of homœopathic cure. Finding so minute a quantity efficient, he carried the diminution still further, and introduced a wholly novel system of infinitesimal doses.

Homœopathic doses are all expressed by fractions, thus: Suppose the medicine to be a vegetable substance; a strong tincture is made of it, and this is technically called the *mother tincture*. One drop of this mother tincture is added to 99 drops of alcohol, so as to dilute it 100 times, and this preparation is called the *first dilution*, and marked 1. Again, a drop of number 1—that is, of the $\frac{1}{100}$ th of a drop of the mother tincture—is mixed with other 99 drops of alcohol, and marked 2, or the second dilution.

This contains $\frac{1}{1000}$ th of a drop of $\frac{1}{1000}$ th of a drop of the mother tincture, or $\frac{1}{1000000}$ th of a drop of the mother tincture. This simple process of subdivision is continued, and each step is recorded in the same way: thus, number 3 means a millionth; number 6, a billionth; and number 30 (which is the highest recommended by Hahnemann), a decillionth. Insoluble substances, of course, cannot be thus treated; they are triturated with sugar of milk. One grain, say, of sulphur is triturated with 99 grains of sugar of milk, forming the first trituration, and marked number 1; a grain of this first trituration is then triturated with 99 grains of sugar of milk, and this makes the second trituration. The third and subsequent are made in the same way; but after advancing to the fifth or sixth, then it is presumed that all substances become soluble in this very minute proportion in alcohol, and alcoholic dilutions are made of them in the same way as of the vegetable tinctures. After making these alcoholic preparations, the homœopathic chemist saturates with them minute pellicles of sugar of milk, known technically by the name of *globules* or *pilules*.

A system so revolutionary naturally encountered most determined opposition. In Germany, there were legal obstacles to its practice. In Austria, physicians were not allowed to dispense their own medicines, even gratuitously; all medicines administered to the sick were prepared by the apothecaries. Thus, without some change in the law, it was practically impossible to carry out the homœopathic method of practice, for the apothecaries were naturally so opposed to a system which involved the utter annihilation of their profitable occupation, that it would have put their self-devotion to far too severe a test to have committed the fate of homœopathy into their hands. Thus it happened that, from the year 1818 to the year 1836, homœopathy was forbidden to be practised in Austria, and only tolerated under exceptional circumstances, as, for example, in a small hospital attached to an establishment of the Sisters of Mercy, and under powerful patronage. In 1836, cholera broke out for the second time in Vienna, and Dr Fleischmann, the physician to this institution was required by government to prepare the hospital for the reception of cholera patients. He undertook the charge, on the condition that he was to be allowed to employ homœopathy in their treatment. This was granted, homœopathy having been very successful in Vienna and different towns in Germany in cholera in 1830—1831. He treated 732 cases; of these, 488 recovered, and 244 died. The hospital was under daily inspection by the government, and the result of the treatment was made known to Count Kolourat, the home-minister. Shortly after, the emperor issued an ordinance granting to every duly qualified physician the right of practising homœopathy. The cholera mortality under homœopathic treatment was in this instance one in three, while the average mortality of the same epidemic at the same place was two in three.—Wilde's *Austria*.

When cholera was approaching Western Europe, Hahnemann was studying his 'proving,' to ascertain what substance resembled most nearly in its effects the symptoms of the disease. The medicine he found to be camphor; and before he had ever seen a case of cholera, guided by the details given by practitioners, he announced in the year 1831: 'Every one, the instant any of his friends is taken ill of cholera, must immediately give him camphor.' This bold prediction, that camphor was the antidote for the first stage of cholera, was soon tested in Hungary and Moravia, and camphor has since been accepted universally by homœopaths as the most

efficient remedy against an invasion of cholera. During the late Crimean war, it was extensively employed in the French army, by the special desire of the emperor.

The reported success of the homœopathic treatment of cholera at Vienna had a powerful influence in directing public attention to the hospital where the new system was practised. Physicians from all parts of Europe and from America went thither to watch the treatment. In a Report published by Dr Fleischmann some years ago, it is stated that at that time he had treated 17,313 cases, chiefly of acute diseases. Among these were—of erysipelas, 514 cases, of which 510 recovered; of rheumatic fever, 1417, of which 1416 recovered; of intermittent fever, 1066, of which 1058 recovered; of inflammation of the lungs, 1052, of which 1004 recovered.

From Germany as a centre, where it is now extensively practised and taught, homœopathy spread over Europe and America. In America there are upwards of two thousand avowed practitioners of the system. In France, Italy, Spain, and other countries, it has numerous adherents, many of whom occupy influential positions of trust and authority. It was introduced into England in the year 1827 by Dr Quin, physician to the king of the Belgians; and there are now about 300 registered practitioners in Britain who have adopted it. In London, there is a hospital capable of containing upwards of 100 patients, where lectures are regularly delivered by appointed teachers.

The objections entertained by physicians to the so-called 'homœopathic' practice of medicine are based, not upon any unwillingness to employ medicines whose action resembles more or less the features of the disease for which they are prescribed, but solely on the impossibility, according to the common view, of adopting this as a specific rule of practice, and especially as an exclusive and all-embracing law of therapeutics. The action of emetics in some kinds of indigestion, and of rhubarb in some kinds of diarrhoea, are familiar examples in daily use, shewing that ordinary practice is not regulated by any blind prejudice against what is called the homœopathic law of '*similia similibus curantur*;' but in these cases the physician does not in the least commit himself either in favour of or against the law, but rather sets it aside as a mere metaphysical abstraction, having nothing to do with the real principle of the cure, which is to be found in common sense and experience, applied to the facts of individual cases and groups of cases. The true physician is not a sectary; he disowns all artificial formulas of cure, exactly as he disowns homœopathy; and he especially disowns the nickname of *allopathist*, invented for him by Hahnemann. His belief in remedies is not founded on extreme generalisations, and he refuses to be limited in his practice by any other technical rules than those derived from a fair view of facts investigated on the ordinary principles of positive science. It is very certain that Hahnemann's alleged 'proving' have been rejected as in great part visionary by the great majority of those who have attempted to ascertain personally the effect of the same remedies; and it is equally certain that Hahnemann himself admits the general aggravation of diseases by homœopathic doses when administered in sensible quantities, and that the system of infinitesimal doses was with him simply a last refuge from the contradictory character of the results obtained under the earlier trials of remedies devised according to his assumed principle. The argument of physicians in general

has been, that the principle was false, and that the infinitesimal doses are its *reductio ad absurdum*. They admit freely that homeopathy has in some instances done good, by illustrating the spontaneous cure of disease, and correcting a blind faith in heroic remedies; but although individual converts of some local credit have here and there been made, there is not the slightest appearance of a movement in the profession towards adopting homeopathy as a system, and its much-vaunted statistics are generally regarded as extremely fallacious.

HOMOGANGLIA'TA (Gr. *homos*, the same, and *ganglion*, a ganglion), the name given by Owen to the *Articulata* of Cuvier, in accordance with a belief in the great importance of the nervous system as a basis of zoological classification. Each segment in the lowest H. contains a pair of ganglia with nerves proceeding from them; all, however, communicating by nervous filaments, and constituting a continuous chain. In the higher forms, there is a greater concentration, and a more evident allotment of the ganglia of particular segments to particular functions.

HOMOLOGATION, a Scotch law-term, denoting an act or conduct which confirms or approves of something which otherwise might be invalid. Thus, an informal deed, though useless in itself, yet, if acted on by one or both parties, will be set up and made valid, as against the party homologating. To constitute homologation, a clear knowledge of what the party is doing is necessary. The term is not used in English law, but similar effects are produced, and bear other names, such as confirmation, estoppel, part performance.

HOMOLOGOUS quantities or magnitudes in Geometry are such as correspond, or are like to one another. For example, in similar triangles, the homologous sides are those which are opposite to corresponding angles. In the triangles ABC, A'B'C', which are similar, BC is homologous to B'C', AB to A'B', and AC to A'C'. See **HOMOLOGY**.

HOMOLOGY, in Anatomy, is the term now used to indicate structural correspondence, while the term *analogy* is employed to indicate functional resemblance. Thus, by homologue, is implied 'the same organ in different animals, under every variety of form and function;' while by analogue we understand 'a part or organ in one animal which has the same functions as another part or organ in a different animal.' For example, the wings of an insect are the analogues of those of a bat or bird, but not the homologues; whilst the latter are homologues with the arms of man, the fore-legs of quadrupeds, and the pectoral fins of fishes. For further illustration, see Owen *On the Archetype and Homologues of the Skeleton*.

HOMOIOUSIAN (Gr. *homos*, the same, and *ousia*, substance), and **HOMIOIOUSIAN** (Gr. *homoios*, like, and *ousia*, substance), two terms that long distracted the primitive church. The first was the shibboleth of orthodoxy in the Arian controversy, the decree of the council of Nice, which declared the Son to be *homoiousian*, of the same substance with the Father. The rigid Arians, who resisted the decree of Nice, of course rejected the term. The semi-Arians, who held the subordination of the Son to the Father, were divided as to its use. Some of them rejected the word altogether, as directly conveying a false idea; others, while they did not absolutely reject the idea, regarded the word as objectionable, but

rather as susceptible of misinterpretation, than as absolutely false. Both parties argued against its use from a decree of the council held at Antioch in the year 269, against Paul of Samosata, in which the name *homoousian*, as applied to the Son, was expressly condemned. They contended, therefore, that the Fathers of Nice had erred in applying it, and they proposed to substitute for it the term *Homoiousian* (of a like, i. e., a similar but not identical substance with the Father). Without entering into the doctrinal controversy, it will suffice to say, that the term, as used by the council of Antioch, bore a very different signification from that which the Fathers of Nice attached to it. In the controversy with Paul of Samosata, who, with the Sabellians, held that the Father and the Son have but one and the same person, the word *ousia* was employed to signify personality. Hence, when the council condemned the doctrine of Paul, that the Son is *homoousian* with the Father, it merely declared that the Father and the Son are not one and the same person. On the contrary, the council of Nice, in defining that the Father and Son are *homoousian*, understand *ousia* in the very different signification of substance or nature. See the historical treatises of Athanasius, Newman's translation.

HOMOPTERA (Gr. *homos*, the same, uniform, *pteron*, a wing), according to some entomologists, an order of insects; according to others, one of the two great divisions of the order *Hemiptera* (q. v.), differing from the *Heteroptera* in having the first pair of wings of uniform substance throughout (whether perfectly membranous, or somewhat leathery, and so passing into elytra), and the rostrum or sucker originating from the inferior part of the head near the thorax, or even between the first pair of legs. The H. feed on the juices of plants, and some of them are very troublesome to farmers and gardeners. The females of many have an *ovipositor*, by means of which they pierce plants, in order to make a place for the reception of their eggs. The larvæ are active, and resemble the perfect insect, but are wingless. The pupæ are also active, and have rudimentary wings. Among the H. are Cicadas, the largest of the order, Lantern-flies, Froth-hoppers, Aphides, and the Coccus tribe.

HONAN, one of the central provinces of China, having an area of 65,104 square miles, and a population of 23,037,171. Its capital, Kaifung-fu, is situated on the Yellow River, from which it has often suffered, the river-bed being here elevated above the adjacent country. It has been overflowed nineteen times. In the reign of Fuhi (2852 B. C.), it was the capital of China. It has suffered various vicissitudes. In the 12th c. of our era, it was six leagues in circumference. At present, the city is uninteresting to Europeans, save as the residence of the Jews of China, now dwindled to a few families.

HONAWAR, a seaport on the Malabar or west coast of the peninsula of Hindustan, belongs to the presidency of Madras, which here extends from shore to shore. It is in lat. 14° 17' N., and long. 74° 30' E., being 340 miles to the south-east of Bombay. It stands on the north side of an inlet of the Arabian Sea, which receives the Gerseppa or Sheravatti from the Western Ghats. Though both the harbour and the anchorage outside have a good bottom and a sufficient depth, yet, in the season of the south-west monsoon, the surf is a serious impediment to navigation.

HONDURAS, the middle state of Central America, extending east and west from the Caribbean Sea to the Pacific Ocean, and separating Nicaragua on the south-east from Guatemala on the

north-west. It stretches in N. lat. between 13° 10' and 16°, and in W. long. between 83° and 89° 45', containing about 42,000 square miles, including a portion of the Mosquito Territory, and 358,000 inhabitants, most of them, wholly or partly, of aboriginal blood. The country is generally mountainous, being traversed by the Cordilleras (q. v.), which connect the Andes on the south with the Sierra Madre on the north. The principal rivers are the Chamelicon, Ulna, Aguan, and Choluteca. An excellent agricultural country, H. abounds also in mineral wealth. The minerals are gold, silver, copper, iron, cinnabar, zinc, antimony, tin, platinum, opal, amethysts, asbestos, chalk, limestone, marble, and coal. The soil produces valuable timber, fruit-trees, cotton, sugar, coffee, tobacco, indigo, maize, wheat, potatoes, yams, plantains, bananas, and beans. The foreign trade is carried on chiefly with Great Britain, the United States, and Spain. The imports, amounting in 1855 to 675,000 dollars, or £135,000 sterling, consisted to the extent of more than one-half of cotton manufactures—the articles next in order, woollens, silks, and wines and spirits, having been almost precisely one-fifth part of the sum-total. To distinguish the northern and southern branches of the external commerce—and that with reference to the year already mentioned—the official returns stood thus :

	Imports. Dollars.	Exports. Dollars.
By the Atlantic,	600,000	460,000
By the Pacific,	75,000	75,000

The single outlet on the latter side is Amapola ; while on the former are Omoa, Truxillo, and Puerto Cabellos.

HONDURAS, BAY OF, an inlet of the Caribbean Sea, extends between Yucatan and Guatemala on the west, and Honduras on the south. From the adjacent countries of British Honduras and Yucatan it receives a variety of streams, the chief of which is the Balize, and contains several islands. The shore is marked by reefs.

HONDURAS, BRITISH. See **BALIZE**.

HONES, or **WHET-STONES**, a particular class of stones used for the purpose of sharpening edge-tools, such as knives, scythes, &c. They are usually cut into pieces about a foot in length, and from an inch to two inches thick, and either left square or rounded, according to their intended uses. The finest kind of hones are those called oil-stones ; these are hard, compact, and so very silicious, that they readily wear down the hardest steel ; they are varieties of slate, derived from the argillaceous schists of the Palaeozoic period. The best are those brought from Turkey ; Bohemia is also celebrated for its hones ; and excellent ones are found in Persia, in the Harz Mountains, in Styria, in America, Spain, Peru, and in Siberia. In Great Britain, several localities yield hone-stones of excellent quality, and none better than the celebrated Water-of-Ayr stone, which is much used for polishing copper-plates, as well as for hones. The Welsh oil-stone or Idwall stone, and the cutler's green-stone, are obtained from Snowdon in Wales ; and in the neighbourhood of Tavistock, the Devonshire oil-stones are procured. Whatever part of the world they come from, they resemble each other very closely. The hones used for sharpening scythes and other large blades are usually made of some coarse-grained sandstone ; these are manufactured in many localities.

HO'NESDALE, a new and flourishing village in the north-east part of Pennsylvania, United States, America, 160 miles north-east from Harrisburg. It is situated at the confluence of the Lackawaxen and Dyberry Creeks, and connected by canal and

railway with New York. It is the centre of an important coal-district, from which anthracite coal is sent to the Atlantic cities. In 1859, it contained nine churches, an academy, bank, foundry, tanneries, glass-works, mills, and three newspapers. Pop. about 5000, and rapidly increasing.

HONESTY (*Lunaria*), a genus of plants of the natural order *Cruciferae*, of which two species, natives of the south of Europe, *L. annua* or *biennis*, and *L. rediviva*, have long been cultivated in British flower-gardens, partly on account of the beauty of their flowers, and partly of the curious appearance of their large flat seed-pouches (*silicules*). They are 1—2½ feet high, with rather coarse foliage. The origin of the English name is doubtful. Some of the older English poets mention the plant as *Lunarie*. It was regarded, in the days of superstition, as possessing extraordinary virtues.

HONEY is secreted by the nectariferous glands of flowers, from whence it is collected by the working or neuter bees, which extract it by means of the proboscis, and pass it into the dilatation of the oesophagus, known as the crop or honey-bag. When the animal has arrived at the hive, it disgorges the honey, probably altered by admixture with the secretion of the crop, into the cells of the comb. It is used by the bees as food, but it is its general properties and its uses to man that here require notice.

The composition of honey varies somewhat according to the food of the bees, their age, the season, &c. Hybla, a mountain in Sicily, and Hymettus, a mountain in Attica, were in ancient times celebrated for their honey ; doubtless in consequence of the wild thyme and other fragrant herbs growing on them. The honey of Narbonne and Chamouni is now held in high estimation for similar reasons ; and in this country, honey obtained by bees having access to heather has, as is well known, a peculiarly agreeable taste. The substances which have been recognised in honey are sugar of two kinds—one crystallisable and analogous to Glucose (q. v.), and the other uncrystallisable, mannite (according to Guibourt) ; gummy, waxy, colouring and odorous matters ; and pollen. The proportion of crystallisable sugar increases with the age of the honey, so as to give it in time a granular character. The best and newest honey is a clear fluid contained in a white comb, while older honey is of a yellowish, and even reddish tint.

From the remotest times, honey has been employed as an article of food ; and to the ancients, who were unacquainted with sugar, it was of more importance than it now is. 'A land flowing with milk and honey' offered the highest conceivable advantages to the eastern mind. Taken in moderate quantity, honey is nutritive and laxative, but dyspeptic persons often find that it aggravates their symptoms. Its therapeutic action is probably not very great, but it is employed with advantage to flavour and give a demulcent character to various drinks or mixtures prescribed for allaying cough ; and in the form of *oxymel*, which is usually prepared by mixing honey, acetic acid, and water, it is frequently added to gargles, or mixed with barley-water, so as to form an agreeable cooling drink in febrile and inflammatory affections, or given as an expectorant in coughs and colds.

It should be mentioned that honey occasionally possesses very deleterious properties. Xenophon, in his history of the Retreat of the Ten Thousand (*Anabasis*, book iv.), describes the honey of Trebizond as having produced the effect of temporary madness, or rather drunkenness on the whole army who ate of it. Mr Abbot, writing from Trebizond in 1833

to the secretary of the Zoological Society, observes that he has himself witnessed that the effects of this honey are still precisely the same as those which Xenophon describes, and he adopts the views propounded by Tournefort in 1704, that the poisonous properties are consequent on the bees extracting the honey from the *Azalea Pontica*. Many other instances of poisonous honey are on record.

Honey, although not of so much importance commercially as it was before sugar became so large an importation, is nevertheless brought to this country from abroad in considerable quantities, which, in addition to the home produce, mentioned in the article BEE, shews that it is still largely in demand. Nearly fifty tons are annually imported from various parts of the world: North America, the West Indies, Portugal, France, and Greece, are the countries from which we receive most. The French is very fine, and is chiefly consumed for domestic and medicinal purposes; the Greek is the finest, and is only used as a table delicacy; most of the other kinds are inferior, and excepting some portion which is used by the tobacco manufacturers, to give a spurious sweetness to tobacco, it is difficult to account for the consumption of so large a quantity. Honey is often very much adulterated. One of the most common materials used for that purpose is flour; samples of French honey have also been found largely adulterated with gelatine; the latter cannot so easily be detected, as there is always present naturally a portion of gelatine in honey. The quality of even the best depends upon its careful refinement or clarifying. If honey be slightly heated, the chief impurities rise to the surface, and can easily be removed by skimming; this is usually done, except in the case of virgin honey, which is generally sufficiently pure for most purposes.

HONEY BUZZARD, or **PERN** (*Pernis*), a genus of *Falconidæ*, allied to kites and buzzards, but differing from them, and from all other *Falconidæ*,

Honey Buzzard (*Pernis apivorus*).

in having the *lore*, or space between the eye and the bill, closely covered with feathers, which overlap one another like scales. The food of honey buzzards consists, not of honey, but chiefly of bees, wasps, and their young, in quest of which these birds dig up the ground, to get at the nests of the insects. They feed also partly on other insects, and less frequently on lizards, small birds, &c. One species (*P. apivorus*) is found in Britain, but is rare; it is rather larger than a common buzzard.

HONEYCOMB MOTH, or **WAX MOTH** (*Galleria*), a genus of small moths of the same tribe with clothes' moths, of which some of the species are remarkable for infesting bee-hives. There they

deposit their eggs; and the larvæ feed on the honey-comb, through which they make tunnels lined with silk, and in the midst of which they finally spin their cocoons and undergo their transformations. The cocoons are often united in little heaps. These moths, when numerous, are very injurious, and sometimes quite destructive to the bees, from the stings of which they seem to enjoy a perfect immunity.

Honeycomb Moth:

a, *Galleria mellonella*; b, larva; c, pupa; d, larva working its way through honeycomb; e, *Galleria alvearia*.

G. mellonella or *cereana*, perhaps the most destructive species, is about an inch in extent of wings; *G. alvearia* not much more than half an inch. Both have a satiny appearance, and are amongst the worst enemies the bee-keeper has to encounter.

HONEYCOMBS, in guns, are flaws resembling the cells made by bees, worked in the metal by the action of exploded gunpowder. They spread rapidly, and, with continuous firing, soon eat into the metal to such an extent as to render the further use of the gun dangerous.

HONEY-DEW, a viscid saccharine exudation which is often found in warm dry weather on the leaves and stems of plants, occurring both on trees and herbaceous plants. It is usually, but not always associated with the presence of *Aphides*, *Cocci*, and other insects which feed on the juices of plants, and its flow is ascribed to their punctures; but the rupture of the tissues from any other cause, such as the state of the weather, seems also to produce it, and warm dry weather seems to be necessary for the production in the sap of that superabundance of sugar which is thus thrown off. *Aphides* themselves exude by certain peculiar organs (see *APHIS*) drops of a fluid which is called honey-dew, which probably differs considerably from the direct exudation of the plants on which they feed, but mingles with it where they abound. Honey-dew is often so abundant as to fall in drops from one leaf to another on to the ground, sometimes falling from trees even as a copious shower. Different kinds of manna are the dried honey-dew or saccharine exudation of certain plants. See *MANNA*. But very generally, this exudation, as it dries, coats the surface of leaves and branches with a clammy film, to which everything brought by the atmosphere adheres, and on which moulds and other small fungi soon grow, and thus the pores of the plant are clogged and its health is impaired. Gardeners are therefore careful to wash off honey-dew with the syringe. Orange and lemon plantations sometimes suffer great injury from the abundance of honey-dew; and it has proved a cause of very great loss in the coffee-plantations of Ceylon.

HONEY-EATER, or **HONEY-SUCKER**, a name sometimes given to some of the Sun-birds (q. v.), but also the common name of a large family of birds nearly allied to these and to humming-birds, and peculiar to Australia and the islands of

New Holland Honey Eater (*Meliphaga Nova Hollandia*).

that part of the world. This family, *Meliphagidae*—of the order *Insectores*, and tribe *Tenuirostres*—has a long curved sharp bill, not so slender as in humming-birds and sun-birds; the tongue terminates in a pencil of delicate filaments, the better to adapt it for sucking honey from flowers, or juices from fruits. These are a principal part of the food of the honey-eaters, but they also devour insects in great numbers. They are birds of elegant form, and generally of gay plumage. Most of them have a long and broad tail. They may be observed fluttering and darting among trees and shrubs when in blossom, and are very abundant in all parts of Australia. They are extremely vivacious and active, and keep up a continual chattering. One of the most splendid species, *Meliphaga* or *Ptiloris paradisus*, is called the Rifleman or Rifle Bird by the Australian colonists. Another species, *Myzantha melanophrys*, is called the Bell Bird, because its voice much resembles the tinkling of a little bell. To this family is referred the Poe Bird, Parson Bird, or Tui-tui (*Prosthemodera Nova-Zeelandiae*) of New Zealand, a bird larger than a blackbird, and of a deep metallic green colour, becoming bronze and black in certain lights, with snow-white tufts of downy curling feathers on the sides of the neck. Unlike most of the *Meliphagidae*, it is a bird of fine song. It has also great powers as a mocking-bird, readily learns to speak many words, and becomes very familiar in domestication.

HONEY-GUIDE, INDICATOR, or **MOROC** (*Indicator*), a genus of birds ranked in the Cuckoo family, but differing from the true cuckoos in characters which shew an approach to woodpeckers, and also, in some respects, to creepers. They are all natives of Africa, and are found in almost all parts of it. They have acquired their name from guiding men to honey; a curious instinct prompting them to flutter near the traveller with frequent repetitions of a cry which resembles the syllable *cherr*; and it is said, that if followed, they almost always lead to a place where a bees' nest may be found.

HONEY LOCUST TREE (*Gleditsia triacanthos*)—also known as the **SWEET LOCUST** and **BLACK**

LOCUST, and in Britain as the **THREE-THORNED ACACIA**—a lofty and beautiful tree of the natural order *Leguminosae*, sub-order *Casalpiniæ*, a native of the valleys of the Alleghanies, and of the basin of the Mississippi. It is not found wild on the Atlantic coast of North America, although often planted for ornament in the vicinity of habitations. The flowers—which are small, greenish, and in spikes—have, when perfect, six stamens and one pistil, but are very generally unisexual. The leaves are twice pinnate, without terminal leaflets, the numerous small leaflets giving a peculiar gracefulness to the foliage, which is of a light shining green. The tree is furnished with numerous sharp triple spines. The pods are long, flat, pendulous, often twisted; the seeds large, brown, and enveloped in a pulp, which, when the pod is ripe, is very sweet. Sugar has been made from it, and when fermented, it yields an intoxicating beverage, in use among the American Indians. The honey locust attains a height of 70 or 80 feet. Trees of large size are to be seen in some parts of Britain. The wood resembles that of the American Locust Tree (q. v.), or False Acacia (*Robinia pseudacacia*), but is more coarse-grained.

HONEY-STONE, or **MELLITE**, a mineral of remarkable characters and composition, found in connection with coal and sulphur in several places in Germany. It occurs in square octahedrons, looks like a honey-yellow resin, and may be cut with a knife. It is a mellate of alumina, consisting of mellic acid, alumina, and water.

HONEY-SUCKLE (*Lonicera*, or, according to some botanists, *Caprifolium*, which others make a sub-genus of *L.*), a genus of plants of the natural order *Caprifoliaceæ*. They are shrubs, often twining, and have the flowers either in whorls or in pairs. The calyx is short and 5-toothed; the corolla tubular-funnel-shaped, 5-cleft, generally two-lipped; the fruit a 3-celled and many-seeded berry.—The **COMMON H.**, or **WOODBINE** (*L. periclymenum*), is very abundant in woods and thickets in most parts of Britain. On account of its beautiful cream-coloured whorls of flowers and their delicious fragrance, it is often planted in shrubberies, and trained against walls. It is said to be the 'twisted eglantine' of Milton. The phenomena observed in its growth have been adduced in proof of a *perceptive power* in plants: the branches shooting out till they become unable to bear their own weight; and then, on their meeting with any other branch, twining around it, from right to left; but if they meet only with one another, twining in different directions, one to the right, and another to the left.—Very similar to this is the **PERFOLIATE H.** (*L. caprifolium*), with paler whorls of flowers, and remarkable for having the upper leaves united so that an opposite pair form one leaf, through the middle of which the stem passes. This peculiarity is confined to the flower-bearing shoots, and does not occur on the young runners; it is also most perfect nearest the flower. This species is a native of the south of Europe, but now naturalised in many parts of Britain, and much planted, as although less powerfully fragrant than the Common H., it flowers earlier.—There are numerous other species, natives of Europe, Siberia, and North America.—The **FLY H.** (*L. xylosteum*) is an erect shrub, a native of Europe and Asia, scarcely indigenous in Britain, but common in shrubberies. Its branches are not unfrequently used in some parts of Europe for tubes of tobacco-pipes; and it is said to make good hedges in dry soils. Other erect species are not unfrequently planted in shrubberies.—The **TRUMPET H.** (*L. sempervirens*), called in America the **CORAL H.**,

is a native of the southern states of North America, often planted in Britain on account of its beautiful flowers, red on the outside, and scarlet within, which, however, have no fragrance. It is a twining evergreen shrub.—The berries of the honeysuckles are nauseous.—The name *H.* is also given to shrubs very different from this genus, but of which the flowers abound in honey, as to species of *Banksia* in Australia. *Azalea viscosa* is called Swamp *H.* in North America.

HONEYSUCKLE, FRENCH. See **FRENCH HONEYSUCKLE.**

HONEYSUCKLE ORNAMENT, a form characteristic of eastern art. It is used in Assyrian, Persian, and Hindu architecture, and wherever used indicates an eastern origin. The Greeks borrowed it from the Persians, and, by refining and improving it, made it one of the most beautiful ornaments of their architecture. It is chiefly used in the Ionic Style (q. v.). See also **GRECIAN ARCHITECTURE.**

HONFLEUR, a small town and seaport of France, in the department of Calvados, is situated on the southern shore of the estuary of the Seine, opposite to, and seven miles distant from the port of Havre. Its situation, backed by wooded heights, is exceedingly pleasing; but it is badly built, dirty, and uninteresting. The commerce of *H.*, once of some importance, has been absorbed in great measure by Havre; many vessels, however, engaged in the fisheries, are still owned here, and there is a considerable trade in the export of eggs and fruit to England, and in timber. The principal manufactures are hosiery, chemical products, hardware, and refined sugar. There are also rope-walks and ship-building yards. The harbour is furnished with two light-houses. Pop. 8739.

HONG-KONG ('Fragrant Streams,' but better known now among the Chinese as Kwan Tai Lu, or 'Petticoat String Road'), a British island off the south-east coast of China, is situated in the estuary of the Chu-Kiang, about 100 miles south-east of Canton. It is nine miles long, from two to six broad, and has an area of about 29 square miles. The capital, Victoria, is situated in lat. 22° 16½' N., long. 114° 8½' E. Pop. (1861) 119,000, 84,000 of whom were Chinese. The total public income in 1861 was £127,241; the expenditure, £109,632, of which £41,217 was laid out on public works.

The island is covered to the shore with mountains, many of the peaks ranging from 1000 to nearly 2000 feet high. The mountains consist chiefly of granite, serpentine, and trap; granite quarries are skilfully worked by the Chinese. The climate is still very unhealthy for Europeans, though not so bad as it was in the earlier years of the colony, when the ground was first opened for purposes of building. For about six months, from May to October, the heat is oppressive in the extreme, being accompanied with much rain and damp, and the city of Victoria is so situated as to be shut out from the refreshing influence of the south-west monsoon. During four of the winter months, the weather is cool, dry, bracing, sometimes even cold; but the change from the perspiration of summer to a dry cold is apt to produce dangerous diseases, more especially of the kidneys. The temperature in summer ranges from 83° to 96°, and in winter from 40° to 75°. On the mainland, opposite the northern shore of the island, and separated from it by a narrow channel varying from half a mile to four miles in width, is the Kow-lung Peninsula, a strip of coast territory and portion of the township of the same name, which was ceded to the British government by the convention of Peking, October 24, 1861.

Victoria, the chief town, is situated on the northern shore of the island, on a small bay surrounded by mountains. It is laid out in magnificent streets, has increased with astonishing rapidity, and is one of the most beautiful British possessions in Asia. Its harbour is commodious and safe; its roadstead has a depth of from three to seven fathoms, and affords good anchorage. Provision-stores and repairing-docks for the ships of the naval station of the sea of China have been established here; merchant-vessels are also repaired here. Between Victoria and Canton, Macao, Shanghai, Singapore, Bombay, Calcutta, &c., frequent and regular communication by steam is maintained. The magnificent harbour of *H.* presents a most stirring appearance. Steamers and sailing-vessels are arriving and departing daily. In 1860, 2888 vessels, of 1,555,645 tons, entered and cleared the port. Here all the great English houses centralise their operations and conduct their money transactions; yet *H.* occupies only a secondary rank in the commerce of China. Part of the merchandise from Europe goes direct to the place of its destination, without touching at this British settlement; in the same manner, hardly any of the teas and not much of the silks exported ever come to Hong-kong. The trade of *H.* is chiefly in opium, in supplying war and other vessels with stores, in repairing vessels, and in the transfer of passengers. In 1857—1858, the value of the manufactures and produce imported into India from this island was £659,474. Already one of the most flourishing of British colonies, *H.* is probably destined to further extension and importance, and will rise with the gradual increase of the commerce of Eastern Asia.

In 1843 this island was ceded in perpetuity to her Britannic Majesty by the treaty of Nankin, having been occupied as a preliminary measure in 1841. Its affairs are ruled by a governor (at present, 1862, Sir Hercules Robinson) and legislative council, who have their seat of administration here.

HONITON, a small market-town, and municipal and parliamentary borough of England, in the county of Devon, is beautifully situated in a graceful and highly cultivated valley, near the left bank of the Otter, 16 miles north-east of Exeter. The Old Church contains a light and elegant oak-screen, erected in 1482 by Courtenay, Bishop of Exeter. *H.* has long been famous for the lace, called from the town in which it is the chief branch of manufacture, 'Honiton Lace.' This lace is made by hand on a pillow; its manufacture was introduced into England by the Lollards during the reign of Elizabeth. The vale of Honiton is famous for its butter. Pop. of parliamentary and municipal borough in 1861, 3301. The borough returns two members to the House of Commons. (1871—pop. 3470.)

HONOLULU, a seaport in lat. 21° 18' N., and long. 157° 55' W., on the south-western or leeward coast of Oahu, one of the Sandwich Islands (q. v.), is perhaps the only spot in Polynesia that can fairly claim to be reckoned as an integral part of the world of commerce and civilisation. Being the seat of government, as well as the centre of trade, it is, in every sense, the metropolis of its own group, which is at once the largest and the most important of all the kindred clusters. But beyond this, its intrinsic advantages, and the absence, or at least the distance, of rivals along the surrounding waters, in any direction, have combined to render it an entrepôt between the opposite shores of the Pacific. Besides attracting numbers of whalers for repairs and supplies, *H.* occupies a most convenient position on each of the three great thoroughfares of its own giant ocean.

Though Oahu, in common with the rest of the chain, is evidently of volcanic formation, yet the reef, which forms the breakwater of the harbour of H., is of coral formation. The temperature of the town ranges between 67°·9 in January, and 83°·2 in August; so that, roughly computed, the annual mean is 75°·55, with a divergence in either direction of only 7°·65. The tropical heat is modified by periodical north-easters. The population, consisting chiefly of natives, numbers fully 10,000. This mart of traffic has, for sixty years, maintained the unity, and, through the unity, the peace of the once independent and hostile tribes of the Hawaiian Archipelago. In 1857 the departures were represented by 69 vessels, and 23,183 tons; and the arrivals by 75 vessels, and 24,200 tons. In the same year, the exports amounted to 472,997 dollars, the imports to 1,401,976, and the customs to 155,640 dollars. In H. are to be found consuls from the United States, the Hanse Towns, Chili, Denmark, Spain, France, England, Hanover, Oldenburg, Peru, Prussia, Russia, and Sweden.

HONORARIUM, a term sometimes used to denote the fees payable to counsel or physicians, because they were presumed to be given as a present, and paid beforehand, and not on the vulgar theory of payment for services rendered. The legal effect which followed was, that neither counsel nor physicians, if not paid their fees beforehand, could bring an action against the client to recover them. This is still the case in the United Kingdom as to counsel, but not as to registered physicians, who can now recover their fees by action. The law as to how far a counsel can validly make a special agreement for a fixed sum, and sue for it, has been fully discussed in England in the late case of *Kennedy v. Brown*, but has not yet been decided.

HONORIUS, FLAVIUS, second son of Theodosius the Great, was born, according to the best authorities, 9th September 384 A.D. On the death of his father, the empire was divided into two parts, H. receiving the western half, with Rome as his capital; but being only ten years old, was put under the guardianship of Stilicho (q. v.), who was all his life the *de facto* ruler of the Western Empire. H. first took up his residence at Milan, where, in 398 A.D., he married Maria, the daughter of Stilicho. The most important events of H.'s reign were the various treaties concluded with the German tribes who dwelt on the Rhine and Upper Danube; the rigorous persecution of paganism in 399; and the devastation of Northern Italy by Alaric and his Visigoths in 400—403. Stilicho was then in Germany; but on his return, he speedily cleared the country of the invaders, after totally defeating them at Pollentia (March 403). Another irruption of barbarians, under Rhadagaisus, took place in 405—406, which was again repelled by the powerful arm of Stilicho. Nevertheless, this brave soldier and able minister lost the favour of his weak and worthless master, and was treacherously slain at Ravenna, 408 A.D. Alaric was not slow to take advantage of the opportunity afforded him. In 408 A.D., he invaded Italy, and besieged Rome, which only escaped on payment of a heavy ransom; and in the following year he again besieged and took it, raising Attalus to the imperial purple. The death of the invader in 410 A.D., after having a third time besieged Rome, again freed Italy. A new champion of the falling empire arose in the person of Constantius, who suppressed the rebellions of Constantine, Jovinus, and Sallustius in the northern provinces, and of Heraclian in Africa. He was now appointed the colleague of H. in the consulship, and received in marriage the hand of

Placidia, sister to H., along with a share in the empire, which he did not long enjoy, as his death took place a few months after. The Gothic and German tribes had for some time been slowly but steadily encroaching upon the Western Empire, and H.'s reign saw Spain, Gaul, and Pannonia, some of the finest provinces, snatched from its grasp. He died 27th August 423. H.'s character presents few salient points. He was weak and foolish, and when excited by fear or jealousy, cruel and treacherous, a trait well brought out in his treatment of Stilicho and Constantine.

HONORIUS, the name of four popes.—**HONORIUS I.** has been the subject of much controversy, not alone between Catholics and Protestants, but also between the Gallican and Ultramontane schools of Catholics themselves. He was born of a consular family in Campania. Of his early history, little is known, except that he took an active part in bringing to a close the disputes which arose in Northern Italy about the controversy of the Three Chapters (q. v.). On the death of Boniface V., in 625, he was elected Bishop of Rome. His general administration of church affairs has been favourably judged by historians; and his name is especially connected with the history of the paschal controversy in Ireland, and with that of the early Anglo-Saxon Church. But his pontificate is particularly memorable on account of the Monothelistic heresy. See **MONOTHELISM**. H. is connected therewith rather negatively, than by any positive participation, in the dissemination of the Monothelite doctrine. While the controversy was yet new in the West, Sergius, Patriarch of Constantinople, wrote to H., to explain the Monothelistic doctrines in the most favourable light, and to suggest that it would be most desirable to impose silence on both parties, in a dispute which really did not affect the substance of the Catholic doctrine. H., misled it is alleged by this statement of Sergius, consented, and even expressed himself in language which would appear to condemn the doctrine of two wills in Christ. The Catholic historians, however, maintain that in thus disclaiming the belief of two wills in Christ, H. merely denied the existence in Christ of two discordant or conflicting wills, that is, of a *corrupt and sinful human* will opposed to the divine will. It is not easy, perhaps, to reconcile this with the decree of the sixth general council, in which H. is anathematized in company with many others, of whose heterodoxy there can be no doubt. But the defenders of H. reply, that although the sixth council certainly does include H. in one common condemnation with a group of heretical teachers, yet the explanation appended to the condemnation of the former, viz., that 'he had not by the exercise of his apostolic authority extinguished the rising flame of heresy, but by neglecting it, favoured its progress,' clearly alludes to the error of judgment described above, by which, although himself personally orthodox, he enjoined silence on the controversy at a time when a more far-sighted ruler would have felt it his duty to interfere by a clear and explicit declaration. On the whole, they maintain that, however H. may by his imprudent silence have compromised the interests of orthodoxy, he did not put forth any such dogmatic declaration as can fairly be regarded, whether by Protestants or by Gallicans, as irreconcilable with the strict ultramontane doctrine of infallibility, inasmuch as that doctrine contemplates the pope as 'speaking from the apostolic chair.' H. died in 638. Some letters of his are preserved in Labbe's *Coll. Conciliorum*, vol. iii.

HONOUR, ACCEPTANCE FOR, a phrase used in

the law of bills of exchange, to denote that a stranger volunteers to accept a bill out of respect to a foreign party issuing the bill to persons in this country, who refuse to accept, in which case the stranger accepting, incurs certain responsibilities.

HONOURABLE, RIGHT HONOURABLE, AND MOST HONOURABLE; titles given in the United Kingdom to Peers, their families, and persons holding certain public situations. A Marquis or Marchioness is styled Most Honourable, a Peer (temporal) or Peeress of a lower grade, whether by right or by courtesy, is Right Honourable. The title Right Honourable is also bestowed on the younger sons of Dukes and Marquises, and their wives; and on all the daughters of Dukes, Marquises, and Earls; and Honourable on the younger sons of Earls, and all the children of Viscounts and Barons. Privy Counsellors, the Lords Mayor of London, York, and Dublin, the Lord Advocate of Scotland, and the Lord Provost of Edinburgh, are also entitled to the prefix Right Honourable; and Maids of Honour, Lords of Session, the Supreme Judges of England and Ireland, to that of Honourable. Members of the House of Commons, though Honourable is not prefixed to their names, are distinguished as the 'Honourable member for —'; and the East India Company has been held entitled to the same prefix. In America, the characteristic love of title has been shewn in the practice of attaching Honourable to the names of governors of states, judges, members of congress, and other public functionaries.

HONOURABLE ORDINARIES, in Heraldry. See ORDINARIES.

HONOURS, MILITARY AND NAVAL. See SALUTES.

HONOURS OF WAR, the term used to express the privileges allowed to a garrison surrendering, either in consideration of a brave defence, or from some other cause. Many degrees of honour may be paid to a vanquished enemy, according to the generosity or judgment of the victorious commander-in-chief. In some cases, the garrison is allowed to march out with all its arms, drums beating, colours flying, &c.; at another time, the conquered force will only be permitted to advance silently to the front of their works, there to ground or pile arms, and then, facing about, to return to their lines as prisoners of war. Occasionally, the capitulation will provide that the garrison shall deposit their arms and warlike stores at some specified spot, and then march on to their own territory on parole of not serving during the existing war against the victors or their allies.

HONTHEIM, JOHN NICHOLAS VON, was born at Treves in 1701. He was educated in the Jesuit school of his native city, studied canon law at Louvain under the celebrated Van Espen, and afterwards taught it for ten years at Treves, of which see he became coadjutor in 1748, with the title of bishop *in partibus infidelium*. He is the author of two voluminous works on the history of Treves, *Historia Trevirensis Diplomatica* (3 vols. fol., 1750), and *Prodromus Hist. Trevirensis* (2 vols. fol., 1757). But his literary career is chiefly memorable for a theological essay, which, although with very mean pretensions to learning, by the novelty and boldness of its views, created an immense sensation in the theological world. The title of this work, which was in Latin, and dedicated to Pope Clement XIII., is 'On the State of the Church and on the Legitimate Authority of the Roman Pontiff,' a work composed with a view to the reunion of Christian sects. The name of

the author was for a long time unknown, the work being published under the *nom de plume* of Justinus Febronius (a name said to be taken from that of H.'s niece, who was called Justina Febronia), whence the system of church government which the work propounds has been called Febronianism (q. v.). His scheme may be described as a very exaggerated form of Gallicanism, with the democratic element of congregationalism superadded. The work immediately after its appearance was condemned by Clement XIII., as well as by many individual bishops. It drew forth a number of replies, the most important of which are those of Zaccaria (1767) and Ballerini (1768). Pius VI., in 1778, required from H. a retraction of these doctrines. This retraction, however, was modified by a subsequent *Commentary*, published at Frankfurt in 1781, to which, at the desire of the pope, Cardinal Gerdil replied. H. eventually made full submission to the church. He died in his 90th year, at Montquinten in Luxemburg, September 2, 1790.—See Menzel's *Neuere Geschichte der Deutschen*, xi. 456, and foll.

HONVÉD (Land-defenders), the name given in Hungary under the earlier kings to the national champions. With the disappearance of these, the word too disappeared; but in the summer of 1848 it was revived, and applied first to those Hungarian volunteers despatched to the south against the Servians, and subsequently, when the war with Austria really commenced, to the whole patriotic army. Still, in common parlance, the term Honvéd is used only with reference to the Hungarian infantry.

HOO'BLY, a town of Dharwar (q. v.), in the presidency of Bombay, stands in lat. 15° 20' N., and long. 75° 13' E. It contains 15,000 inhabitants, and is one of the principal cotton-marts in that section of India. A good road has been constructed to the Malabar coast, by which the raw cotton of the neighbourhood is easily and cheaply transported for shipment.

HOOD, ROBIN, the hero of several old ballads and traditional stories, which generally represent him as an outlaw and a robber, but of a gallant and generous nature, haunting the depths of Sherwood Forest, Nottinghamshire, and of Barnsdale Forest, Yorkshire, in an early era of English history, which it has hitherto been customary to fix in the 12th century. The earliest authentic notice of him is in the *Vision of Piers Ploughman*, a poem dating from between 1355 and 1365: 'rhymes of Robin Hood and Randolph Earl of Chester' are there alluded to. About 1495, Wynkyn de Worde printed a poem of considerable length, entitled *The Lytel Geste of Robyn Hood*—apparently a series of rude popular ballads strung together, being probably a modification of the 'rhymes' spoken of in Piers Ploughman. Thus we see evidence for a considerable antiquity to the ballads commemorating Robin H., a collection of which filled two little volumes printed by Ritson in 1795. It is also certain that, in the early part of the 16th c., there was a widespread celebration of annual rustic sports and masqueradings, under the name of the *Robin Hood Games*, in which the deeds of the hero, and of his companions, Little John, Friar Tuck, &c., and of his sylvan mistress, Maid Marian, were represented. These even extended to Scotland, where the Reformers had some difficulty in putting them down. In the ballads and the games alike, Robin was always exhibited as a valiant man out of suits with fortune, giving to the poor much of what he took from the rich, most skilful with the long bow and the quarter-staff, and almost unflinchingly

victorious in personal encounters with whatsoever opponent.

In addition to these evidences of the existence of such a hero, we must remark that his grave has for ages been pointed to in Kirklees Park, Yorkshire, marked by a flat stone on which was carved a flowery cross.

While there could be little doubt that some such predatory outlaw as Robin H. once existed, and that he was of a character to excite, generally speaking, the affections rather than the reprobation of the people, there was a sad want of documentary evidence regarding him, until the publication of a tract by the Rev. Joseph Hunter in 1852. In this *brochure*, it is, first, shewn that one of the ballads represents Robin as going, by the invitation of 'Edward our comely king,' to meet him at Nottingham; as there accepting service with his majesty; and as accompanying him to court; where, however, becoming sick almost to death with that kind of life, he did not remain above 15 months; after which he retired, and resumed his wonted free and jovial life in the forest. Mr Hunter then proceeds to shew that King Edward II. in 1323 made a progress through the western and midland counties, in the course of which he came (November 9) to Nottingham; that in the exchequer accounts between March and November of the ensuing year, among the names of 24 'porteurs' of the king, to whom wages were paid, occur those of 'Robyn and Symon Hod;' and that finally, at the latter date occurs an entry—'Robyn Hod, heretofore one of the porteurs, because he could no longer work, received as a gift, by command, 5s.;' the name from this time appearing no more. Mr Hunter likewise ascertained that, at a date six years antecedent to the royal progress above mentioned, the name of 'Robertus Hood' is found in the court-rolls of the manor of Wakefield, as that of defender in a suit regarding a small piece of land. The probability therefore is, that Robin H. lived and acted as the ballads represent him only a few years before the era of Piers Ploughman, and really passed from wild forest life into the royal service for a brief space—an adventure which might appear as the most incredible attributed to him, if we did not know something of the whimsical and puerile character of Edward II., which was such that he did not disdain occasionally to seek amusement in playing at chuck-farthing with his servants. Mr Hunter further deemed it likely that H. was one of the yeomen who joined the discontented barons under the Earl of Lancaster, and were ruined by the failure of their enterprise. If so, his life in the forest might be rather a sort of guerrilla warfare than a practice of simple rapine; and hence it might, in some measure, arise that the 'gests' of Robin H. became the subject of so much romantic and affectionate sentiment on the part of the community.

HOOD, THOMAS, was born in London in 1798, and after leaving school was placed in the counting-house of a Russian merchant, but his health failing, he was sent to Dundee. At the age of 17, he returned to London, and engaged himself to learn the art of engraving with his uncle. In 1821, he was offered the post of sub-editor of the *London Magazine*, which he accepted, and at once entered upon its duties and an extensive literary acquaintance. His first separate publication was entitled *Odes and Addresses to Great People*. He published *Whims and Oddities* in 1826, of which a second and third series appeared during the two following years. In 1829, he commenced *The Comic Annual*, and continued it for nine years. He edited *The Gem* for one year, contributing to its pages his striking poem entitled *Eugene Aram's Dream*. In 1831, he went to reside at Wanstead in Essex, where

he wrote his novel of *Tylney Hall*; but pecuniary difficulties supervening, he returned to London in 1835. In 1838, he commenced the publication of *Hood's Own*, to which his portrait was attached. Health failing about this time, he went to reside on the continent, and remained six years. In 1839, he published *Up the Rhine*, the idea of which was taken from *Humphry Clinker*. On his return to England, he became the editor of *The New Monthly Magazine*, and on his withdrawal from its management in 1843, he published *Whimsicalities*, consisting chiefly of his contributions to that serial. In 1844, he started *Hood's Magazine*, and contributed to its pages till within a month of his death. During his last illness, Sir Robert Peel conferred on him a pension of £100 a year, which was transferred to his wife. He died on the 3d May 1845, and was buried in Kensal Green Cemetery. Compare *Memorials of Thomas Hood, Collected, Arranged, and Edited by his Daughter, with a Preface and Notes by his Son* (2 vols. 1860).

H. takes a high place both as a humorist and as a serious poet. He is great at once in comedy and pathos, and he sometimes curiously mingles and combines both. As a punster, he was supreme: he connects far-separated words and ideas by the most subtle analogies, and sends them loose. Much of his comedy, however, is verbal and shallow, and will be soon forgotten. It is as a poet that H. will be remembered. His *Eugene Aram's Dream*, *Song of the Shirt*, and *Bridge of Sighs*, are among the most perfect poems of their kind in the English language.

HOOD, VISCOUNT (SAMUEL HOOD), English admiral, was eldest son of the Rev. S. Hood, vicar of Thornecombe, Devonshire, at which place he was born, 1724. At 16, he entered the royal navy, was made lieutenant in 1746, and post-captain in 1756. In 1759, being in command of the *Vestal*, 32 guns, he engaged a French 50-gun ship, which he took after a desperate action of four hours. In 1777, he was made commissioner of Portsmouth dockyard, and next year received a baronetcy. He was then made rear-admiral, was sent to the West Indies to reinforce Rodney, and commanded a division in the engagement with the Count de Grasse, April 12, 1782. He was made a peer of Ireland by the title of Baron Hood. In 1793, he was made commander-in-chief of the Mediterranean fleet, and took possession of the port of Toulon; but the French Republican army, in great force, compelled him to evacuate it, after destroying or carrying away the principal part of the shipping, firing the arsenal and public stores. He then sailed for Corsica, which, after a campaign, he annexed to the crown of Great Britain. In 1796, he was advanced to the rank of a viscount of Great Britain, and made governor of Greenwich Hospital. He died at Bath, January 27, 1816.—His younger brother, ALEXANDER HOOD, served as rear-admiral under Lord Howe, was second in command at Lord Howe's victory of the 1st June 1794, obtained a victory over the French fleet in 1795, and was made, in 1796, Baron, and in 1801, Viscount Bridport. He died in 1814.

HOOD-MOULDING. See DRIPSTONE.

HOOF. (See HORNY TISSUES.) The healthy soundness of the horse's foot is mainly preserved by permitting it to grow uninjured by the rasp and knife (see HORSE-SHOEING), whilst its toughness is secured, and undue dryness and evaporation prevented, by smearing daily the crust, sole, and frog with a little glycerine, or a mixture made by melting together a quarter of a pound each of tar, honey, bees'-wax, and glycerine, with a pound of lard. Softness and brittleness of the hoof, which

are fruitful sources of cracks and Corns (q. v.), may be remedied by the regular use of such dressings, by placing the feet for several hours daily in thick woollen swabs, kept cool and moist by frequent applications of cold water, and by encouraging a more healthy growth of horn by occasional mild blisters round the coronary band. Cracks, or sand-cracks, as they are termed, mostly occur amongst horses much upon the road, cause lameness, and constitute unsoundness. When serious and recent, poulticing, thinning away of the crust about the crack, and perfect rest, are essential. After the earlier heat and tenderness are removed, a hot iron should be drawn at right angles to the crack, both above and below, so as to separate the diseased from the sound horn. Waxed thread or fine wire should be wound round the hoof, and a sound growth of horn stimulated by a blister round the coronet. The horse's hoofs are too hard and coarse to be employed for the making of the better class of combs and buttons, for which purpose the hoofs of cattle, to the value of nearly £5000, are annually imported. They are, however, largely used by manufacturers of prussiate of potash and artificial manures.

HOOF, PIETER, a Dutch historian and poet, was born at Amsterdam, 16th March 1581, studied at Leyden, and travelled in France, Germany, and Italy. He died at the Hague, May 21, 1647. The chief historical works of H. are *Het Leven van Koning Hendrik IV.* (Amst. 1626—1652), and *Nederlandsche Historien* (2 vols. Amst. 1642—1654; most recent edition, 1820—1823). The latter of these is still of the greatest value, and is considered one of the classics of Dutch literature. H. also translated Tacitus into Dutch. As a poet, his *Minnedigte* have not been surpassed, if even equalled, as specimens of the light Anacreontic muse. His *Letters* were published by Huydecooper in 1738. H. has exercised an important influence on the development of the Dutch language.

HOO'GHLY, a river of Bengal Proper, is formed, in lat. 23° 25' N., and long. 88° 22' E., by the junction of the first two offsets of the Ganges, the Bhagrutti and the Jellinghi. From the point in question, the stream, strictly so called, is 125 miles long; the estuary, as far as Saugor Roads, measuring 35 miles more. Of all the channels by which the Ganges reaches the sea, the H. is the most available for navigation. In the dry season, the tide is felt nearly up to Chandernagore, 17 miles above Calcutta. During the south-west monsoon, the H. is subject to the phenomenon known as 'The Bore' (q. v.). Up to Calcutta, the draught is seldom less than 17 feet; but the bottom is said to be silting up. At its entrance, too, the H. is much encumbered with shoals.

HOOGHLY, a city of Bengal Proper, stands on the right or western bank of the river Hooghly, 27 miles north of Calcutta, in lat. 22° 54' N., and long. 88° 22' E. It is estimated to contain 12,000 inhabitants. Here is a college for English and Asiatic literature, which owes its existence mainly to the munificence of a native; and in connection with this establishment are several schools.—The district of Hooghly contains 2089 square miles, and a population of 1,520,840.

HOOK, THEODORE EDWARD, a celebrated novelist and dramatic writer, was born in London, September 22, 1788, and educated at Harrow. In 1805, at the age of 17, he produced an operatic farce called *The Soldier's Return*, which was very successful; and between that year and 1811, he wrote twelve other operatic pieces and farces, all of which were popular at the time. His ready wit, sparkling

humour, and wonderful powers of improvisation, made him the delight of society; and having pleased the Prince Regent by his feats of mimicry, he was appointed (1813) accountant-general and treasurer of the Mauritius, with a salary and allowances amounting to nearly £2000 a year. These offices he held till 1818, when the discovery of a considerable deficiency in the military chest caused him to be arrested and sent to England, and his effects seized and sold. The speculation, it afterwards appeared, had been committed by his deputy, who destroyed himself. On obtaining his liberty, H. supported himself by writing for the newspapers and magazines, and on the establishment of the *John Bull*, weekly Tory newspaper, in 1820, he was appointed its editor. From his connection with this bold, clever, and, at that time, virulent print, he derived, during its prosperous state, fully £2000 a year. In August 1823, for his debt to the government, amounting to about £12,000, he was arrested under an Exchequer writ, and his property sold. He remained within the Rules of the King's Bench till May 1825, when he was released from custody. In 1824 appeared, in 3 vols. 8vo, the first series of his *Sayings and Doings*, which yielded him £2000. A second series followed in 1825, and a third in 1828, for each of which he received 1000 guineas. Several other three-volumed novels were published by him in rapid succession, such as *Maxwell*, 1830; *Love and Pride*, 1833; *Gilbert Gurney*, which contains a sort of autobiography of himself, 1835; *Jack Brag*, 1837; *Births, Deaths, and Marriages*, 1839; *Gurney Married*, 1839; &c. He died August 24, 1841.

HOOK, REV. WALTER FARQUHAR, D.D., son of the Rev. James Hook, Dean of Worcester, was born at Worcester about the beginning of the century, and educated at Christ-Church, Oxford, where he graduated in 1821. After holding some minor preferments in the church, he was appointed Vicar of Leeds in 1837, and a few years ago Dean of Chichester. The English Church does not possess a more zealous or laborious son. In 1856, Dr Longley, Bishop of Ripon, on taking leave of the clergy of his diocese, stated that twenty churches had been built in Leeds through the exertions of Dr H., while school-rooms had been provided for more than 10,000 children. H. is also an author of very considerable merit. Among his works are—*An Ecclesiastical Biography, containing the Lives of Ancient Fathers and Modern Divines* (8 vols. Lond. 1845—1852), *A Church Dictionary* (8th ed. 1859), *Sermons suggested by the Miracles of our Lord and Saviour Jesus Christ* (2 vols. 1847), *On the Means of Rendering more Effectual the Education of the People* (10th ed. 1851), and *Lives of the Archbishops of Canterbury* (2 vols. 1861).

HOO'KAH. See PIPE.

HOOKE, ROBERT, an English natural philosopher, born at Freshwater, Isle of Wight, July 18, 1635, was educated at Westminster school, and at Christ-Church, Oxford. In 1662 he was appointed curator of experiments to the Royal Society, and in 1677 became its secretary; in 1664, professor of geometry in Gresham College, London; and in 1666, surveyor for the city of London, a most lucrative appointment. He died at Gresham College, March 3, 1703. H. was a man of extraordinary inventive genius, and has justly been considered as the greatest of philosophical mechanics; the wonderful sagacity, nay, almost intuition, he shewed in deducing correct general laws from meagre premises, has never before or since been equalled. There was no important invention by any philosopher of that time which was not in part

anticipated by Hooke. His theory of gravitation subsequently formed part of Newton's; he anticipated the invention of the steam-engine, and the discovery of the laws of the constrained motions of planets. Among his own completed discoveries are, the law of the extension and compression of elastic bodies, '*ut tensio sic vis*;' the simplest theory of the arch; the balance-spring of watches and the anchor-escapement clocks; the permanency of the temperature of boiling water. The quadrant, telescope, and microscope are also materially indebted to him.

HOOKER, RICHARD, author of the Books of Ecclesiastical Polity, and one of the most illustrious of English theologians, was born in the city of Exeter, or its neighbourhood, about the year 1554. He was early distinguished for his 'quick apprehension of many perplex parts of learning,' and attracted the notice of Jewell, Bishop of Salisbury, through whose influence he was sent to Oxford about his 15th year. He was placed at Corpus Christi College. He was advanced first to the dignity of scholar, and then of fellow of his college. After about three years' residence in his college as fellow, he entered into sacred orders, and ere long was appointed to preach at St Paul's Cross. Hither all the power and eloquence of the church found their way in the 16th century. To H., however, the trial of such a public appearance was evidently considerable, according to Walton's account; and the more as the weather proved very unfavourable for his journey; 'but a warm bed and rest, and drink proper for a cold, given him by Mrs Churchman, and her diligent attendance added unto it, enabled him to perform the office of the day, which was on or about the year 1581.' Mrs Churchman's kindness proved too much for the simple-minded theologian. He was led, evidently without due consideration, into a marriage with her daughter. This marriage of H., as is known to all, was far from proving a source of happiness—a result that could scarcely have been expected from its commencement. Walton's description of the visit of his two old pupils, Edwin Sandys and George Cranmer, and 'Richard called to rock the cradle' from their company, is among the most characteristic sketches of this fine old writer. The visit was made to Drayton-Beauchamp, in Buckinghamshire, where H. had settled in 1584, as a country priest, after his marriage. He was transferred ere long to the mastership of the Temple, by the patronage of Archbishop Whitgift; and here he was plunged into the controversy with Puritanism, out of which his great work arose. Travers, one of the most zealous of the Elizabethan Puritans, was his colleague in the Temple. Travers was the more attractive and popular orator, if the less profound thinker. The union was not a happy one. The congregation 'ebbed in the forenoon,' Fuller tells us, 'and flowed in the afternoon.' 'Pure Canterbury' was in the ascendant in the morning, 'Geneva' in the afternoon. H. soon tired of the contention in the congregation, and the indifference of the majority to his ministry. He accordingly applied to the archbishop, who presented him, in the year 1591, to the rectory of Boscum, in the diocese of Salisbury, and six miles from that city. Here he remained for four years, busily employed with his great work, which his experience in the Temple probably prompted. The first four books of the Ecclesiastical Polity appeared in 1594. In the same year, he was transferred to the living of Bishopshorne, near Canterbury, where he spent the few remaining years of his life, and gave to the world the fifth book of the Polity. The remaining three books were posthumous. About the year 1600, in the 46th year of his age, he

caught cold in his passage from London to Gravesend, and gradually sunk under the weakness which followed.

H. will always be esteemed one of the most illustrious thinkers and writers, not only in English theology, but in English literature. He is alike comprehensive and profound, tranquil and eloquent. He is speculative without mysticism, and earnest without declamation. He searches all the depths and rises to all the heights of his subject, without ever forgetting the simplicity of the Christian or breaking the charm of catholic association that binds all its parts together. More than anything, he is wise and judicious in the highest sense of that word; and it is the light of lofty and calm wisdom, shining through his pages, that continue to make them a delightful and excellent study, when most of the contemporary theological works are forgotten.

HOOKER, SIR WILLIAM JACKSON, F.R.S., a celebrated English botanist, was born at Norwich in 1785. He was intended by his friends for a mercantile life, but his natural love of botany induced him to devote himself to that department of natural history. His first work was a *Journal of a Tour in Iceland* in 1811, which attained such popularity that a second edition was called for in 1813. From that time to his death in 1865, he was almost incessantly engaged in the publication of botanical works, which are far too numerous for a full enumeration in this article. His investigations on the British *Jungermanniæ* and Mosses led to his appointment to the chair of botany in the university of Glasgow, where he lectured with great success till 1841, when he resigned his professorship on being chosen director of the Royal Gardens at Kew, an office which he filled in a most efficient manner. Those only who recollect the state in which these Gardens were at the time of his appointment, can fully appreciate the improvements which were effected during his management. His name was enrolled in the lists of all the scientific societies at home and abroad; and he was knighted in 1836, on account of his high scientific acquirements. The following are some of the most important of his works: 1. *Monograph of the British Jungermanniæ* (1812—1816); 2. *Muscologia Britannica*, containing the mosses of Great Britain and Ireland (1818); 3. *Musci Exotici* (2 vols. 1818—1820); 4. *Flora Scotica* (1821); 5. *The Exotic Flora* (3 vols. 1823—1827); 6. *Icones Filicum* (in association with Dr Greville, (2 vols. fol. 1826—1837); 7. *The British Flora* (1830), a work that has gone through seven editions; 8. *Flora Boreali-Americana, the Botany of the Northern Parts of British America* (2 vols. 4to, 1829—1840); 9. *Illustrations of the Genera of Ferns* (1838—1842); 10. *A Century of Orchidaceous Plants*, (4to, 1848); 11. *The Botany of Captain Beechey's Voyages to the Pacific and Behring's Straits* (in conjunction with Dr Walker Arnott), (1831—1841); 12. *The Victoria Regia*; 13. *Icones Plantarum* (10 vols. 1837—1860); 14. *British Ferns* (1862); 15. *Garden Ferns* (1862).

HOOKER, JOSEPH DALTON, M.D., F.R.S., a distinguished living botanist, was born at Glasgow in 1816, and is the only surviving son of Sir William Jackson Hooker (q. v.). He was educated for the medical profession, and graduated as M.D. at the university of Glasgow; accompanied the antarctic expedition under Sir James Ross in 1839, nominally as assistant-surgeon to the *Erebus*, but in reality to study the botany of the regions to be explored. In the year 1843, he started on another expedition with the view of investigating a tropical flora, and spent about three years in examining the vegetation of the Sikkim Himalayas. He returned to

England in 1851, and shortly afterwards published his *Himalayan Journals*, in two volumes, which contain a large amount of scientific information on natural history, physical geography, and meteorology. The botanical collections he made in India were very valuable, the combined Herbaria of his fellow-traveller, Dr Thomson, and himself, embracing nearly 7000 species of plants, including an immense number of duplicates; and the number of new plants—especially of *Rhododendrons*—that have been introduced into our gardens in consequence of this expedition, is very considerable. He is assistant to his father at Kew, and one of the vice-presidents of the Royal Society. Besides various important papers in the *Transactions* of the Linnean and other learned societies, he has published the following botanical works: (1.) *The Botany of Sir James Ross's Antarctic Voyage*, including three separate works—viz., *The Flora of New Zealand*, *The Flora of Tasmania*, and *The Flora of Lord Auckland's Islands*; (2.) *Illustrations of Sikkim-Himalayan Plants*; and (3.) *The Rhododendrons of the Sikkim Himalaya*. No one since Humboldt has done so much as the subject of this notice to enlarge our knowledge of the geographical distribution of plants.

HOOKS AND EYES. These small articles are largely used in millinery for dress-fasteners, and are of great utility. Formerly, they were made by hand, the wire of which they are formed being bent into the proper shape with pliers; now, however, they are entirely made by machines of great simplicity and beauty. With a pair of them it is possible to make 200 hooks, and the same number of eyes, in one minute. The operations of the machines are, first, to draw the wire forward from the supplying reel, then cut off the length required for hook or eye, as the case may be; a sinker then descends and forces it into a slot, by which it is bent, and two projecting cams, acting at the same time on the two ends, bend them over so as to form the lateral loops used for sewing the hook or eye to the garment; then, in the case of the hook, it is passed under another sinker, which

forces the doubled wire into another slot, and forms the hook part; one side of the slot, being movable, is made to strike the bent portion of the hook sufficiently to flatten it. It is then complete, and drops out, to make room for another.

HOOK-SQUID, the name commonly given to cephalopod molluscs of the genera *Onychoteuthis* and *Enoplateuthis*, allied to the common squids or Calamaries (q. v.), but having the eyes destitute of any covering of skin. The arms have two rows of suckers; the tentacles much exceed them in length, and are furnished with hooks at their extremities. Hook-squids are found in the Sargasso Sea, in the Polynesian Seas, &c. They are much dreaded by swimmers and

Head, Arms, and Tentacles of Hook-squid.

divers, being often of large size—sometimes six feet long or more—whilst their hooks, their many arms,

their very numerous suckers, and their strong, sharp mandibles, entitle them to a place among the most formidable monsters of the deep.

HOOP ASH. See **NETTLE-TREE**.

HOOPER, JOHN, an English prelate and martyr, was born in Somersetshire about 1495, and educated at Oxford. By the study of the works of the German Reformers, and of the Scriptures, he was converted to Protestantism, and about 1540 he went to the continent, and spent some time in Switzerland. At the accession of Edward VI., in 1547, he returned to England, and became a preacher in London. In 1550, he was appointed Bishop of Gloucester, but his objections to wearing the Episcopal vestments caused some delay in his consecration. In 1552, he received the bishopric of Worcester in *commendam*. On the commencement of Mary's reign, in 1553, he was committed to the Fleet, where he remained for 18 months, being frequently examined before the council; but continuing firm in the Protestant faith, he was condemned as a heretic, and burned at the stake at Gloucester, February 9, 1555. He was the author of numerous sermons and controversial treatises.

HOOPING-COUGH, or **PERTUSSIS**, is an infectious, and sometimes epidemic disease, mostly attacking children, especially in the spring and autumn. Its earliest symptoms, which usually appear five or six days after exposure to infection, are those of a common cold, as hoarseness, a watery discharge from the eyes and nose, oppression of the chest, a short dry cough, and more or less feverishness. This stage, which is called the *catarrhal*, lasts a week or ten days, when the fever remits, and the cough begins to be followed by the peculiar whoop which characterises the disease, and which is caused by the inspiration of air through the contracted cleft of the glottis. See **LARYNX**. The disorder may now be regarded as fully developed, and consists of paroxysms of severe coughing, which usually terminate in the expectoration of glairy mucus, or in vomiting. During the fit of coughing, the face becomes red or livid, the eyes project, and the child seizes some person or object near him for support. These paroxysms occur at uncertain intervals, but usually about every two hours, and between them the child returns to his play, takes his food with good appetite, and exhibits little or no sign of illness. The disease reaches its height at about the end of the fourth week, after which the paroxysms diminish in frequency, and the patient shews signs of improvement. The second stage may last from two to eight weeks, and is succeeded by what may be termed the convalescent stage, the duration of which is very variable.

This is one of those diseases which seldom occur more than once in a lifetime; and hence it probably is that, as few children escape it, it is comparatively rarely noticed in adults. Morbid anatomy has failed to throw any direct light upon its special seat. The proportion of deaths to recoveries in cases of hooping-cough has not been satisfactorily determined, but when there is a severe epidemic, the mortality due to this disease is often very great; the deaths, however, in the great majority of cases, occur amongst the poorer classes. This mortality is, in reality, due rather to the bronchitis and pneumonia (or inflammation of the lungs), which are frequent complications of hooping-cough, than to the disease itself.

The treatment of hooping-cough, as long as it is uncomplicated or simple, should not be meddlesome. Nothing that can be prescribed in the early stages will check its natural course, and the object of the physician should be to ward off complications,

and to conduct the disease safely to its natural termination. The diet should consist of milk and unstimulating farinaceous matters. The bowels should be kept moderately open. If the weather is cold, the child should be kept in the house with the temperature of the room at about 60°. A grain, or a grain and a half of ipecacuanha may be given three or four times a day. Slight counter-irritants may also be applied to the surface of the chest; Roche's Embrocation, which consists of olive oil, with half its quantity of the oils of cloves and amber, is extensively used for this purpose. Nothing is so serviceable in the last or convalescent stage as change of air, often even when from a pure to a comparatively impure atmosphere; and next to this, the internal use of a solution of binoxide of hydrogen (see HYDROGEN, BINOXIDE OF) seems most worthy of trial.

HOO'POE (*Upupa*), a genus of birds of the order *Insectores*, tribe *Tenuirostres*, and family *Upupidae*. To this family are referred also the genera *Promerops*, *Epimachus* (Plume-birds), &c., natives of warm parts of Asia and its islands, Australia, and Africa, some of which are remarkable for magnificence of plumage. In the whole family, the bill is long and slender, the wings of moderate size or short, the legs short, the toes long, and the claws strong and curved. There are among them, however, great diversities, which have led some to divide them into two families, *Upupidae* and *Promeropidae*. The genus *Promerops* and its nearer allies have a close relation to the *Meliphagidae*, which they resemble in partly feeding on the sweet juices of plants, in order to which the tongue is extensile and divided at the tip. The hoopoes, on the other hand, exhibit many points of resemblance to the crow family, with which they are connected by the choughs, and some points of resemblance even to hornbills. The tongue is short, and not extensile.

Hoopoe (*Upupa epops*).

The COMMON H. (*U. epops*) is an African bird, a summer visitant of most parts of Europe, found also in some parts of Asia; not of frequent occurrence in Britain, although sometimes seen in autumn, very seldom breeding in any part of the island. It is about the size of a missel-thrush; its plumage exhibits a fine mixture of white, buff, and black; and it has a large crest of two parallel rows of feathers. The H. derives its name from its very frequent utterance of a low soft sound resembling the syllable *hoop*.

HOOPOE. See CRINOLINE.

HOORN, a decaying town and seaport of the Netherlands, in the province of North Holland, is agreeably situated on a bay of the Zuider Zee, 20 miles north-north-east of Amsterdam. It was at one time one of the most flourishing towns of its province; but, like all the towns of North Holland situated on the Zuider Zee, it has greatly fallen off in trade and prosperity. There are at H. extensive markets for butter and cheese, and fishing and commerce are carried on to some extent. Here the large nets for herring-fishing were invented. Pop. 8670.

HOP (*Humulus lupulus*), a perennial diœcious plant of the natural order *Cannabinaceæ* (q. v.), the only species of its genus. It has long rough twining stems, and stalked 3—5-lobed rough leaves, and is a plant of luxuriant growth and abundant foliage. The male flowers grow in loose branching axillary panicles, and consist of five stamens surrounded by a 5-lobed perianth. The female flowers are in *strobiles*, or cones, with large persistent, concave, entire scales, which enlarge as the fruit ripens. The part of the hop so much used in brewing, and

Hop (*Humulus lupulus*).

sold under the name of *hops* (q. v.), is the ripened cone of the female plant. Female plants alone, therefore, are cultivated to any considerable extent, it being enough if a few male plants are scattered over a field.

The oil of hops is sedative, anodyne, and narcotic; and hence the value of pillows stuffed with hops in cases of mania, sleeplessness, &c. The bitter principle is not narcotic, but it is tonic. The oil and bitter principle combine to make hops more useful than chamomile, gentian, or any other bitter, in the manufacture of beer; and hence the medicinal value of *extra-hopped* or *bitter* beer. The *tannic* acid contained in the strobiles also adds to the value of hops, and particularly as causing the precipitation of vegetable mucilage, and consequently the clearing of beer. The hop is first mentioned by Pliny as one of the garden plants of the Romans, who, it appears, ate the young shoots as we eat asparagus; and, in fact, many country people in England do the same at the present day. It is a native of Europe and of some parts of Asia, a doubtful native of Britain and of North America. It is more extensively cultivated in the south of

England than in any part of the world, but also to a considerable extent in Germany, France, Flanders, and Southern Russia, and now successfully in North America and in Australia and New Zealand.

The cultivation of the hop was introduced into England from Flanders in the time of Henry VIII., but did not become sufficient for the supply of the kingdom till the end of the 17th century. For some time after hops began to be used in brewing, a strong prejudice existed against the innovation; and parliament was petitioned against hops, as 'a wicked weed, that would spoil the taste of the drink, and endanger the people.' About 50,000 acres are now employed in the cultivation of hops, chiefly in the counties of Kent, Sussex, Worcester, and Hants; the two former counties producing the best hops in the world. Fields of hops are to be seen as far north as Nottinghamshire.

The hop requires a very rich soil, and its growth is promoted by the liberal application both of organic and mineral manures; although excessive manuring is prejudicial. It spreads rapidly underground by its roots, and is not easily extirpated where it has once been introduced. It is generally propagated by layers or cuttings, which usually grow for a year in a nursery before being planted out. In the plantations, they are generally placed in groups of three or four, at distances of from six to nine feet. Great care is necessary in fastening the stems to the poles when they begin to shoot, setting up any that may be blown down, &c. The stalks, or *bines*, are taken down from the poles after the hop-picking, and cut and removed, to be used as litter or as manure, for which purposes they are excellent. The fresh bines, which are cut to prevent undue luxuriance in summer, are dried for feeding cattle, and are as good as the best clover hay.

The fibre of the stems is employed to a considerable extent in Sweden in the manufacture of a coarse kind of cloth, which is strong, white, and durable; but the fibres are so difficult of separation, that the stems require to be steeped in water for a whole winter.

The hop-plant often suffers very much, and the prospects of the farmer are destroyed by the Hop Mildew, and by insect enemies, the worst of which are noticed in the following articles.

HOP FLEA (*Haltica concinna*), a very small coleopterous insect, not quite one-tenth of an inch in length, which often does much mischief in plantations in spring, devouring the tender tops of the young shoots. It is of the same genus with the turnip-flea (sometimes called turnip-fly), so destructive to turnips.

1. Hop Flea (*Haltica concinna*): a, natural size; b, magnified; c, a fore-leg; d, a hind-leg.

2. Hop Fly (*Aphis humuli*): a, natural size; b, magnified.

HOP FLY (*Aphis humuli*), a species of *Aphis* (q. v.) or plant-louse, important on account of the injury which in some seasons it does to hop-plantations. It is, indeed, the principal cause of the great

difference between the hop crop of one year and of another, causing the variations in price and the speculations for which the hop trade is notable.—The winged female is green, with a black head, and spots and bands of black on the body; the legs are long. A few winged females appear about the end of May, and wingless multitudes are sometimes to be seen by the middle of June, on the under side of the hop-leaves and on the stems. The fly is the great dread of hop cultivators, and no means have been found of arresting its ravages. Lady-birds and other insects render important service by devouring the aphides, and restraining their excessive multiplication. It is proposed, in Kirby and Spence's Entomology, that women and children should be employed to pick off the winged aphides on their first appearance.

HOPE, THOMAS, a distinguished author and patron of art, ancient and modern, was born in London about 1770. While still a youth, he travelled over a large portion of Europe, Asia, and Africa, and collected many drawings, chiefly of buildings and sculptures. In England, he first attracted attention by the splendid decorations which he bestowed on the interior of his mansion in Duchess Street, Portland Place, London, a description of which appeared in his book on *Household Furniture* in 1805, a work that completely revolutionised the taste of this country. In 1809, he published his *Costume of the Ancients*, the influence of which was undoubtedly very great. His essay on the *Architecture of Theatres*, belonging to the same year, also deserves mention. Three years afterwards appeared his *Modern Costumes*, and in 1819 his *Anastasis, or Memoirs of a Modern Greek at the close of the 18th Century*. This last work is his master-piece. It was published anonymously, and was said by many people to be a production of Lord Byron's, who was greatly flattered by the rumour. It is certainly a brilliant and erudite performance, but is tedious and obscure in many places. It wants the dramatic *vis* of a genuine work of genius, and is now hardly if ever read. The only other works of H. worth mentioning, are his essay *On the Origin and Prospects of Man*, a very heterodox but rather eloquent piece of writing; and a *Historical Essay on Architecture*, both of which were published posthumously. H. died February 3, 1831.

HÔPITAL, MICHEL DE L', was born at Aigueperse, in Auvergne, in 1505, studied law at Toulouse, and first made himself known as an advocate in the parliament of Paris, and after discharging various public functions, became chancellor in 1560, during the minority of Francis II. France at this time was torn by contending factions. The Guises, in particular, were powerful, ambitious, and intensely Catholic; and when one of the family, the Cardinal de Lorraine, wished to establish the Inquisition in the country, H. boldly and firmly opposed him, and may be said to have saved France from that detestable institution. He summoned the states-general, which had not met for 80 years, and, being supported by the mass of moderate Catholics, he forced the Guises to yield. His speech at the opening of the assembly was worthy of his wise and magnanimous spirit: 'Let us do away,' said he, 'with those diabolical words of Lutherans, Huguenots, and Papists—names of party and sedition; do not let us change the fair appellation of Christians.' He induced the assembly to pass an ordinance abolishing arbitrary taxes, regulating the feudal authority of the nobles, and correcting the abuses of the judicial system. In the following year, he secured various benefits for the persecuted Huguenots;

but politico-religious passions were too fierce and vindictive in France in those days to be satisfied with anything but blood; and in spite of the most strenuous efforts which H. could make, the nation was plunged in the horrors of civil war, ending rather in the success of the Guises, the political *ultramontanes* of their day. The old patriot, who loved France too well to be either Huguenot or ultramontane, went into retirement, where he heard the news of the massacre of St Bartholomew, a crime against both the unity of France and the rights of conscience, which broke his heart. He died 15th March 1573.

HOPKINS, SAMUEL, D.D., an American clergyman, and founder of the Hopkinsian theology, was born at Waterbury, Connecticut, September 17, 1721. Having graduated at Yale College in 1741, he studied theology with Jonathan Edwards, and from 1743 to 1769 was settled as pastor of Housatonic, now called Great Barrington, Massachusetts. He then removed to Newport, where he died December 20, 1803. His writings consist of a life of President Edwards, sermons, addresses, a work on the millennium, and a system of theology, republished in Boston, 1852. He is said to be the hero of Mrs Beecher Stowe's *Minister's Wooing*. He was remarkable for his simplicity, earnestness, and persevering industry, and his peculiar theological doctrines have been a source of controversy for a century.—HOPKINSIANS, those who adopt the theological opinions of Dr Hopkins, are not a distinct sect, but are pretty numerous in America, in some of the Christian bodies of which the tenets are generally Calvinistic. They hold most of the Calvinistic doctrines, and even in their most extreme form, but they entirely reject the doctrine of imputation, both the imputation of Adam's sin and of Christ's righteousness. The fundamental doctrine of the Hopkinsian system, however, is, that all virtue and true holiness consist in *disinterested benevolence*, and that all sin is *selfishness*—the self-love which leads a man to give his first regard even to his own eternal interests being condemned as sinful.

HOPS. The produce of the hop-plant (see *HOP*). The fruit is a little nut, not larger than a grain of mustard-seed, and between its outer shell and the kernel there is a small quantity of a peculiar granular substance called *Lupuline*, which also exists as a sort of efflorescence on the surface of the scales themselves; much of the value of the hop depends upon the abundance of this substance. The *lupuline* is not a mere powder, but each grain is a little organised cellular body, of an oval or round form, and, when seen under the microscope, having a reticulated surface. These lupulinic grains have been analysed by many chemists. The following is the result of the investigations of Payen, Chevallier, and Pelletau:

Volatile oil (oil of hops),	2.00
Lupuline (the bitter principle),	10.30
Resin,	50 to 55.00
Lignin,	32.00
Fatty, astringent, and gummy matters; osmazome, malic, and carbonic acids, several salts (malate of lime, acetate of ammonia, chloride of potassium, sulphate of potash), &c.	Traces.
	99.30

The first year the bines, or stalks, are weak, and have to be provided with poles. When the bines die down in autumn, they are cut off, and the sticks removed or stacked, and during the winter the ground is forked over and manured. The plants are in perfection the third year, when each requires a pole about 18 or 20 feet in height, to

which the young bines are tied as they grow, with rushes or bast. They, however, soon begin to twine around the poles, and then require no more tying. In the English hop-grounds, the picking begins about the middle of September. This is done by women and children chiefly, some men being necessary to lower the poles and bring the hops within reach. As the hops are picked, they are taken to the *oast*, or hop-kiln, in which they are dried, usually on horizontal screens of hair-cloth, through which the heat of the kiln passes. This operation requires to be performed with great care, as the essential oil is very liable to be volatilised, especially as the hops are frequently kept from year to year. When fully dried, they are carried to the packing-house, and are there pressed into the bags or pockets, and sewed up ready for sale.

The best varieties of the hop are, the Hill Golding, the East Kent Golding, Golden Hops, Jones' Hops, Grape Hops, and Farnham White Bine.

The Goldings are the best and richest, and are used for the finest ales. The Jones' are most valued for their habit of short growth, which enables the grower to use shorter poles. The Colegates are very hardy, and can be grown on a poorer soil than the others. The grape hops are also very hardy, and will do on an indifferent soil; they are also very prolific.

We also receive them of excellent quality from Canada and the United States. Until the present year (1862), hops have paid an excise duty, and have formed an important part of the revenue, although a very variable crop, owing to the serious check it is liable to from insects, fungi, diseases, and the weather. The average payment for duty for the last ten years has been about £200,000, from about 80,000 acres of land cultivated with this crop. The import duties have been nearly £50,000. The duty is now removed, and it is highly probable that the cultivation will be very greatly extended.

In a carefully conducted experiment, Dr Ives obtained 14 ounces of lupuline from 6 pounds of hops; and as he was sure that he had not removed it all from the scales and nuts, a fair conclusion was drawn that the lupuline constitutes a sixth of the whole weight of the best hops. Both the bitter taste and the preservative character of hops are supposed to depend entirely upon this material, whether in the form of fully developed lupuline grains, or diffused in an undeveloped state in the structure of the scales. It is, therefore, of the utmost importance not only to encourage the development of the lupuline by good cultivation, but it is equally desirable to make the best use of it when produced. In furtherance of this, many of the principal English brewers now use an ingenious machine made by Mr Handyside of Derby, which first shakes off and sifts out the lupuline grains, and then separates the nuts or seeds from the scales. The reason for this separation is this: Experience has shewn that much of the aromatic principle of the lupuline is dissipated at a boiling heat; therefore only the scales are so treated, whilst the free lupuline is mashed with lukewarm wort, and the nuts, after being crushed, are treated in the same manner, and all are added together when cold. By this means, the aroma is fully developed, and a smaller quantity of hops is found to answer fully.

There is a narcotic principle in hops as well as the bitter and tonic, all of which have led to their employment in medicine. Such use is, however, very limited. For the full details of their employment in the process of brewing, see *BEER*.

HORATIUS FLACCUS, QUINTUS, the renowned Roman satirist and lyricist, was born at Venusia, in Apulia—in the country now called the *Basilicata*,

lately forming part of the kingdom of Naples—on the 8th December, 65 B.C. His father, who had been born a slave, but manumitted before the poet's birth, was a *coactor* (a collector of money for tax-gatherers and bankers), by which employment he had become a proprietor on a modest scale in his native district. Early seeing the genius and promise of his son, he resolved to devote his whole means to his education, and removing to Rome for the purpose, he gave him the culture usually bestowed on the children of the highest classes. Having finished his youthful studies at Rome, he was engaged on higher ones at Athens, when the assassination of Julius Cæsar threw the whole Roman world into confusion, and dragged H. himself—in his 21st year—into the civil war which followed. Brutus coming with Cassius to Greece, made H. a tribune, and he served with the republican leaders in that rank until the fatal field of Philippi put an end to their campaign. Brutus and Cassius destroyed themselves. H. made his submission, and returned to Rome. With what was left of his patrimony he bought the office of public scribe, and while living by this humble place, devoted his energy to literary creation. Thoroughly accomplished in Greek and Roman literature, he set himself to two great tasks—the naturalisation in Latin of the Greek lyric spirit, and the perfect development of the old Roman satire. It is his complete artistic success in both objects which has made him one of the most influential writers of the world, and which will secure his fame as long as order or culture exist upon the globe.

H.'s first known labours were satires and epodes—the epodes being imitations of the Greek satirist Archilochus. But it is probable that he early began to imitate the other great Greek lyricists; and it is certain that his first success was derived not from the public but the private circulation of his works. He made the friendship of Virgil, whose rise preceded his own, and of Varius; and Virgil and Varius introduced him to Mæcenas when he was about 26 years old. That great Etruscan noble and friend of Augustus became the good genius of the poet's life. He endowed him—at some period not exactly known, but before 33 B.C.—with a farm near Tivoli, in the Sabine country, established his independence, fostered his fame, sought his intimacy, loved, honoured, and encouraged him as much as one man could another. The friendship of Mæcenas led to that of Augustus, and H. enjoyed all his life (he died at 57) the consideration of the greatest persons of his time. He shews his gratitude for such favour in many passages of his poems, but he is never servile, and he compliments the emperor himself only on those features of his reign which have tended to secure him the gratitude, or, what was not less needed, the forgiveness, of posterity.

It is impossible, in our brief space, to discuss the vexed question of the chronology of H.'s poems, or to notice a fiftieth part of what has been written on it. But if we cannot be sure of the chronology of the poems, they give us themselves ample means for judging of the character of the poet. Even his personal appearance is familiarly known to us. He was a little, round, dark-eyed man, prematurely gray-haired, and inclined to corpulence; in dress somewhat slovenly, and apt to be abstracted in his gait and manner. He was kindly, friendly, and honourable—irascible, but easily appeased—of amorous and generally sensual temperament, yet fully sensible of both the dignity and the prudence of moderation. His philosophy was Epicurean, like that of most Roman men of the world of his age; but he had both an eye

and a heart for the noble in history and in life, and his most discerning readers cannot but see that there was a latent fund of earnestness and even piety in his nature, to which his poetry never gave full expression. The real key to his genius, is to study him as essentially a philosophical wit and moralist, who had an exquisite faculty for lyrical creation, and was a finished artist by dint of practice in it, but who primarily belonged to the philosophical rather than to the poetic class of minds. Some strict modern critics have doubted his being a poet at all, which, since he could produce all the effects of poetry, is plainly nonsense. The latest criticism, however, decidedly tends to place his lyrical works—as imitations of the Greek, and echoes of the natural notes of an earlier and more poetic age—farther below his *Satires* and *Epistles* than it was once customary to rank them. Meanwhile, this neither robs the *Odes* of their value, nor of their charm, nor of their merit. Their value, as representing an older literature which only exists in fragments, is immeasurable. Their charm, as breathing now all the gaiety, now all the sadness, of the ancient pagan mind, is irresistible. And their merit, even as imitations, implies a delicacy of insight, a fineness of touch, a power of minute finish, which has been exhibited by very few writers in the whole history of art. They are, indeed, perpetual models of construction, equally valuable to poets of every school, and were not less carefully studied by Wordsworth than by Pope. Great, however, as is the merit of the *Odes*, that of the *Satires* and *Epistles* is still higher. The native Roman satire—an indigenous product of Italy, as Casaubon has irrefragably established—was developed by H. into a branch of composition peculiarly his own, and in his own species of which he has never had a rival. He ridicules the follies of the world from the point of view of a man of the world, playing round vice like a picador round a bull; and though his morality does not rise above the level of a prudential moderation abhorrent of extremes, he enforces this with so much soundness, dramatic liveliness, and gay vivacious humorous wit, that the pulpit has profited by him not less than the author's study, and he has been the favourite of ecclesiastical dignitaries and statesmen, while also being the pocket-companion of men of letters and epigrammatists. The *Epistles* contain the graver element of the *Satires* in still greater perfection, and with the addition of a fine vein of personal emotion and affection, tinged occasionally with the melancholy of advancing life, which, on the whole, makes them the most valuable of H.'s works.

The literature of H. in modern Europe is enormous, and can only be glanced at here in the briefest manner. The *Editio Princeps* appeared at Milan in 1470, in 4to, and was followed by a long line of editions. In modern times, Orelli has taken a leading place as Horatian editor, and since him, Dillenburger has been justly popular; while England has contributed to the subject, among many other works, the valuable *Horatius Restitutus* of Tate, and the sumptuous volume of Dean Milman. Among the English translators of H., in the whole or in part, are found Ben Jonson, Milton, Atterbury, Pope, Warren Hastings, and Cowper, while Pope's *Imitations* occupy a distinguished place of their own. The best known translation of the whole of H. in English, is that of Francis, but his day is fast going by. Excellent translations have been issued in our own time by Mr Theodore Martin, Mr H. G. Robinson, and Lord Ravensworth; and a curious one, shewing much power, by Professor Newman, whose theory of

translation, however, has led him into frequent oddities and singularities.

HORDEIN, a term that has been applied to a substance that can be extracted from barley, but which is merely a mixture of starch, cellulose, and a little nitrogenous matter of unknown composition.

HORDEUM. See **BARLEY**.

HOREB. See **SINAL**.

HOREHOUND (*Marrubium*), a genus of plants of the natural order *Labiatae*, having a tubular 10-ribbed calyx, with 5 or 10 spiny equal teeth, 4 stamens included in the corolla, the upper lip of the corolla erect, the lower lip 3-cleft. The species are mostly perennial, herbaceous plants, natives of the south of Europe and the East. One species, the **COMMON or WHITE H.** (*M. vulgare*), is a native of

Horehound (*Marrubium vulgare*).

Britain, and is found generally throughout Europe, except in the more northern regions, growing in waste places, waysides, &c. It is about 1—1½ feet high, bushy, with roundish, ovate, crenate, wrinkled leaves, and almost globose whorls of white flowers. The whole plant has a whitish appearance, from the down with which its leaves are covered. It has an aromatic but not very agreeable smell. It is tonic, stimulant, and laxative, and is much used in coughs, being a popular remedy, and a very safe and efficacious one. It was formerly also employed in affections of the womb and of the liver. It is administered in the form of an infusion, or made into a syrup with sugar, and sometimes the syrup is candied. The name *H.* belongs also to another plant, a native of Britain, *Ballota nigra*, sometimes called **Black H.**, a fetid plant, also of the order *Labiatae*, and of a genus very closely allied to *Marrubium*. It closely resembles the **White H.** in taste, and possesses similar medicinal properties.—A third British plant, *Lycopus Europæus*, a diandrous plant of the same natural order, is sometimes called **WATER HOREHOUND**. It is also known as **Gypsy-wort**.

HORIZON, the circular line formed by the apparent meeting of the earth and sky; this, in astronomical phrase, is called the *sensible horizon*. The *rational horizon* is the circle formed by a plane passing through the centre of the earth, parallel to the sensible horizon, and produced to meet the heavens.

HORN, CAPE. See **CAPE HORN**, or **HOORN**.

HORN, a musical instrument, commonly called in this country the **French Horn**; in Italy, **Corno**; in France, **Cor de Chasse**. Its form is that of a long tube of brass, with a large bell-shaped ending. For greater convenience the tube is coiled up into four continuous circles, lying side by side, the coils being soldered together, to keep them in their position. It is sounded by means of a mouth-piece, in form like a little hollow cup. The thinner the sheet-brass is, of which the horn is made, the more easily can the sound be produced. The sounds obtained on the horn are the harmonics of the sound of its whole length, a fundamental sound which cannot be produced by the mouth. As those sounds form only a limited scale, the notes wanting are artificially made, by the hand being inserted into the bell, so as to flatten a higher note down to a lower one. These flattened notes are called **stuffed notes**, as the sound of them is muffled. The horn, in its natural state, can only be played in one key; but by means of crooks, which are added to increase the length of the tube, it can be transposed into any key. When at its greatest length, the horn measures, from the mouth-piece to the end of the bell, 16 feet. The music for the horn is always written in the key of *C*, with the key of the composition marked at the beginning of each movement; thus, **Corno in D**, &c., guides the performer as to the crooks he must use, in

French Horn.

order to play the notes in the key indicated. The stuffed notes on the horn being very defective in quality of sound, in comparison with the great beauty of the open notes, many inventions have been, from time to time, tried to remedy them. The most successful invention is the **valve-horn**, which is constructed so that the performer can, by means of three valves, lengthen or shorten the tube, so as to produce any note in the chromatic scale, as a harmonic of the length of the tube, and consequently all of the notes are of the same quality of sound, and open notes. The valve-horn is now generally used as a solo instrument with greater effect than the common horn. As an orchestral instrument, the horn is of great importance. There are never less than two horns in an instrumental score, and in many great works four horns are absolutely necessary. The date of the invention of the horn is lost in antiquity.

HORN MANUFACTURES. The horns of various animals are employed for useful and ornamental purposes. The principal are those of the ox, buffalo, and two or three species of deer, and of sheep and goats. Horn can be softened and split into thin laminae, or pressed into moulds; and as it recovers its peculiar character of flexibility, toughness, and transparency, when cold, it is particularly adapted for a great variety of purposes. It can also be dyed

various colours. Solution of gold in aqua regia, dyes it red; solution of nitrate of silver in nitric acid, black; a paste of red-lead, made with a solution of potash, colours it brown; so that, with a proper arrangement and application of these materials, the most admirable imitations of the much more costly tortoise-shell can be produced. The more common vegetable dye-stuffs, as logwood, Brazil-wood, barwood, saffron, indigo, &c., will also colour it, but neither so permanently nor so brightly as the metallic materials. By long-continued soaking, the horns of all the animals above mentioned, except the deer, can be softened, and those of the sheep and goat can be easily split into several layers when they have been soaked and boiled; and these layers can not only be flattened out by putting them between smooth iron plates heated and placed in a press, but if the edges of two or more are brought together between polished copper plates, and these tightly screwed together with a hand-vice, and plunged for some time in boiling water, and thence into cold water, the edges will be found firmly welded together, and the same property enables the horn-worker to use up the smallest cuttings with profit. Another valuable property of horn is, that when heated it can be pressed into a die, and not only takes a beautifully sharp impression, but if left in the die until cold, it retains it. In this way, then, it is employed in making handles for umbrellas, knives, forks, &c., and even ornamental boxes, and a variety of other articles. Combs are made out of the flattened sheets, and beautiful carvings are made out of the solid parts of the buffalo-horns brought in such vast numbers from the East Indies. Ox-horns, too, are sometimes of fine quality and colour, and are fashioned into drinking-cups, and other articles, often highly ornamental. Deer-horns, which, strictly speaking, are bone, have a very limited application; they are employed in this country for making knife-handles, called buck-horn, in much favour for pocket-knives; but on the continent the horns of the fallow-deer are extensively used in making the deer-horn articles of furniture peculiar to Germany. The deer-horns used in Great Britain are chiefly those of the Axis (*Axis maculata*), of which at least 100,000 are annually imported from the East Indies. From the same country are brought to Britain 800 tons of buffalo-horns, whilst from South America and other parts, the importation of ox and cow horns exceeds a million annually.

HORN-WORK, in Fortification, is a work having one front only, thrown out beyond the glacis of a fortress; with a view, 1. To strengthen a weak salient in the general outline; 2. To occupy a plateau in advance of the place, or to protect buildings, the including of which in the original enceinte would have extended it to an inconvenient degree; 3. To occupy a tongue of land protected on its sides; 4. To bar a defile; 5. To cover the head of a bridge; 6. To occupy rising ground, the possession of which would render the enemy more than necessarily dangerous. The front of a horn-work consists of two demi-bastions connected by a curtain, and usually defended in front, as in the fortress itself, by tenaille, ravelin, and covert-way. The flanks, protected by ditches, run straight upon the ravelin, bastion, or curtain of the main defences, so that the ditch may be swept by the fire of the latter. The flanks should not be too long for easy musketry range.

In most of the earlier works of this nature, the ditch of the horn-work was united with the ditch of the main works by being cut through the glacis and covert-way, but in modern works the horn-work is constructed entirely beyond the glacis, as the annexed figure shews. The masonry wall is

shewn in the figure by a thick black line at the head of the horn-work and immediately beyond

A, Horn-work, covering a Bastion, B.

the glacis, but at times it is merely a straight wall thrown across, as in the dotted line.

Occasionally, horn-works are very useful; but modern engineers generally prefer constructing detached and advanced works. A double horn-work becomes a *Crown-work* (q. v.).

HORNBEAM (*Carpinus*), a genus of the natural order *Cupulifera*; consisting of trees with compact, tough, hard wood; bark almost smooth and of a whitish-gray colour, deciduous leaves, and monocious flowers. The male catkins are cylindrical and sessile, their flowers consist merely of a little scale-like bract and 12—24 stamens. The female flowers

Hornbeam (*Carpinus Betulus*).

consist of a germen, crowned with the 4—8-toothed border of the perianth, and with two thread-like stigmas, and are placed in loose slender catkins, always two together, each at the base of a stalked bract, which is three-cleft or three-cornered, and

which, when the tree is in fruit, enlarges very much, becomes leafy, and covers the fully ripened nut on one side. The nut has a thick husk, and is small and striated. The COMMON H. (*C. Betulus*), very frequent in the woods of many parts of Europe, is a beautiful tree, attaining a height of 60—100 feet. It is seldom, indeed, now seen of such dimensions in Britain; but it seems to have formed a principal part of the ancient forests of some parts of the island. It has elongato-ovate, acuminate, almost triply serrate leaves. When in fruit, it has very large, deeply 3-partite bracts. It thrives best in a moderately moist and shady situation. Its root descends deep into the ground. The wood is white, very hard, uncommonly strong and tough, and therefore suitable for bearing heavy strains. It is much used by joiners, turners, and wheelwrights. It takes a very fine polish, and, when well stained, might readily be mistaken for ebony. In the earth, or where exposed to the changes of the weather, it is of no great durability. It burns like a candle, and it is one of the best kinds of firewood; it affords an excellent charcoal, and the ashes yield much potash. The young stems, by reason of the dense growth of their twigs, are very suitable for forming live-fences and bowers; and as it bears clipping very well, the H. was often employed to form those live-walls which were formerly so much the fashion in gardens.

HORNBILL, the name of a genus (*Buceros*) and of a family (*Bucerotidae*) of birds, to which Cuvier assigned a place in the syndactylous division of the order *Insectores*, but which some naturalists rank with crows in the tribe *Controstres*. Their anatomical structure has been found to indicate affinities both with crows and toucans, and the same inference may be drawn from their habits. The species are numerous; they are natives of Africa

Hornbill (*Buceros Rhinoceros*).

and the East Indies. They are mostly large birds, some nearly as large as a turkey, the smallest rather smaller than a magpie. They are remarkable for the enormous size of the bill, and for a large bony protuberance with which it is generally surmounted. The bill is curved, broad at the base, compressed towards the tip; the bony protuberance on the upper mandible assumes different forms in different species. They may be described as omnivorous.

HORNBLENDE, a mineral allied to Augite (q. v.), and containing from 40 to 60 per cent. of

silica, with variable quantities of alumina, lime, oxide of iron, soda, potash, and fluorine. H. is found in granite, syenite, and other igneous rocks which contain quartz or free silica. It is particularly abundant as a constituent of syenite. It is sometimes found in considerable masses, and even in beds of slaty structure (*H. slate*). The variety called COMMON H. is generally green or black, more rarely brown or gray. It contains a pretty large proportion of protoxide of iron; is generally massive, but sometimes crystallises in oblique four-sided, or in six-sided prisms. The crystallised H. is sometimes called *Black Schorl*, and is capable of being made into ornaments.

HORNCastle, a market-town of England, in the county of Lincoln, is situated in an agreeable district at the foot of the Wolds, 20 miles east of Lincoln. The parish church is the most interesting of the public buildings; portions of it were erected during the reign of Henry VII. There is a considerable trade here in corn and wool; and of the three annual fairs, that held in August lasts for ten days, and is one of the largest horse-fairs in Britain. There are at H. remains of a Roman fortification; coins and other antiquities are occasionally found in the neighbourhood. Pop. (1871) 4865.

HORNE, REV. THOMAS HARTWELL, D.D., an English biblical critic, born October 20, 1780, was educated at Christ's Hospital, and afterwards became clerk to a barrister. His leisure hours were devoted to the study of the Bible, and in 1818 he published his *Introduction to the Critical Study and Knowledge of the Holy Scriptures*, a work which procured for him admission into orders without the usual preliminaries. Subsequently, St John's College, Cambridge, granted him the degree of B.D., and two American colleges that of D.D. In 1833, he obtained the rectory of St Edmund the King and St Nicholas Acons, London. He was also made a prebendary of St Paul's Cathedral. In the course of a long life, H. published a great variety of works, but the one already mentioned is the principal. From the first moment of its appearance, it not only became popular, but attained the dignity of being considered the text-book on the subject in all or almost all the theological colleges of Great Britain and America. It has gone through ten or eleven editions, and has been frequently improved, so that it still retains the high reputation which it originally bore. He died February 1862.

HORNET (*Vespa crabro*), the largest species of wasp found in Britain. It is not uncommon in

Hornet (*Vespa crabro*).

some parts of England, but is not found in Scotland. The thorax is mostly black, the fore-part rufous; the abdomen is yellow, with three brown points on

each segment. The sting is very painful. The H. is a very voracious insect, seizing and devouring bees and other insects, and carrying them to its nest to feed its young. The nest is in a hollow tree, in an outhouse, or in some other sheltered place. The community is not supposed ever to contain more than about 200 individuals, all deriving their origin from a single female, which, having survived the winter in some sheltered hiding-place, lays the foundation of the nest in spring. The nest is a curious structure, of a substance resembling coarse paper, and, except as to size, pretty similar to that of the common wasp. The community consists of females, males, and neuters or workers, as in the case of bees, but there are numerous females. Most of the males and neuters perish on the approach of winter, some of the females alone surviving.

HORNING, LETTERS OF, a writ in Scotch Law, which issues to compel a party to execute or carry out a judgment or decree of the court. The writ was formerly the only form of enforcing civil decrees by imprisonment, except in the case of small-debt decrees. But by recent improvements, the process is shortened, and other forms are more used.

HORNITOS, or **HORNOS** (Span. *ovens*), the name given to the low oven-shaped hillocks which emit smoke and vapours, and which occur in great numbers on the sides and in the neighbourhood of the large volcanoes of South America.

HORNPIPE, a musical instrument, consisting of the common wooden pipe with the necessary holes for producing the notes, and with a horn on each end. The performer blows into one of the horns, and the sounds of the pipe proceed out of the other. In the north-west of England, where this instrument is mostly found, it is used to accompany a national dance which is also called the Hornpipe. The melody of this dance is always in triple time—that is, in $\frac{3}{4}$, or $\frac{3}{8}$, and sometimes in $\frac{3}{2}$ time—and it consists of two parts of four or eight bars each, with repeats. The movement of the dance is tolerably quick.

HORNS are appendages to the frontal bones of many of the extensive family of ruminants, and are obviously intended as weapons of defence. In the genus *Cervus* (deer), the horns (known also as antlers) are solid, uncovered by epidermis, bone-like in composition, and deciduous. In the genus *Camelopardalis* (the giraffes), we have the single example of solid persistent horns completely invested with a hairy integument. In the other horn-bearing ruminants—as the ox, sheep, goat, and antelope—the horns are hollow, uncovered by epidermis, are composed of a special tissue (**HORNY TISSUES**, q. v.) quite different from bone, and are persistent. In all these cases, the horns are attached to the cranial bones; and in all the hollow horns, excepting those of the antelope, the osseous axis is hollowed out into cells communicating with the frontal sinuses, and thus admitting the atmospheric air into the interior. The horn of the rhinoceros is quite distinct in character from the horns in any of the ruminants. It is a tegumentary, not an osseous appendage, and is usually described as if it were a mass of hairs which had coalesced. It consists, however, in reality, of an aggregation of tubes, round which the horny matter is arranged in concentric laminae, as in the horny excrescences on the inner surface of the leg of the horse. The first and the third variety—viz., the antlers of the *Cervidae* and the hollow horns of the ox, &c.—alone require special notice.

The deciduous horns of the *Cervidae* at different ages, and their process of growth, are explained in the article **DEER**. To that description, it need

only be added, that these horns are formed on two well-marked morphological types—one group possessing rounded antlers, such as occur in the roebuck and the red-deer, and the other having the antlers more or less flattened, as in the elk and fallow-deer. A remarkable sympathy exists between the generative organs and the horns; and the development of the latter may be arrested, and their periodical shedding may be prevented by castration. As a general rule, it is only in the male *Cervidae* that horns are developed. In the reindeer, however, they are common both to the male and female.

In the hollow-horned ruminants, the bony protuberances or 'cores' arising from the frontal bones, and supporting the horns, instead of branching like antlers, form more or less solid cylindrical shafts, the surface being protected by ordinary Periosteum (q. v.), and by an extension of true skin, which becomes developed into a dense horny sheath. In the accompanying figure, the horny sheath is detached from the right horn, so as to shew the 'core' in the interior.

Front View of the Skull of the Ox, with the right Horny Sheath detached from the Core.

The horns of ruminants are almost invariably two in number, but exceptions occur in the case of the extinct *Bramatherium* and *Sivatherium*, and amongst living species, in the Four-horned Goat, the Many-horned Sheep, &c. In the Prong-horn Antelope there seems to be an approach to the cervine type, there being a prong of some length about half way up the horn, which may be regarded as analogous to the brow-antler.

HORNY TISSUES were formerly regarded as extremely simple in their structure, and as being only different forms of a substance to which the term *keratin* (from *kēras*, a horn) was applied. Recent investigations, however, shew that the parts which consist of horny tissue—as, for example, the persistent horns of the ruminants, the epidermis, the nails, claws, and hoofs, whalebone, tortoise-shell, &c.—have a somewhat complicated, and, in some respects, a variable structure, although they are so far analogous to one another that they proceed from nucleated cells which are not morphologically developed like the cells of most other organs, but which, to a certain extent, dry up and are only agglutinated together by an intercellular substance. In a chemical point of view, they also closely resemble one another, for when compared with other tissues they all contain a large quantity of sulphur, in combination with a substance whose origin from, or affinity with the Proteine Bodies (q. v.), is sufficiently obvious from their behaviour towards certain re-agents (the caustic alkalies and the mineral and acetic acids, for example), and their percentage composition.

The accompanying figure represents a longitudinal section of cow's horn (magnified 410 diameters) taken perpendicularly to the surface, kept for four hours in concentrated potash solution, to

which water was then added. If, however, a section of horn is examined in its natural state, it appears to consist of numberless bundles of fine threads

Horny Tissues :

a, cell of the under layer;
b, cell of the upper layer;
1, nucleus of the latter.

every horny tissue contains at least three different kinds of substances—viz., 1. The substance of the cell-membranes, which is exceedingly difficult of solution in alkalis, and which forms the principal part of the tissue; 2. The cell-contents, which dissolve more readily in alkalis; and 3. A connecting, or true intercellular substance.

These tissues have been submitted to ultimate analysis, after having been previously digested in water, alcohol, and ether. The analogy of their composition is shewn in the following tabular view :

	Hair.	Horse's Hoof.	Cow's Horn.	Nails.	Epi-dermis.	W hale-bone.	Tortoise-shell.
Carbon,	50.65	51.41	51.03	51.09	50.28	51.86	54.89
Hydrogen,	6.36	6.96	6.80	6.82	6.76	6.87	6.56
Nitrogen,	17.14	17.46	16.24	16.90	17.21	15.70	16.77
Oxygen,	20.85	19.94	22.51	22.39	25.01	21.97	19.56
Sulphur,	5.00	4.23	3.42	2.80	0.74	3.60	2.22

These tissues differ slightly in the quantity of inorganic matter which they contain, but the difference does not vary much beyond 1 per cent.

Hair yields from 0.54 to 1.85 per cent. of ash, containing, amongst other ingredients, peroxide of iron and a little silica. In feathers, the quantity of silica is very considerable, and it is doubtless to this constituent that the shaft in a great measure owes its strength and hardness.

HOROLOGY (Gr. *hora*, a defined portion of time) is that branch of applied science that has for its object the measurement of time. Although it is easy to look back on a period when time, according to the modern conception of it, as measured by hours, and minutes, and seconds, was unknown, yet we find progress early made in the measurement of larger periods of time, by observations of the heavenly bodies; and although, in the later progress of astronomy, it is found that the movements of the more conspicuous heavenly bodies do not afford accurate marks for the equable measurement of time, they were, for practical objects, sufficient, and afforded at least a better measure of time than any other phenomena which came under the observation of mankind. Thus, time was early divided into years, according to the motion of the sun among the constellations; into months, according to the motion of the moon relatively to the sun's place in the heavens; and into days, by the alternate light and darkness caused by the rising and setting of the sun. It was long, however, before any accurate measure was found for a division of the day itself. The earliest measure employed for this purpose that we can trace is the shadow of an upright object, which gave a rough measure of time by the variations in its length and position. This easily suggested the invention of Sun-dials (q. v.). Another

means early adopted for the measurement of short periods of time was by the quantity of water discharged by dropping from one vessel into another. Instruments for the measurement of time on this principle were called Clepsydre (q. v.). The running of fine sand from one vessel into another was found to afford a still more certain measure, and hence the invention of Hour-glasses (q. v.). King Alfred is said to have observed the lapse of time by noting the gradual shortening of a lighted candle. It is not very easy to trace to its source the history of the invention to which the modern clock owes its parentage; the earliest, however, of which we have a complete description, and perhaps the earliest which attained any distinct superiority to the rude machines already mentioned, was the clock of Henry Vic or De Wyck, a German, erected in the tower of the palace of Charles V., king of France, in 1379. A sketch of this clock, which is subjoined, will be useful not only from its historical interest, but also because, from its comparative simplicity, it will form a groundwork for further explanation of the mechanism of clocks and watches in their more complicated forms. It will be readily understood, from a glance at the annexed figure, that as the weight A tends to uncoil the cord and set in motion the cylinder B round its axis, the motion will be successively communicated to the various toothed wheels in the figure, and finally to the crown-wheel or escapement-wheel, I; the teeth of which so act on the two small levers or pallets, i, h, projecting from, and forming part of the suspended upright spindle or vertical axis, KM, on which is fixed the regulator or balance, LL, that an alternating or vibratory, instead of a circular, motion of the balance itself is the result. The hands of the clock are attached to the wheel N, also set in motion by the cylinder B. Now, unless there were some check upon the motion, it is manifest that the heavy weight A would go rapidly to the ground, causing the wheels to rotate, the balance to vibrate, and the hands to go round with increasing velocity. In order to prevent this rapid unwinding of the clock-work, and adjust it to the more deliberate measurement of time, the balance is, in De Wyck's clock, loaded with two weights, m, m; and the further these are removed from the axis or spindle, KM, the more heavily they will resist and counteract the escapement of the levers, and the rapidity of the rotation of the escapement-wheel, till the clock was brought to go neither too quick nor too slow.

Fig. 1.—De Wyck's Clock.

The above construction is probably the basis of all the principal time-keeping machines in use in the 16th century. The great epoch in the history of horology is marked by the application to it of the Pendulum (q. v.) as a regulating power. This was effected by Huygens (q. v.) about 1657. This philosopher, in adapting the pendulum to the machinery previously invented, had little more to

do than simply to add a new wheel to the movement, so as to enable him to place the crown-wheel and spindle in a horizontal instead of a perpendicular position, that the lower arm of the balance—then of course perpendicular, instead of horizontal, as in De Wyck's clock—might be extended, as it were, downwards, and thus, in fact, be converted into a pendulum.

The principle of construction adopted by Huygens, from the peculiar action of the levers and spindle, required a light pendulum and great arcs of oscillation; and although, to secure isochronous vibration in these large arcs, the ingenious device of constraining the motion in a cycloidal curve was resorted to, yet the consequence was, as has been remarked, that 'Huygens's clock governed the pendulum, whereas the pendulum ought to govern the clock.' About ten years afterwards, the celebrated Dr Hooke invented an escapement, which enabled a less maintaining power to carry a heavier pendulum. The pendulum, too, making smaller arcs of vibration, was less resisted by the air, and therefore performed its motion with greater regularity. This device is called the *crutch* or *anchor escapement*. It was brought by Hooke before the notice of the Royal Society in 1666; and was practically introduced into the art of clockmaking by Clement, a London clockmaker, in 1680. It is the form still most usually employed in ordinary clocks. It regulates the motion as follows: The pendulum is fixed at A, and hangs down behind the pallet-wheel (the last

Fig. 2.

of the train of wheel-work), which revolves in the direction of BC, under the action of the weight; B and C are the pallets. When the pendulum swings to the left, AC rises, and a tooth escapes from C, while another falls on the outside of B, and, owing to the form of the pallet B, this latter recoils during the remainder of the swing. The same thing occurs on the pendulum's return; the arm AB rises, a tooth escapes from B, and another falls on the inside of C, and is pushed backwards by it during the remainder of the swing. The revolution of D is thus regularly retarded, one tooth being allowed to escape for every two oscillations—i. e., every two seconds—and as the wheel contains 30 teeth, it performs one revolution per minute (the seconds hand is fixed on the extremity of the axle of this wheel). During a portion of each contact between the pallets and teeth, the onward pressure of the wheel gives an additional impetus to the pendulum, so as to counteract the retarding effects of the resistance of the air and friction, which would otherwise bring it to a stand.

The only defect of this escapement is the recoil, and various modifications have been devised to obviate this. The first and most successful was made by George Graham, an English watchmaker in the beginning of the 18th c., and his improved form is called the *dead escapement* or *dead-beat escapement* (fig. 3). Here the outer surface of B and inner of C are arcs of circles, whose centre is A, and a little

Fig. 3.

consideration will shew that there can be no recoil. This escapement is adopted in time-keepers when great accuracy is required. Other inventions, as

the *detached escapement*, the *pin-wheel escapement* in various forms, and the *gravity escapement* (described below), though very efficient, have not come into general use.

In the great clock in the new Houses of Parliament at Westminster, the pendulum is upwards of 13 feet long, to beat 2 seconds, and its bob weighs 6 cwt. The motion is kept up by a *remontoir* or *gravity escapement*. On each side of the pendulum-rod a small metallic hammer is hung upon a peg. The swinging of the pendulum first draws out a little bolt, that stopped the turning of a wheel; the wheel then goes round, under the influence of the weight, lifting one of the little hammers as it does so, until it is caught by another bolt. The hammer-head next falls by its own gravity, and strikes the pendulum-rod just as it is in the act of descending, communicating the force of its blow to quicken the movement; the same thing is afterwards repeated on the opposite side of the vibration, and then again on the same side; so going on alternately. The push thus given is evidently unvarying. The wheel has three stops and cogs on it, and goes once round in three beats of the pendulum, or in six seconds. With this contrivance it is found that all the teeth of the several wheels may be rough, just as turned out from the casting, and the clock will nevertheless keep better time than it would have done with the most perfectly finished teeth under other arrangements.

The gradual perfection of the clock required also improvements in the pendulum. No simple pendulum, however, can be depended on for an accurate timekeeper, for the isochronism of vibration of the pendulum depends on its being always the same length; now a cord contracts or expands with changes in the moisture of the atmosphere, and a rod with cold or heat. To overcome these defects in the pendulum, compensating pendulums were invented, of which Graham's *mercurial compensation pendulum*, invented in 1715, and Harrison's *gridiron pendulum*, in 1726, are the two principal forms (see PENDULUM).

The above improvements in the escapement and the pendulum bring the mechanical perfection of the clock, as a time-keeping instrument, to the point which it has attained at the present day. But the art of horology would be incomplete unless there were some standard, independent of individual mechanical contrivances, to which all may be referred, and by which the errors of each—which must exist in the most perfect human contrivances—may be corrected. The movements of the heavenly bodies are still, as of old, the only standard for a general measurement of time, affording as they do marks of unvarying certainty, to be read by all alike; and clocks and other mechanical contrivances are individual and imperfect measures of the intervals, to be trusted only until there is a new opportunity of comparing them with the certain and public signals of the heavens. These signals can, however, only be accurately read by persons furnished with the proper apparatus, and instructed sufficiently in its use. This is done in observatories, and there are in most parts of this country now sufficient opportunities of setting clocks by a communication more or less direct with these establishments. When these are not to be had, the sun-dial may still be used with advantage, as a means of approximation to the correct time. The time which a clock ought to mark is *mean time*, the definition of which will be found in the article DAX (q. v.). The *mean time* at any place depends on the longitude. Supposing a clock to be set to Greenwich mean time, a clock keeping mean time of any place will be 4 minutes faster for every degree of longitude east of Greenwich,

and 4 minutes slower for every degree west. Since the introduction of railways, clocks are usually set, within Great Britain, to Greenwich mean time.

The methods by which time is determined in observatories belong to the details of practical astronomy. For the more ready transmission of correct time to the public, there is at Greenwich Observatory, as well as some others, a ball which is dropped by means of electricity precisely at one o'clock. Within the last year or two, however (1860—1861), there has been invented a most ingenious device by which public clocks in a town can be kept at every instant in perfect agreement with the mean-time clock in the observatory. This is effected by an electric connection, and a modification of Bain's electric pendulum, invented by Mr R. L. Jones of Chester, on the suggestion of Mr Hartnup, the astronomer of the Liverpool Observatory. For a description, see **ELECTRIC CLOCK**. The first public application of it was to the town-hall clock in Liverpool, when for the first time was seen the curious spectacle of a great clock with works nearly 100 years old keeping time with astronomical accuracy. In the same way, a clock in the castle of Edinburgh, by whose mechanism a gun is fired precisely at one o'clock every day, is controlled by the mean-time clock in the observatory on the Calton Hill. To such perfection has the art of publication, as well as the keeping of correct time, been now brought.

It is not known when the alarm, or when the striking-mechanism of the clock was first applied. The alarm was adopted for the use of the priesthood, to arouse them to their morning devotions. The first striking-clock probably announced the hour by a single blow, as they still do, to avoid noise in churches. In De Wyck's clock, the wheel N, with its projecting pins, served to discharge the striking part (not represented in the figure). During the 17th c., there existed a great taste for striking-clocks, and hence a great variety of them. Several of Tompion's clocks not only struck the quarters on eight bells, but also the hour after

Fig. 4.—Horologe :
Presented by Henry VIII. to Anne Boleyn.

each quarter; at twelve o'clock, 44 blows were struck; and between twelve and one, no less than 113! Many struck the hour twice, like that of St Clement Danes, in the Strand, London, first on a large bell, and then on a small one. Others, again, were invented so as to tell the hours with the least possible noise; also by the aid of two bells, each blow on the small one indicating five hours.

The striking part of a clock is rather a peculiar and intricate piece of mechanism. In ordinary clocks, the impelling power is a weight similar to that which moves the time-measuring mechanism itself; but the pressure of this weight on the striking-machinery is only permitted to come into play

at stated periods in course of the workings of the time-keeping apparatus—viz., at the completion of every hour; when the minute-wheel, which revolves once in an hour, and carries the minute-hand of the clock along with it, brings it into action by the temporary release of a catch or detent, permitting the weight wound up on the cylinder of the striking-apparatus to run down for a little, in doing which, the hammer is forced into action, so as to strike the bell. Whether the strokes shall be one or many, is determined principally by two pieces of mechanism, one called a *snail*, from its form or outline, with twelve steps, and the other a *rack*, with twelve teeth; but the intricate action of the whole it would be in vain here to attempt to explain. Suffice it to say, that the time during which the striking-weight is *allowed* to descend, varies according to the turning of the twelve steps of the snail on its axis, and the position of the twelve teeth of the rack, at different hours of the day; being sometimes only long enough to permit one blow to be given by the hammer on the bell, and at another time long enough for twelve such blows.

The consideration of portable time-keepers (watches and chronometers) is reserved for the head **WATCH**.

HOROSCOPE. See **ASTROLOGY**.

HORS DE COMBAT, a French term, literally meaning 'beyond the battle,' is used to signify a combatant, or body of combatants, so completely beaten either by physical force or strategy, as to be incapable of further action in the struggle actually under consideration.

HORSE (*Equus*), a genus of pachydermatous quadrupeds of the family *Equidæ* (q. v.), or *Solidungula*, generally regarded as including all the species of the family, although sometimes limited (see **Ass**), so as to contain only one species, the most important to man of all animals that are used as beasts of burden and of draught. The principal zoological characters are already given in the articles *EQUIDÆ* and **Ass**, and a more particular description of the *H.* seems to be unnecessary. The native country of the *H.* is uncertain. Some contend for Asia, and some for Africa; some suppose that the *H.* was first domesticated in Egypt, and quote Scripture in support of their opinion, but to no better purpose than to shew that at a very early period it was in use as a domesticated and valued animal among the ancient Egyptians; whilst others adduce arguments not more conclusive to shew that it was originally domesticated in the north-east of Asia; some think it not improbable that Europe also, and even Britain, had indigenous horses. Whether certain wild races of Central Asia and the north of Africa are really indigenous to the regions in which they are found, or the offspring of animals which have escaped from domestication, like those of America; and whether the origin of the domestic *H.* is to be referred to one original form, or to several forms somewhat different, and belonging to different countries, are questions also uncertain; and the last of them is very similar to that which is so much agitated respecting the *Dog* (q. v.), although it must be admitted that the diversities are not so great as in that case.

The lips and teeth of the *H.* adapt it for cropping the short herbage of dry plains or hills, so that it finds abundance where an ox would be very insufficiently supplied. The feet are also adapted to dry rather than to soft or swampy ground. On soft ground, not only is the foot apt to sink not being very broad, but the horny hoof is softened, and a diseased state of the feet is the result, as in the case of many of the great dray-horses of London,

reared in the alluvial districts of the east of England. The H., however, requires a liberal supply of water; and during the dry season, in the hot plains of South America, great troops of wild horses often rush furiously to the rivers, and as they approach the drinking-place, trample one another under foot, vast numbers of skeletons remaining to bleach in the sun.

Wild horses are found on the plains of Central Asia. Some also inhabit mountainous or hilly districts both there and in the north of Africa. They abound still more in the grassy plains of North and South America, although they were first introduced into America by Europeans; and certain tribes of Indians, both in North and South America, have become at least as equestrian in their habits as any of the Tartars of the east. Wild horses are also found in the Falkland Islands, into which they were introduced by Europeans, and a peculiar breed has been found in a wild state in the island of Celebes.

The races or varieties of the H. have an evident relation to the climate of the countries in which they occur. Those of cold and stormy regions are comparatively small and rough-haired; those of more favoured climates, large and sleek. There are also differences, more evidently to be ascribed to domestication, according to which certain breeds are particularly adapted to certain kinds of work, some excelling in fleetness, some in endurance, some in mere strength for burden or draught. The slender form of the race-horse or hunter contrasts almost as strongly with the ponderous solidity of the dray-horse, as the great size of the latter does with the diminutiveness of the Shetland pony.

Wild horses congregate in troops, sometimes small, but sometimes of many hundreds. The males have fierce contests for the supremacy, and males that have contended unsuccessfully are often driven off to a solitary life. On the appearance of danger, the chief stallion of a small troop seems to direct the movements of all, and even the largest troops seem instinctively to move in a kind of concert, so that when they are assailed, the stronger animals oppose the enemy, and protect the younger and weaker. Wolves, even when in packs, attack with success only weakened stragglers, and even the jaguar is repelled. In fighting, horses either raise themselves on their hind-feet, and bring down the fore-feet with great force on the enemy, or wheeling about, kick violently with the hind-feet.

The *Tarpan* of Tartary is one of those races of wild H. which are sometimes regarded as original, and not descended from domesticated animals. It is of a reddish colour, with a black stripe along the back, and black mane and tail. The eye is small and vicious. Tarpans are sometimes caught by the Tartars, but are with great difficulty reduced to subjection. In some of the steppes of Central Asia are wild horses of a white or dappled-gray colour.—The wild horse of South America is there called the *Mustang*. It exhibits considerable diversity of colour, but bay-brown is the most prevalent. It is strong and active, and is often taken with the lasso, and employed in the service of man. A curious method is practised by some Indian tribes of promptly subduing its wild nature, and rendering it tractable, by blowing strongly with the mouth into its nostrils. By other tribes, it is subdued more rudely. It is thrown on the ground, and ere it can recover, a man gets upon its back, whom, when it rises, it cannot shake off, and who retains his seat until it is quite submissive.—The *Koomrah* of North Africa is regarded by Colonel Hamilton Smith as a distinct species (*E. hippagrus*). It has no forelock, but woolly hair on the forehead, is of a reddish bay colour without stripe on the back, or any white

about the limbs, has limbs of a somewhat ass-like shape, and the tail covered with short hair for several inches at the root. It is an inhabitant of mountainous regions.

Of domestic varieties and breeds of the H., the number is very great, almost every country or considerable district having one or more of its own, and particular breeds being valued on account of their fitness for particular purposes. The breeds are also continually varied by crossing, and great improvements have thus been effected. The superior fleetness of the English race-horse and endurance of the hunter are ascribed to the crossing of the old English breed of light-limbed H. with the Arabian; and the English dray-horse, remarkable for its great size and strength, in like manner, owes much of its excellence to the crossing of the largest old English breed of draught-horse with the Flemish. A breed produced by crossing one of the lighter kinds of English draught-horse with the race-horse, is in the highest esteem for carriage-horses. North America has a breed of light-limbed horses, remarkable for fast trotting. The *Suffolk Punch* has been the origin of many of the most useful kinds of draught-horses employed in Britain for ordinary farm-work. The *Clydesdale H.* is also one of the best breeds of this class, and is an improvement on an older breed. Numerous breeds of smaller size, *ponies*, have long existed in different parts of Britain, and in almost all other countries. The *Shetland Pony*, which, compared with the dray-horse, is like a pocket edition of a book beside a great folio, is most prized when most diminutive, and sometimes does not much exceed a large dog in stature. A strong man has been seen to lift one with his arm, and again to ride on its back, whilst at the same time he walked with his feet on each side on the ground. The Shetland pony is, however, a very hardy animal, and remarkably strong.

The Arabian H. has long been the object of untiring care and attention, and to this very much of the excellence of the race is certainly to be ascribed. The regard of the Arab for his horse has long been famous. Very similar in some respects to the Arabian is the Barbary H., which was highly prized in Western Europe before the Arabian was known there, and from the name of which is derived the English word *barb*.

The H. has been used from the most remote ages both for riding and for drawing carriages, but rather for pomp or pleasure, the chase, and war, than for agricultural or other labours, for which oxen and other animals were for a long time more generally employed. The H. is an animal of no little intelligence, docility, and affectionateness; qualities of which the display would certainly be more general and perfect, if it were not for the cruel treatment so commonly practised in 'breaking' and otherwise. The H. has a very strong memory of places, and finds again very readily a road which it has once travelled before. Its caution in advancing on swampy ground has often excited admiration. It seems often to enter with a kind of enthusiasm into the work in which it is engaged: the war-horse evidently delights in the martial music and military movements to which he has been accustomed; the racer and the hunter seem to know the object of their exertions, and to be as keenly bent upon it as their riders; and the draught-horse often exhibits much acquired expertness in situations of considerable difficulty. Instances are also on record of the remarkable display of intelligence in such things as the opening of doors, corn-chests, &c.; and two instances are known of horses which have learned to turn the tap of a water-barrel in order to obtain water, one of which also ended by shutting it again.

A horse has been seen to procure a supply of apples in an orchard by throwing himself forcibly against the trees and shaking them.

The flesh of the H. is used as food in some countries. Its use has recently found advocates in France and some other parts of Europe. It is sold in London as food for dogs and cats. Mares' milk is much used by some of the tribes whose chief wealth consists in their horses: and the Kalmucks subject it to fermentation, and distil from it a kind of spirit. The hide of horses is made into leather, which is used for covering large office and board-room tables, &c. The long hair of the mane and tail is used for making haircloth, stuffing mattresses, &c.

Hybrids between the H. and the ass are noticed in the articles HINNY and MULE. Hybrids have also been produced between the H. and the zebra, and between the H. and the quagga, exhibiting, in some degree, the stripes so characteristic of these species; but they have been turned to no use.

Fossil Horse.—The remains of the horse have been long noticed associated with the mammoth, rhinoceros, and other extinct quadrupeds, in the drift formations and ossiferous caverns in the New World, as well as in the Old. Their occurrence in America is the more remarkable, from that continent being entirely without the horse when it was discovered by Columbus. Cuvier was unable, in the fragments that he examined, to see any difference from the similar portions of the existing species. Meyer and Kaup have pointed out distinctive characters, and Owen has shewn that the remains observed in this country belong probably to two different species. The largest (*Equus fossilis*) was about the height of a middle-sized domestic horse, and differed from this animal in possessing a proportionally larger head and jaws, resembling in this respect the wild horses of Asia described by Pallas, and in having the molar teeth, while equal in length, yet decidedly smaller. The second species (*Equus plicidens*) was about the size of a large ass, and differed from the other species, as well as from the living horse, in the more complex plications of the enamel of its molar teeth.

Horses, of whatever breed or description, should be of good size, shape, and style; for superior animals are fed and kept at the same cost as inferior sorts, are always able to perform their work easily and satisfactorily, and are at any time saleable at remunerative prices. To produce such animals, requires careful selection of sound, active, symmetrical, well-descended parents. The mare carries her colt eleven months, but occasionally exceeds her time by one or two weeks. Farmers prefer their mares to foal in May, from which time the age is generally calculated, but on the turf, ages date from January, and hence the earlier the racing foals are dropped the better. Parturition is usually performed easily and without any assistance, the foal soon getting on his legs, and sucking. Good grass, with a feed of oats daily, will insure an abundant supply of milk. Weaning may take place in five or six months; and the foal, when taken from its mother, must be supplied with a few oats and bran, some good hay, and comfortable shelter at night. At a year old, colts are generally castrated; and are gently broken in and lightly worked when about three years old; but, under good treatment, they continue to grow, and ought not to be put to severe work until they are five.

Oats and hay are the staple articles of food for hard-working horses. The oats should be sound, sweet, and heavy; and for hacks and hunters, are seldom sufficiently dry until they are a year old. Along with good hay, 10 pounds is a fair allowance. To insure thorough mastication and digestion, oats

should be given either slightly bruised, or along with some chaff. For coaching or farm-work, a few beans or pease should be given; half a bushel, along with a bushel of oats and hay, is a usual weekly allowance for well-kept farm-horses. Clover and Rye-grass Hay (q.v.), such as is common throughout Scotland, is more palatable and nutritive than the meadow-hay in general use in England. Riding-horses, eating a fair allowance of oats, will consume daily 14 pounds of hay; but the heavier class of horses require more. Farmers use oat, pea, and bean straw for fodder during the winter months, and in most well-managed establishments, a considerable portion of the fodder is now given cut, which enables the hard-worked horse to fill himself more rapidly, and thus gives him more leisure for rest and repose. Cart-horses usually have an evening allowance of sliced Swedes or carrots; a daily pound of linseed-cake is now frequently added, to keep the coat glossy; whilst a weekly bran-mash is advisable, and should contain during winter an ounce of pounded nitre. Horses should be liberally supplied with water at least three times daily, nor is it ever necessary to restrict the supplies, except for a few hours before severe fast work, and when the animal is much overheated and fatigued. In some well-constructed boxes and stables (see STABLE), there is water constantly before the animal in a shallow vessel capable of holding about a quart, and which, as it is removed, is slowly replenished, and thus cannot be drunk either with undue rapidity or in injurious quantity. During summer, horses generally have such green food as grass, clover, or vetches; but if their work is severe or long continued, oats and hay ought still to form the principal articles of diet. In summer, farm-horses are often turned out to graze after their day's work is over; but it is generally more economical to bring their green food to the stable, or, better still, to commodious yards. It is seldom advisable to follow the old-fashioned plan of turning hacks or hunters out to grass, as they are apt to get kicked or otherwise injured, and lose besides their condition. If not required during the summer months, they are better and safer in a large yard or a commodious box, where they can have proper feeding and daily exercise. They will thus, at little extra expense, be kept in good condition, and fit for work, their legs free from blemishes, and their constitutions uninjured by violent diversities of feeding and management. The small stomach and natural habits of the horse indicate the necessity of his being fed at frequent moderate intervals of five or six hours. In most localities, farm-horses turn out at seven, returning to the stable at 11.30 or 12, being fed and rested for an hour and a half or two hours, and then returning to work for four or five hours. In the midland and southern counties of England, the straggling position of the fields, and their inconvenient distance from the stables, induce many farmers to keep their horses in the yoke from seven until two or three, when they finish for the day. This practice is, however, by no means commendable, unless the work is very light, and the horses have a feed, a few mouthfuls of water, and 10 or 15 minutes' rest about mid-day.

To insure health, horses must be kept in commodious, well-lighted, airy, properly-ventilated stables, which ought to be erected only in dry situations, should be thoroughly underdrained, and well paved, if possible without a loft overhead, white-washed annually, and always kept scrupulously clean and free from smell. This may be effected by the prompt removal of soiled or wet litter, and by strewing the floors daily with a little gypsum, or M'Dougal's disinfectant powder. Where there is

room, loose boxes are preferable to stalls, especially for the lighter sort of horses, that spend much of their time indoors. With proper feeding, exercise, and grooming, with plenty of fresh air, and good stable management, horses are scarcely ever out of health, and require neither balls, cordials, nor any such messes. Without professional advice, no groom or carter should, under any pretence, be permitted to indulge his predilection for physicking or doctoring healthy horses.

HORSE, a miner's term, applied to any intruded material which is the apparent cause of a sudden interruption in the continuity of a mineral that is being quarried. With vein-miners, a detached mass of rock or spar which fills the vein receives this name, while colliers apply the term to the shale which occupies a natural but sudden thinning out of the coal-bed, as well as to such interruptions as seem to have been the channels of small streams, and which were subsequently filled up by the clay that formed the roof of the coal.

HORSE-CHE'SNUT (*Æsculus*), a genus of trees of the natural order *Sapindaceæ*, having large opposite digitate leaves, flowers with five spreading unequal petals, and a leathery 3-valved capsule covered with soft spines. The seeds, which are not more than three in each fruit, are large, and somewhat resemble chesnuts; but the habit of the trees, their leaves, and their flowers, are very unlike those of chesnuts, with which they have no botanical affinity.—The **COMMON H.** (*Æ. hippocastanum*) is a much esteemed ornamental tree, very frequently

Horse-Chesnut, Leaves, Flowers, and Fruit
(*Æsculus hippocastanum*).

planted in Britain, and in all parts of Europe of which the climate is suitable, on account of its rich foliage, and its erect racemes of beautiful reddish white flowers, which are produced at the extremities of the branches, and contrast admirably with the dark green of the leaves. At St Petersburg, the H. is a greenhouse tree. It is supposed to be a native of Persia or some part of the East; but, strangely enough, its native country is still somewhat uncertain. It was introduced into Western Europe, from Constantinople, in the end of the 16th century. It attains a great size, sometimes rising to the height of 100 feet, and extending its branches very widely, whilst they often droop almost to the ground. The leaves have long stalks, and seven obovate-wedge-shaped leaflets. The wood is soft, not very strong, nor very durable in the open air; but

is used for many ordinary purposes, and by carvers, turners, &c. The bark is bitter and astringent, containing a bitter principle called *Æsculine*; it has been used in tanning and dyeing; that taken from branches not very old has been extensively used on the continent of Europe as a substitute for Peruvian Bark. The rind of the seeds contains a colouring matter, which has been used in dyeing; the husks also have been used in dyeing. The seeds are unpleasantly bitter, and contain so much of the saponaceous substance prevalent in this natural order, that when reduced to powder, they may be used for washing. They contain, however, a large quantity of starch, which, when extracted and freed from bitterness by means of an alkaline solution, is pleasant and nutritious. It is prepared on a large scale and at a cheap rate in France. Horse-chesnuts have long been employed in various countries as food for oxen, sheep, swine, and horses, all of which are fond of them, and grow fat upon them. In Britain, however, they are still very generally allowed to rot beneath the trees. It is said that when the H. was first introduced into Britain, it did not perfectly ripen its seed, which it now does even in the northern parts of the island.—The other species of *Æsculus* are natives of North America. The foliage is very similar to that of the common horse-chesnut. Both the leaves and fruit, however, of the **BUCK-EYE** or **AMERICAN H.** (*Æ. Ohioensis*) are very poisonous.—North America possesses also a number of species of a nearly allied genus, *Pavia*, with very similar foliage, smaller flowers, and smooth fruit. The seeds of *P. macrostachya* or *P. edulis*, the **EDIBLE BUCK-EYE**, are eaten, either boiled or roasted. This species is a shrub with long and beautiful racemes of fragrant white flowers, which have long projecting stamens. It is a native of the southern states, and seldom ripens its fruit in England. *P. Indica* is a lofty tree, growing at elevations of 8000—10,000 feet in the Himalaya, and producing seeds very similar to those of the H., which, although bitter, are eaten in times of scarcity.

HORSE-FLY. See **FOREST-FLY.**

HORSE-GUARDS, the name applied to a large public office in Whitehall, appropriated to the departments under the general-commanding-in-chief. The word Horse-guards is used conventionally to signify the military authorities at the head of army affairs, in contradistinction to the civil chief, the Secretary of State for War.

HORSE-GUARDS, ROYAL, or OXFORD BLUES, is the third heavy cavalry regiment of the Household Brigade. The regiment was raised in 1661 from the remnants of the disbanded army of the late Commonwealth. It has ever proved a loyal corps, although it readily transferred its allegiance from James II. to William III. It took part in Marlborough's campaigns; served under the Duke of Wellington in the Peninsula and at Waterloo, and has always been considered one of the finest heavy cavalry corps in the world. The guards of state for the sovereign are taken either from its ranks or from those of the Life-Guards. The present uniform consists of a steel helmet, with plume, a steel cuirass over a blue coat, leather breeches, and knee-boots; the horses are black. The establishment of the regiment consists (1872) of 1302 of all ranks, with 825 horses, exclusive of officers' chargers.

HORSEMANSHIP. Throughout history the art of managing the horse and riding on his back has ranked high among useful and graceful accomplishments. According to Cæsar and Livy, the Numidians and Mauritians rode their horses without either bit or saddle, and guided them

solely by using a small switch, which was applied to either side of the neck, according as they wished to turn. The Persians trained their horses to kneel to receive their riders, and were the first to introduce saddles. Saddles of a similar shape to those now in use were not known till the 14th c., and side-saddles were introduced about 1388. Stirrups were used in the 5th c., but were not common even in the 12th.

The two essentials for riding are a firm seat and a light hand, as without a combination of the two no one can become a good horseman. In every description of riding, the light delicate 'hand,' just feeling the mouth of the horse, and playing the bit in accordance with his movement, will insure success; and it is to this delicacy of wrist that we must attribute the ease and skill with which ladies often ride the most high-spirited animals, which, in rougher hands, would be unmanageable.

The first lesson in horsemanship is to learn to mount safely and easily; and the ordinary, and on the whole least objectionable way, is as follows: Stand at the shoulder of the horse, looking towards his tail, and taking the reins in the right hand, divide them by the middle-finger of the left till you feel the horse's mouth; then take hold with the left hand of a lock of the mane, lift the left foot into the stirrup, and using the mane as a slight hold, spring into the air, taking hold of the back of the saddle to assist in getting the right leg easily over the horse, steadying the fall of the body by the right hand on the pommel, and then arranging the stirrups. In dismounting, exactly the reverse of this process is followed, or both feet may be disengaged from the stirrups at once, and the rider may vault from the saddle to the ground with greater rapidity, and less risk of falling if the horse chance to move on.

There are four different styles of riding practised among modern civilised nations—viz., the military, road, hunting, and racing styles. The military style differs in many particulars from the others, as, owing to the long stirrups used, the soldier is obliged to sit well down in his saddle, with his body erect, the seat being preserved more by balance than by a tight hold by the leg or thigh.

In the seat for road-riding, the stirrups are arranged at such a length that when the feet are hanging loose, they shall just touch the ankle-bone, and the rider usually inserts the feet only as far as the 'ball' of the foot. In riding, have the horse well in hand, to assist in supporting him, in case of stumbling; the seat firm, to be secure in case of shying; and a knowledge of handling the bridle, to insure a quick and ready response. In hunting, a much firmer seat is necessary; the stirrup-leathers are about two holes shorter, the feet pressed 'home' in the stirrups, which otherwise would be apt to be lost in jumping; the leg from thigh to the knee well forward, and nearly at right angles to the upper part of the body as inclined forward; the legs perpendicular, the heel well down, and the toe pointing nearly straightforward. This 'seat' the hunter has in common with all equestrian nations, as the Arabs, Tartars, Persians, Egyptians, Cossacks, Magyars, and Circassians, the last-mentioned nation carrying it to such an extreme that the leg assumes the form of the letter V, with the knee for the apex. In riding at a fence, 'collect' the horse into the pace at which he goes with most ease to himself; keep him straight at the fence till he rises; 'ease' his mouth by leaning forward; take especial care not to confine it when he is making his effort, or you will pull him into the fence as he descends; lean well back in the saddle, and gently take hold of his mouth to support him on landing.

Do not gallop with a loose rein (excepting downhill, when the horse requires his head free), for the horse will go with a straggling pace, which is very undesirable. For racing, the essentials are a good and powerful seat, good 'hands,' a great knowledge of pace, and quickness to take advantage of any chances of success. The jockey's seat is peculiar, as his object is to give as much ease as possible to his horse. He rides very much forward, frequently standing in the stirrups, and regulating his pull at his horse according to his orders.

As the strongest part of a horse, and also the centre of action, is situated at a point just behind his shoulder-blades, the nearer we can ride to this the better, and riding rather forward in the saddle is a relief to the horse, while leaning back, as it bears upon his loins—his weakest part—is a cause of fatigue. The grip in riding should be obtained by the knee, the thighs and the calves slightly. The thigh is the most essential part of a good and strong seat. Few riders whose thighs are short and round, have a good seat; while, on the other hand, jockeys and tall thin men, whose thighs are long, and more or less hollowed on the underside, are generally very firm.

No one can pretend to horsemanship without a knowledge of the proper action for emergencies. If a horse runs away, do not exhaust yourself by vain pulling, but guide him out of danger, and let him run till he is tired. A Bucephalus noseband is a great security against bolting. If a horse rears, loosen the reins, and lean forward; in hunting, the 'art of falling' consists in getting clear of your horse. In case of a horse kicking, keep his head up as much as possible, and sit firm in the saddle.

HORSE-POWER, a term used in expressing the force of a motive power. It is based upon the assumption that horses in general perform a certain constant amount of work in a specified time; an assumption which is evidently erroneous. The fundamental unit of work is the Foot-pound (q. v.); but in measuring the work of a horse by this unit, the estimates of the most celebrated engineers differ widely from each other: Boulton and Watt, basing their calculations upon the work of London dray-horses (working eight hours a day), estimated it at 33,000 foot-pounds per minute. D'Aubuisson, taking the work done by horses in whips at Freiberg, estimated the work at 16,440 foot-pounds, working eight hours a day; under similar circumstances, Desaguliers's estimate was 44,000; Smeaton's, 22,000; and Tredgold's, 27,500 foot-pounds; 17,400 is thought to be near the truth. It matters little, however, what number is assumed, provided the same be always used; and accordingly the original estimate of Watt is still counted a horse-power. In calculating the power of a steam-engine in terms of this unit, the general rule is to 'multiply together the pressure in pounds on a square inch of the piston, the area of the piston in inches, the length of the stroke in feet, and the number of strokes per minute, the result divided by 33,000, will give the horse-power;' but it is necessary to deduct about $\frac{1}{10}$ th of the whole, as an allowance for friction.

HORSE-RACING dates from the times of the early Greeks and Romans, among whom it was a favourite sport. In England, Charles I., Cromwell, and Charles II., were more or less patrons of the turf; and the last-named monarch was a regular frequenter of Newmarket, which, partly from this reason, became the metropolis of racing. William III. and Queen Anne were also patrons of horse-racing. Flying Childers, bred in 1715 by the Duke of Devonshire, was long considered to have been

the fleetest horse ever known; he carried nine stone at Newmarket, and ran $3\frac{1}{2}$ miles in 6 minutes 40 seconds; he was never beaten, and produced 497 winners, besides realising £200,000 in stakes. The celebrated horse Eclipse, the fleetest from the time of Childers, was bred in 1764 by the Duke of Cumberland. Commencing at five years old, this horse won eleven plates, was never beaten, and became the sire of innumerable winners. The modern race-horse is considerably taller and of earlier maturity than the original type, partly from judicious crossing, and also from early high-feeding and training; yet there has been a loss of stoutness of constitution, although, for speed, no pure bred Arab has a chance with a modern thorough-bred. The horses are entered as yearlings (a race-horse's age dates from the 1st of January in the year he is foaled); but of 240 entered in this way, rarely more than 25 come to the post two years afterwards, the majority being found practically useless for racing purposes, and the forfeits from these horses thus 'scratched' form by far the greater portion of the splendid prizes of the turf. (It has been calculated that there are 1500 thorough-bred brood-mares in England; that these produce annually about 1100 foals.) The value of a thorough-bred yearling depends entirely upon 'the fashion' of his blood: as much as 1800 guineas have been given, and 600 and 800 are by no means extravagant rates for promising colts. The training of the young racer commences in his second year, when he is placed under a trainer, in an establishment such as those at Newmarket, Middleham, Richmond, Malton, Ilkley, Epsom, &c., where the downs offer a wide expanse of open country for exercise. The trainer's charge is two guineas a week; and for this, each horse is personally attended to and ridden by a lad specially attached to him. A thorough preparation for a great race is a long and troublesome operation, consisting of several stages, during which the colt is gradually brought from a naturally loose condition to the greatest perfection possible: first, by steady and continuous walking exercise, then proceeding by gradual stages to gentle galloping and sweating, and finishing by testing the capacity of the colt against a competitor at a distance equal to the forthcoming race. It has been found that, practically, the speed of almost all horses can be equalised by addition or subtraction of weight; and so nicely is this capable of being adjusted, that the handicaps, which are arranged on this principle, provide some of the best races in the year. The Chester Cup, Doncaster Cup, Ascot Cup, Goodwood Cup, Liverpool Cup, Cezarewitch and Cambridgeshire stakes, are all run on these terms. For the great prizes of the turf, however, the 1000 and 2000 guineas, the Derby (about £6000), Oaks (about £4000), and St Leger (about £5000), for three-year-olds, the horses run upon an equality of age and weight.

Enormously large as are the stakes run for—upwards of £200,000 annually—this is as nothing to the money which annually changes hands in betting. We may divide betting-men into two classes—those who back a single horse from judgment, or private information; and those who, without any knowledge, but from mere calculation, estimate the odds, and take the 'field' against 'any favourite.' The latter class are the professional betting-men ('the ring'), who devote themselves to the pursuit; the former is composed of the owners of horses and their friends, who trust to their knowledge and tact. Colossal fortunes have been made by the 'ring' in this way, and there are men perpetually attending the country races, and ready to accommodate any gentleman by 'backing' the field. As no debts incurred by betting are recoverable by law, they

become debts of honour; and any 'defaulter' is only amenable to the regulations of the turf, which have been devised to insure, as far as possible, honest dealings. The Jockey Club is the great tribunal of sport in England, and its regulations are adhered to all over the country: it is composed of 64 noblemen and gentlemen, who take an interest in the turf. Newmarket Heath, the great centre of racing, is in its possession, and by virtue of the position and authority of its members, it is enabled to exercise a great check upon dishonesty and fraud. The seven annual race-meetings at Newmarket are as follows: the Craven, first spring, second spring, July, first October, second October, and the 'Houghton.' The principal races are for the 1000 guineas, 2000 guineas, Cezarewitch, and Cambridgeshire. The Epsom meeting is the most popular, from its nearness to London, and from the interest attaching to the races for the Derby and Oaks. After Epsom, the Doncaster St Leger, for three-year-olds, claims the position of greatest interest; it is run for by the competitors in the previous Derby and Oaks, and is generally considered to be a test of the correctness of their results. Ascot is reckoned the most fashionable meeting in the year; it is held on Ascot Heath, in Berks, and here the best horses in England compete, at a more mature age than at other races. In the race for the Ascot cup in 1854, West Australian ran the $2\frac{1}{2}$ miles in 4 minutes 27 seconds, the fastest race on record. Goodwood meeting, which is held in the Duke of Richmond's park, in Sussex, is also popular. There are upwards of 150 race-meetings held annually in the United Kingdom; upwards of 1600 horses run at these, and 160 jockeys are in constant employment. A good jockey is considered so valuable, that he is always retained by one or more masters, for a considerable sum, and these gentlemen have a call upon his services in a certain rotation. The regular pay of a jockey is £5 for a winning and £3 for a losing 'mount'; but there are so many gratuities, that this gives no indication of the income of a jockey, which is often very large: £1000 has frequently been given by a grateful owner. Racing has become popular in France, Russia, Austria, Prussia, Sardinia, and in the British colonies of India, Australia, the Cape, and Canada.

In addition to the flat-racing in England, there are a great number of steeple-chases, where horses contend over natural and artificial fences, ditches, &c. The sport is dangerous, on account of the immense speed arising from competition, so that horses get too distressed to jump, and broken backs and ribs are the consequence. In America, trotting-matches are very popular, and their horses excel all others in that description of racing.

HORSE-RADISH (*Armoracia*), a genus of plants of the natural order *Cruciferae*, differing from scurvy-grass (*Cochlearia*) chiefly in having the valves of the seed-pouches destitute of prominent nerves. The species are perennial herbaceous plants, having erect stems and white flowers, and roots remarkable for their pungency, which is owing to a volatile oil, of very powerful odour, believed to be identical with the volatile oil of mustard. The COMMON H. (*A. rusticana*) has long cylindrical white roots, stems about two feet high, large, much-veined, oblong, crenate root-leaves on long stalks, and elongate-lanceolate stem-leaves. It grows in damp meadows in the middle and south of Europe, is naturalised in some places in Britain, and is cultivated for the sake of its roots, which are scraped or grated down and mixed in salads, or used as a condiment with roast-beef. H. root is used also in medicine as a stimulant, and is often useful

in promoting digestion; it is also regarded as an antiscorbutic; and it is sometimes applied externally as a rubefacient instead of mustard. In cultivation, the H. is generally planted very deep. It is very difficult to eradicate from ground in which it has become established, as almost any portion of the root will grow.—Another species, *A. macrocarpa*, a native of Hungary and Transylvania, has much larger flowers, and a rather less pungent root.

HORSE-RADISH TREE (*Moringa pterygo-sperma*), a tree of the natural order *Moringaceæ*, a native of India and Arabia. It has bipinnate or tripinnate leaves, with roundish oblong leaflets, terminal panicles of white flowers, and a pod-like, 3-valved fruit, with roundish 3-winged seeds. The leaves, which are mildly pungent, are used in curries, and with vinegar: the roots, which are very pungent, are used for purposes like those for which the root of the horse-radish is used, from which they are not easily to be distinguished. The seeds yield the useful fixed oil called *Oil of Ben* (q. v.), and the bark a gum like tragacanth. *M. aptera*, another species of the same genus, also a native of the East Indies, is cultivated in Egypt, Syria, and Italy, for the sake of the oil of ben obtained from its seeds. For the sake both of the pungent roots and of the oil, these trees are now cultivated also in the West Indies.

HORSE-SHOEING. The ordinary system of horse-shoeing is rude and irrational, and is the main cause of most lamenesses and of the majority of falls in riding and driving. Chief amongst its faults are the attempts to fit the foot to the shoe, instead of the shoe to the foot, and the wholesale cutting and rasping, and consequent injury of the several parts of the foot. After the cautious removal of the old shoe, the crust on which it rested generally requires to be pared down with a drawing-knife, and its edge afterwards rounded with the rasp. Any ragged portions of the frog may also be taken off, and this includes the whole of the allowable paring or dressing of the horse's foot. The horny sole intended as a covering and protection of the sensitive parts beneath; the tough elastic frog, an insensible pad which obviates concussion, and preserves the foot wide and free from contraction; the bars, an involution of the crust, which help it to support weight, and give it lateral support, are all too valuable to be ruthlessly cut away, and in all ordinary cases must be scrupulously preserved from both knife and rasp. For sound healthy feet treated as advised, a plain shoe is preferable for saddle or harness horses; the web need not exceed three-fourths of an inch, must fit the crust closely and accurately all the way round to the heels, where its inner edge will rest upon the strong and uncut bars. Nowhere must there be any overlapping, which only renders the shoe more apt to cut the opposite limb, and be torn off in heavy ground. To lessen the chances of tripping, and make the shoe wear equally, it should for the fore-feet be turned up slightly, and its ground surface hollowed out a little at the toe, so as to present the appearance of an ordinary shoe which has been worn for a fortnight or three weeks; and which, as every one knows, is therefore rendered more safe and comfortable. By turning up at the toe, these advantages are secured at once. For saddle or light harness work three nails on the out, and two on the inside, will firmly secure any well-made, well-fitting shoe. The nail-holes should be countersunk, be nearly in the centre of the web, and pass straight through it, thus giving the nails a firmer hold of the stout unrasped crust. The points of the nails when driven home should be broken over and laid down with the hammer, but not

touched with the rasp. The rasping of the crust, which smiths fondly regard as their finishing and polishing stroke, is very injurious, removes the unctuous protecting portion of the crust, and renders it weak, brittle, and liable to crack. Shoes should be replaced every three weeks, or a month at furthest. In shoeing the hind-feet the outside web is generally turned slightly down behind, whilst to give an equal bearing the inside heel is thickened. For heavy draught, both hind and fore shoes should have moderate tips and heels, which enable the horse to exert his full powers without so much risk of slipping. Instead of the five nails used for the lighter horses, seven or eight are requisite.

Horses with weak, tender, or bruised soles may for a time require leather or waterproof pads, but as the sole grows, these should be discontinued, and are never required in healthy feet, where the sole, which is the best and most natural protection, is allowed to grow undisturbed by the knife. Horses with corns should have their shoes made with a wide inside web, which rests upon the bars, or have for a time a bar-shoe. The last nail on the inside should also be dispensed with, and the seat of the corn or bruise carefully pared out, but without injuring either the frog or bars. If, from constant cutting, the bars are unfit to aid the crust in carrying the shoe, it will be often advisable to shoe for a time with tips or half-shoes, keeping the horse as

A sound Fore-foot prepared for the Shoe.

Copied from Stonehenge's *Horse in the Stable and the Field*.

A, A, the heels of the crust; B, the toe cut out to receive the clip; C, C, the quarters of the crust; D, D, the bars as they should be left, with the full frog between them; E, E, the angles between the heels and bars, where corns appear; F, F, the concave surface of the toe; G, G, the bulbous heels; H, the cleft.

much as possible on soft ground, and waiting the healthy growth of the foot. In troublesome cases of thrush, such tips are also most serviceable, allowing the frog the natural healthy pressure for which it is intended, and with astringents and cleanliness, greatly expediting a cure. Groggy horses should have the toe shortened, and turned up, as already advised; the frog and sole must be untouched, and the shoes made light and nicely fitted. Over-reach, or cutting of the heel of the fore-foot with the shoe of the hind, is remedied by filing round the posterior edge of the offending toe, and keeping that shoe as far back as possible on the foot. For speedy cut, which is common in horses with in-turned knees, the shoe should be carefully fitted, and no projecting portions left; the clinches must

also be well hammered down.—Further information may be found in Lieutenant-colonel Fitzwygram's *Notes on Shoeing Horses*; Mr Miles's pamphlet on *Horse-shoeing*, originally published in the Journal of the Royal Agricultural Society; Professor Dick's Manual; and other veterinary treatises.

HORSENS, a small but very old town and seaport on the east coast of Denmark, and one of the prettiest and most thriving in the country, is situated at the head of the fiord of the same name, 25 miles south-west of Aarhus. It contains two churches, has four bridges, and carries on manufactures of tobacco, and a considerable general trade. Pop. 7250.

HORSHAM, a parliamentary borough and market-town of England, in the county of Sussex, is situated on a tributary of the Arun, 28 miles north-east of Chichester, and 35 miles south-south-west of London. The Court-house, a Gothic edifice; St Mary's Church, in the Early English style; and the Grammar-school, with an endowment of £412 a year, are the principal institutions of the town. The trade and manufactures are considerable. H. returns a member to parliament. Pop. of parl. borough in 1861, 6747. (1871—7831.)

HORSLEY, SAMUEL, an English prelate, was the son of a clergyman of the Episcopal Church, and was born at St Martin's-in-the-Fields, London, in 1733. He was educated at Westminster School and Trinity Hall, Cambridge, where, though he studied hard, and laid in immense stores of knowledge, he took no degree in arts. In 1758, he became curate to his father, then rector of Newington, and shortly after succeeded to the rectory, a living which he held for thirty-four years, though he also enjoyed in the interval many other preferments. In 1767, H. was elected a Fellow of the Royal Society, of which he long continued an active member. In fact, the writings that first brought him into notice were scientific, and not theological. We may mention his *Remarks on the Observations made in the late Voyage towards the North Pole, for determining the Acceleration of the Pendulum, in lat. 79° 51' (1774)*. Two years afterwards, he issued proposals for a complete edition of the works of Sir Isaac Newton, which, however, did not make its appearance till 1785. But the grand event in his career was his controversy with Dr Priestley, which, considering the momentous nature of the subjects discussed, and the splendid talents of the combatants, may be safely pronounced to be the greatest theological contest of the 18th century. The impression at the time was, that so far as hard, merciless hitting goes, H. had decidedly the best of it. Rude in language, but panoplied in learning, contemptuous, defiant, dictatorial, his attitude reminds one of Goliath rather than of St Paul, and we cannot but feel that he is, at least, as much inspired by the ambition of the pugilist as by the ardour of the Christian. The work that excited the controversy was Dr Priestley's *History of the Corruptions of Christianity*, among which corruptions was included the orthodox doctrine of Christ's uncreated divinity. H. reviewed the work with great severity in his charge delivered to the clergy of the archdeaconry of St Albans, May 22, 1783. Priestley replied the same year in a publication entitled *Letters to Dr Horsley in Answer to his Animadversions, &c.* In 1784, H. retorted in seventeen *Letters from the Archdeacon of St Albans in reply to Dr Priestley, &c.* These were, in return, met by a new series from Priestley, who, waxing warm with the fight, describes his antagonist as 'the incorrigible dignitary.' After a silence of eighteen months, H. again replied in his *Remarks on Dr Priestley's Second Letters, &c.*

and in 1789 collected and published the whole that he had written on the subject. His services were rewarded with the bishopric of St Davids in 1788, whence he was translated to the bishopric of St Asaph's in 1802. He died October 4, 1806. H.'s character as a writer has been already indicated; it remains to be added, that as a bishop he was liberal and humane both to the clergy and the poor of his diocese, although vigilant and even strict in the discharge of his episcopal duties. H.'s works, besides those already mentioned, consist of sermons and treatises on biblical criticism, on mathematics, and on classical subjects. A collected edition of his theological works was published by Longman (6 vols. 1845).

HORTICULTURAL SOCIETIES, associations for the encouragement of gardening, are now numerous in almost all civilised countries, but seem to derive their origin only from the beginning of the present century, when the *London Horticultural Society* was formed, chiefly through the exertions of Mr Knight, Mr Wedgwood, and Sir Joseph Banks. The society obtained a charter in 1808. The *Experimental Garden* of the society, the first of its kind, was established in 1817, and was removed to its present situation at Chiswick in 1822. The progress of the society was very rapid; and its usefulness has been very great. Societies of the same kind soon began to spring up in Germany and other parts of the continent of Europe, and horticultural societies now exist in almost all the towns and in many of the villages and rural districts of Britain. The *Prussian Gardening Society* perhaps ranks next in importance to the horticultural society of London; and the *Pomological Society of Allendorf* has been very useful in regard to the cultivation of fruits. The horticultural societies, now so common throughout Britain, have done much to promote not only horticulture, but habits of neatness and a taste for flowers among the humbler classes, of which the humanising effects have been very manifest and important. It is perhaps to be regretted that their attention has been so exclusively devoted to the cultivation of particular kinds of vegetables already in general use, and of those flowers known as florists' flowers.

HORTICULTURE. See GARDENING.

HORUS, an Egyptian deity, whose name, *Har*, means 'the day,' or 'the sun's path,' and is generally written in hieroglyphics by the sparrow-hawk, which was sacred to him. The old derivation from the Hebrew *aur*, light, is now recognised as incorrect. Under the name of Horus were included several deities, as Haroeris, the Elder Horus (q. v.), and Harpocrates (q. v.), or the Younger Horus; *Har-sam-ta*, Horus, the uniter of the upper and lower world, who was the second son of Athor, resided in Annu, or Heliopolis, and emanated from the eye of the sun (Rosellini, *M. d. c.*, t. 47); and *Har-net-ta*, another form of the same god, represented as a boy wearing a triple crown, who existed from the commencement of things, a self-created being, and emanated from the Nu, or firmament; besides several others. But the principal Horus was H. the son of Isis (*Har-si-hesi*), represented as a naked child standing wearing a skullcap, or the crown of Upper and Lower Egypt. H. is first mentioned by Herodotus (ii. 144, n. 156) as the son of Isis and Osiris, and brother of Bubastis, the Egyptian Diana. Various accounts are given of his birth; he having been, according to one version, engendered of his father Osiris before the birth of Osiris and Isis; or, according to another account, begotten of Osiris after that god's destruction by Typhon. His birth was said to be premature, and he was

consequently weak in his lower limbs. In order to avoid the persecution of Typhon, he was brought up by Leto on the floating island of Chemmis, or Buto, in secret. Having grown up, he became *Har-net-alf* (Horus the avenger of his father), and, along with Isis, avenged his father's death (see OSIRIS), according to the best received tradition, vanquishing Typhon and his associates in a great battle at a village near the city of Antaeus, on the 26th of the month Thoth, on which occasion Osiris came from the nether world to his assistance in the shape of a wolf (Diodor. i. 21). According to the Egyptian ritual, he cut off their heads for the fowls of heaven, and their thighs for the wild beasts and fishes. Typhon is said to have been delivered bound in fetters to Isis, who released him, upon which H. tore the diadem off his mother's head, but Thoth replaced it by the head of a cow. H. was often confounded with the elder Horus by the Greeks, but the monuments represent him as the type of royalty, the antagonist of Set or Typhon, the avenger of his father Osiris, for whom he obtained the corn of Elysium and the waters of Elephantine, conquered the north and south, and shared Egypt with Set or Typhon, having held the government of the northern portion as Typhon of the south. After the death of Typhon, he became sole monarch, and as last king of the dynasty of gods, reigned, according to different versions, 100 or 25 years. Numerous esoteric explanations have been given of this god, as that he represents the Nile, as Typhon the desert, the fruitful air or dew which revives the earth, the moon, the sun in relation to the changes of the year, or the god who presided over the course of the sun. He also represented three planets, Jupiter (*Harapshita*), Saturn (*Harka*), and Mars (*Harteshr*). The sparrow-hawk was sacred to him; so were lions, which were placed at the side of his throne. There was a festival to celebrate his eyes on the 30th Epiphi, when the sun and moon, which they represented, were on the same right line with the earth. A movable feast, that of his coronation, is supposed to have been selected for the coronations of the kings of Egypt, who are described as sitting upon his throne. When adult, he is generally represented hawk-headed; as a child, he is seen carried in his mother's arms, wearing the pschent or atf, and seated on a lotus-flower with his finger on his lips. He had an especial local worship at Edfou or Hut, the ancient Apollinopolis Magna, where he was identified with Ra, or the sun. There were also Books of Horus and Isis, probably referring to his legend (Lucian, *De Somn. sive Gall.* s. 183). The magnet was called his bone; he was of fair complexion.—Birch, *Gall. of Antiq.* p. 35; Wilkinson, *Mann. and Cust.* vol. iv. p. 395; Tablonski, *Panth.* ii. 4, p. 222; Champollion, *Panth. Eg.*; Hincks, *Dubl. Uni. Mag.* xxviii. p. 187; Boeckh, *Manetho*, p. 61.

HORUS, a king of Egypt, named Haremhebi, who reigned at the close of the 18th dynasty. His reign has been placed at 1661, 1455, or 1446 B.C., but it probably fell about 1400 B.C. Although the lists of Manetho give him a reign of 36 or 38 years, no higher monumental date than his seventh year has been hitherto found. He restored the worship of Amen Ra, which had been overthrown by the disk or sun worshippers, and conquered the Barubaru, a tribe of the negroes of Kush or Æthiopia. The most southern point where his monuments have been found is Gebel-Addeh, the ancient Amen-Heri, between the Wady Halfa and Ibsamboul. He also embellished Luxor and other quarters of Thebes. Fine statues of this monarch exist at Turin, and others in the British Museum.—Brugsch, *Geographie des Alten Ægyptens*; Champollion-Figeac, *L'Égypte*, p. 319.

HORVÁT, ISTVÁN (Stephen), the Hungarian Varro, was born at Stuhlweissenburg, in 1784. From early youth to his death in 1846, H. consecrated all his rare abilities to historical research, with the double object of settling the question as to the origin of the Magyars, and of consolidating Hungarian nationality through the scientific development of the Hungarian language. Among H.'s published works, the chief merit belongs to his *Magyarország Tösgyökere Régi Nevezetseiről* (Primitive Families of the Hungarians, Pesth, 1820), an 8vo volume of moderate size, but the materials for it have been gathered from innumerable rare manuscripts, and other documents, partly foreign, partly domestic. It is a monumental work in genealogy, connecting some of the living Hungarian families with the chieftains who came with Árpád at the end of the 8th century. In 1814, appeared at Pesth, *Defence of the Kings Lewis the Great and Mathias Corvinus*; in 1821, two volumes of *Answers to the Questions on Philology, put by the National Museum at Pesth*; in 1825, *Sketches from the Oldest History of the Hungarian Nation*; in 1828 and 1829, *Researches on Biblical Expressions, &c.* H. was for many years editor of, and later, chief contributor to the *Tudom Ányr Gyűj temény*, or Scientific Magazine.

HOSE'A, the third (in the order of time) of the twelve minor prophets of the Old Testament, delivered his prophetic message, according to the inscription of his book, during the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah, and of Jeroboam II., king of Israel. Reckoning even from the last year of Jeroboam's reign (about 785 B.C.) merely to the first of Hezekiah's (about 725 B.C.), his career must thus have extended over nearly 60 years; but most—especially of modern scholars—seem inclined to regard this period as improbably long, though some calculations (e.g., Horsley's) make it even longer. Whether H. belonged to Judah or Israel, cannot be determined with certainty; but the greatest critics, with the exception of Maurer, maintain him to have been an Israelite. His prophecies, which are mainly directed against Israel, give a faithful picture of shameless idolatry, licentiousness, intemperance, falsehood, and eager inclination towards disadvantageous and demoralising foreign alliances, and they may be regarded as appropriate to the period of anarchy and vice which followed the luxurious reign of Jeroboam II.

HOSHUNGABA'D, a town in Central India, stands on the left or south bank of the Nerbudda, in lat. 22° 44' N., and long. 77° 44' E. Its district of the same name is a subdivision of the Saugor and Nerbudda territory, belonging, as such, to the sub-presidency of the North-western Provinces. It is said to contain 1916 square miles, and 242,641 inhabitants. Besides being so fertile as to be styled the garden of the country, it possesses abundance of excellent coal.

HO'SIERY, in its most limited sense, refers to the manufacture of stockings (hose); but in its more general application, it comprises all knitted goods, whether made by hand or by machinery. The use of stockings originated in the cold countries of the north, and probably the first were made of skins, and subsequently of cloth; they were also, until a comparatively late period, made all in one piece with the trousers, constituting the trunk-hose of our ancestors; but these garments were separated; and the art of knitting was invented, it is supposed in Scotland, about the commencement of the 16th century. Certain it is that knitted stockings found their way to France from Scotland, and led to the

establishment of a guild of stocking-knitters, who chose for their patron saint St Fiacre of Scotland. In 1589, William Lee, of Woodbridge, Nottinghamshire, entirely altered the hosiery trade, by inventing the knitting-frame; and although he did not live to enjoy much benefit himself from it, it soon became a very important aid to the commerce of this country. During the Protectorate, the stocking-frame knitters obtained a charter, and extended their operations through the provinces of England, but with all the disadvantages of a monopoly, which eventually led to legal proceedings, by which the charter was set aside in 1753. Since that time, many improvements have been made in the stocking-frames, and it may be fairly said that four-fifths of the stockings now worn through the world are made by the manufacturers of Great Britain. The ingenious contrivances by which this vast work is produced, will be described under STOCKING-FRAME.

Stockings are made of cotton, of worsted, or of cotton and worsted mixed, called Angola, and of silk. They are each made of two distinct kinds. The best are made in a flat web, which has to be sewn at the back as well as the foot, and it is so made that when the two edges are brought together at the back, they give the form of the calf. The common or *racked* stockings are woven in a circular frame, and form a cylindrical web of equal width from top to bottom; these have to be stretched on boards to give them the shape, and are ironed with hot irons whilst on the board, to make them retain the shape of the board. The foot is formed by cutting the web and adding a small piece for the sole. Nottinghamshire, which gave birth to the inventor of the stocking-frame, is still the centre of the hosiery trade in Great Britain. At Belper, in Derbyshire, stockings of very fine quality are produced; but the cheaper sorts of stockings, gloves, singlets, &c., are made in Nottingham or its immediate neighbourhood.

HOSMER, HARRIET, an American artist, was born at Watertown, Massachusetts, in 1831. As she had a feeble constitution, her father, a physician, encouraged her to strengthen it by out-door exercises, and she became an adept in shooting, riding, rowing, skating, and swimming. She also shewed a talent for sculpture by modelling figures in clay. To prepare herself for her chosen career, she studied anatomy, first with her father, and afterwards at the medical college at St Louis. Returning to her home in 1851, she modelled her first work, 'Hesper,' which had so decided a success that she was sent to Rome, where she became the pupil of Gibson. In his studio, she has modelled busts of 'Daphne' and 'Medusa,' and a statue of 'Enone' for a gentleman of St Louis; and the much admired statue of 'Beatrice Cenci' for the Mercantile Library of that city. Her statue of 'Puck' has been honoured by orders for copies from His Royal Highness the Prince of Wales, and the Duke of Hamilton. Her most ambitious work, finished in 1859, was a colossal statue of 'Zenobia in Chains.'

HO'SPICE, the name given to the pious establishments kept up by the monks on some of the Alpine passes, for the purpose of affording assistance and shelter to travellers. The oldest of these is that on the Great St Bernard (see BERNARD, GREAT Sr), which the priests of the canton of Valais gained possession of in 1825, and afterwards fitted up in a comfortable manner. A hospice likewise existed on St Gothard as early as the 13th century. At present, however, it is inhabited not by monks, but by a hospitaller, who entertains travellers gratis, and accepts no remuneration beyond a present.

Similar establishments are found on Mont Ceniz, the Simplon, and the Little St Bernard.

HOSPITAL, in Law, is used in England to denote an eleemosynary corporation founded for the purpose of supporting certain descriptions of persons; whereas, in Scotland, it more frequently signifies a mortification or endowment for the education as well as support of children. In both countries, it is also used, popularly, to denote an institution for dispensing medical assistance to the poor gratuitously.

HOSPITAL, DAMES OF THE. See SISTERS OF CHARITY.

HOSPITALLERS, charitable brotherhoods founded at various times and in different countries, for the care of the sick in hospitals. The vow to devote themselves to this work of mercy is, in all these brotherhoods, superadded to the ordinary vows of poverty, chastity, and obedience, which are common to all the religious orders in the Church of Rome. One of the earliest recorded instances of a hospital served by such a brotherhood is that of Constance in the 13th century.

The KNIGHTS OF ST JOHN OF JERUSALEM (q.v.), as also the TEUTONIC KNIGHTS (q.v.), were originally hospitaliers. The hospitaliers of Our Lady of Christian Charity were founded near Chalons in the end of the 13th c., by Guy de Joinville; a similar body at Paris in 1294; and the hospitaliers of Our Lady Della Scala about the same time at Siena. The history of the Brethren of Mercy, founded by ST JOHN OF GOD, will be found under that name. There are many other local institutes or congregations, all of which, however, recognise the same general rules, and follow the same general organisation.

HOSPITALS are so called from the medieval *hospitia*, or more properly the class of hospitals established very generally for the reception and relief of lepers, whose malady was one of the scourges of Europe. These leper hospitals were very commonly in England and in Scotland called 'Spitals'; hence the frequency of such names of places as Spital, Spitalfields, &c. The leper hospitals, and other kinds of the old *hospitia*, disappeared with the improvement of society, and substitutes for them on a broader scale began to be established in the modern form of hospitals. Of public establishments under this general designation, there are now, as is commonly known, three distinct classes—hospitals for the reception and treatment of the sick and hurt, hospitals for the board and education of children, and hospitals for the reception and permanent board of poor old persons of both sexes. Hospitals of these several classes are numerous and on a munificent scale in Great Britain, where they take the position of leading charities in the country. As, in the present work, the more remarkable hospitals receive some notice under their respective heads, we need here only offer a few general observations.

HOSPITALS for the sick and hurt are in some parts of England and Scotland termed *Infirmaries*. Under whatever designation, institutions of this kind are now established in all parts of the civilised world, supported, as in England, on a principle of charity, or, as in France, chiefly from the funds of the state or the civic municipalities. The primary or more important object of all such institutions is to mitigate bodily suffering, whether that arises from natural or accidental causes, in which respect they are indispensable as a refuge to all who are unable to pay for private medical or surgical aid, or as a convenient means of succour on emergencies to persons of every rank and degree of opulence.

While such is the main object of these benevolent institutions, they are in numerous instances serviceable as schools for medicine and surgery; as such, no university, at which these and kindred branches of learning are taught, can be said to be complete without the adjunct of a well-organised hospital, where professors can practically educate their pupils by pointing out varieties of disease and injuries, and exemplifying methods of treatment. Hence, the best specimens of hospitals are found in university towns—as in London, Paris, Edinburgh, and some other cities famed as schools of medicine and surgery. The older of the London hospitals are, St Thomas's, 1553; St Bartholomew's, 1546; and Bethlehem, 1547. A considerable accession to the number took place in the reign of George II., when society became alive to the value of such institutions. It was at this period that the Royal Infirmary of Edinburgh was established (1736). The antiquity of British hospitals sinks into insignificance in comparison with that of some institutions of this kind on the continent. The *Hôtel Dieu* in Paris, which is alleged to be the most ancient hospital in Europe, was founded in the 7th c., and long known as the *Maison Dieu*, received the benefactions of successive sovereigns. It is now conducted on a stupendous scale. Houses of this kind in France usually receive valuable aid from a religious sisterhood, renowned for its practical benevolence, the Sisters of Mercy. A striking example of these women's unselfish and useful labours is furnished at the great hospital for the sick and hurt at Lyons, where the entire establishment—cooking, nursing, dispensing medicine, &c.—is gratuitously conducted by them.

In London, Paris, and other large seats of population, the pressure for admission by patients, and likewise the necessity for classifying and properly attending to large numbers, have led to the establishment of hospitals for special departments of medical practice. Thus, besides the general hospitals, there are now lying-in hospitals, ophthalmic hospitals, consumptive hospitals, children's hospitals, &c.—each with its peculiar accommodation, and its appropriate staff of officials. Independently of these, there are hospitals for the treatment of mental maladies, of which Bethlehem and St Luke's in London, and the establishments in Paris, known as *Hospices*, are examples. To this class of institutions belong Lunatic Asylums (q.v.), also asylums for the reception and treatment of naturally imbecile children; these last, though in operation for some time in France and Switzerland, being but of recent establishment in Great Britain. To all these institutions under civil administration, are to be added those hospitals which are maintained by the English, French, and other governments for the military and naval services.

No part of the social economy of European countries is so perfect in its organisation, so purely humane, and so unobjectionable on the score of promiscuous charity, as the institution of public hospitals or infirmaries. As means of relief and schools of medicine, they appear to be absolutely essential to every dense community; not the least of their valuable qualities being that, by their prompt and liberal action, they interpose to stem contagious distempers which, if unchecked on their outbreak, might visit and decimate families who are far removed above the need of gratuitous medical attendance. On this latter ground, as well as from sentiments of benevolence, the hospitals or infirmaries of England, Scotland, and Ireland are the objects of much solicitude to the general community; it being customary for wealthy individuals to bequeath sums towards their support, and for

public subscriptions and church collections to be made for them annually. In some cases, besides the infirmaries so miscellaneously sustained, hospitals are erected and maintained wholly by endowment.

A leading peculiarity of medical hospitals is their good order and cleanliness. They are mostly large edifices, and though, in a sanitary point of view, best placed in airy situations, they are for the sake of convenience usually situated in the neighbourhoods where they are particularly required. Internally, they are arranged in wards, each under its own nurses, with general superintendents, and a suitable body of servants. Being open night and day to receive pressing cases, there is a resident surgeon with assistants constantly in attendance. Scrupulous cleanliness, quiet, decorous conduct, exclusion of intoxicants and of miscellaneous visitors, are among the points principally attended to by the managers.

The Middlesex Hospital, parish of Marylebone, may be taken as a fair specimen of a general hospital in England. It is a large building, disposed in the form of the letter H, which admits of thorough ventilation in all the passages. It comprehends 310 beds, of which 120 are for medical, and 190 for surgical cases. Three wards are set apart for the reception of 26 poor women affected with cancer, a class of cases when seemingly incurable not usually admitted into general hospitals. The staff consists of three physicians, who take charge of the medical cases in the wards; a physician-accoucheur, who devotes himself to the diseases peculiar to women and infants, and who superintends the working of the maternity department; four surgeons, who take charge of the surgical patients; and assistant-physicians and surgeons, who take care of out-patients. Resident house-surgeons and an apothecary with assistants, attend to all emergencies in the absence of physicians and surgeons, and summon them if necessary. Attached to the hospital are a chaplain and secretary. The physicians and surgeons, who give their services gratuitously, act as professors in the medical college. The management is conducted by governors, and a medical and weekly committee. In and out door patients are admitted by letters of recommendation from governors or subscribers to the funds, but in cases of cancer and diseases of the eye, and in cases of emergency, the recommendation is dispensed with. The annual number of patients received into the hospital is about 2100, and 18,000 receive attendance at their own homes. No lying-in patients are now admitted into the hospital, but about 800 poor women are yearly delivered at their own dwellings, by pupils and midwives, under the direction of the physician-accoucheur. The total expense incurred is less than £11,000, of which more than a half is from endowment, and the remainder from subscriptions, donations, legacies, and miscellaneous collections. A separate fund is provided to assist poor patients leaving the hospital, who may be deficient in clothing or other necessities.

As in some degree allied or auxiliary to hospitals, there are two kinds of establishments deserving notice. The first to be mentioned are public *Dispensaries*, where, at stated hours, medical advice and medicines are given gratis to applicants; and though like other forms of charity liable to abuse, it is allowed that these institutions are of much value in the midst of poor communities, and also, like hospitals, are a means of staying the course of contagious distempers. The other institutions to be noticed are those called in France *Maisons de Santé*. These establishments are private hospitals for the reception and treatment of patients who are able and disposed to pay a small sum for board and

medical or surgical attendance. A common charge is from three to five francs a day. Under the name of *Sanatorium*, an attempt has been made to introduce this kind of institution into England, where, however, from various circumstances, including the generally good home-accommodation of the middle and sub-middle classes, the institution has not become so popular as it is in Paris.

HOSPITALS for the board and education of the young are more varied in character and more numerous in Great Britain than in any country in the world. Consisting for the most part of large and handsome buildings, placed in salubrious situations in the environs of cities, some are specially adapted for boys, some for girls, and less frequently they are for both; some are maintained by endowments from deceased benefactors, some by funds connected with trade incorporations, and some by casual donations and subscriptions. The oldest, and those on the most munificent scale, are of the class first mentioned; as, for example, Christ's Hospital, London, and Heriot's Hospital, Edinburgh. Donaldson's Hospital, Edinburgh, belongs to this class; and so likewise does the Girard College, Philadelphia, which costing for construction nearly two millions of dollars, and giving accommodation to upwards of 300 orphans, is not excelled in point of architectural grandeur, or in munificence of private endowment, by any European hospital for children. In the whole of this class of institutions in Great Britain there is a similarity of arrangements. The inmates are assumed to be orphans, or the children of parents in reduced circumstances; they are admitted at about six or seven years of age, and kept till about fourteen; they receive gratuitous board and education within the establishment; and they wear a uniform according to the fancy of the directors—the dress being in some instances in England antiquated and ridiculous. There is ordinarily a keen competition among parents and guardians to procure the admission of children into these hospitals, for the benefit to be secured is deemed equal to a gift of £200 to £500. Hence, as may be supposed, the charity, to call it so, is frequently abused. As residence within such establishments for a period of six or seven years, interrupted only by holidays, involves a withdrawal to that extent from the family circle, serious objections have lately been taken to the marked and necessary deficiency of hospital training. On this ground, as well as from their pauperising tendency, hospitals for children are suffering in public estimation; and extended in number beyond all reasonable bounds, as they are in Edinburgh and some other places, are remonstrated against as being inconsistent with a sound social economy.

HOSPITALS for indigent old men and women are found in several European countries, but nowhere are they so common as in Great Britain and the Netherlands, where begging is rigorously proscribed by the police, and almsgiving assumes the character of rates for support of the poor. The work-houses for the reception of parish paupers are the humblest variety of these hospitia, though as seen in some parts of England and Scotland, they are on a vast scale of accommodation, adapted to the wants of unions or clusters of parishes. Considerably above these in point of comfort and liberality of management, are the hospitals endowed by individuals or by incorporations for persons who once occupied a respectable position, and have through misfortunes lapsed into decayed circumstances. Almost every city of any note in the United Kingdom has one or more of this species of hospital; the claim for admission being ordinarily a privilege of local burgesses or members of incorporated

crafts. Analogous to this class of institutions are Greenwich Hospital for superannuated mariners connected with the Royal Navy, and the Military Hospital, Chelsea. In England there are numerous establishments called Alms Houses. These are of the nature of hospitals for indigent men and women of respectable character, but with this difference, that instead of all living in wards under one roof, the inmates are each provided with a small dwelling for him or herself, and receive the means of separate livelihood. These establishments, consisting of clusters of neat small cottages in contiguity, or of separate dwellings grouped in the form of a spacious building, abound in London and its vicinity, where they afford pleasing examples of the munificence of opulent benefactors, and incorporated city companies. At St Cross, near Winchester, and at Coventry, there are Alms Houses curious from their antiquity and external appearance. The noblest example of this class of institutions is the Charter-House, London, described in the present work.

W. C.

HOSPITALS, MILITARY, establishments for the reception of the sick and wounded of an army. The smallest is the Regimental Hospital, under the medical officers of the regiment; next, there is the Divisional Hospital, presided over by staff medical officers, for the benefit of all the corps in the division; and, lastly, there is the General Hospital, applicable to the whole force. In these hospitals, the medical officers are responsible directly to the Secretary of State for War for all purely medical functions. With regard to discipline, inspections, and other military duties, the principal medical officer is responsible to the commandant of the regiment or division, who in his turn is answerable to the general-in-chief for the state of the hospitals in his command. Soldiers while in hospital are subjected to a stoppage of 9d. a day from their pay if abroad, 10d. if at home. The amount of these stoppages for 1862 was £111,000, in addition to which the military hospitals were estimated to cost the country £101,819. There are several large military hospitals at home—e. g., Netley (q. v.), Fort Pitt for lunatic soldiers, Yarmouth, &c. In the French army the service of the Field Hospitals forms part of the intendance of the army, the medical officers in charge being under the supreme control of the intendant-general.

HOSPITALS, NAVAL, establishments for the cure of sick and wounded seamen. They are served by naval medical officers, and if at home, for purposes of discipline, have each a captain-superintendent, and one or more lieutenants. The only naval hospitals at home which are at present kept up are at Haslar (q. v.) and Plymouth; but abroad there are such establishments at Malta, Bermuda, Halifax, Jamaica, the Cape, and Hong-kong. The annual cost of the staff for naval hospitals amounts to about £20,000.

HO'SPODAR is the title now usually given to the governors of Moldavia and Wallachia. Formerly, they were called by the Turks, Beys; by the Slaves, Wojewods. The latter title is frequently given in connection with that of hospodar, the term wojewod signifying the right and dignity of leading the army (being thus identical with Duke), while hospodar (gospodar, gospod, gospodin, in the various Slavonic dialects) means simply, master (dominus). Formerly, the Lithuanian princes were likewise called *hospodars*, and the Polish kings, down to the time of Sobieski, assumed this title in their diplomatic negotiations with Russia. *Gosudar* (ruler, monarch) is even now the title of the Emperor

of Russia, and in ordinary conversation signifies master. See MOLDAVIA, WALLACHIA.

HOST (Lat. *hostia*, a victim), the name given in the Roman Catholic Church to the consecrated bread of the Eucharist. It is so called in conformity with the doctrine of that church, that the Eucharist is a 'sacrifice,' in the strict sense of the word. The host in the Latin Church is a thin circular disc of unleavened bread, made of the finest flour, and generally bearing some emblematic device, as the Crucifixion, the Lamb, or some words or initials of words having reference to the sacrifice. In the Greek and other Oriental churches, as well as in the various Protestant communities, the Eucharist is celebrated in leavened bread, only differing from ordinary bread in being of a finer quality; and one of the grounds of separation from the West alleged by Michael Cerularius was the western practice of using unleavened bread. The Greek and Protestant controversialists allege that, in the early church, ordinary or leavened bread was always used, and that our Lord himself, at the Last Supper, employed the same. Even the learned Cardinal Bona, and the Jesuit Sirmond, are of the same opinion; but most Roman divines, with the great Mabillon at their head, contend for the antiquity of the use of the unleavened bread, and especially for its conformity with the institution of our Lord, inasmuch as at the paschal supper, at which 'he took bread, and blessed, and brake it,' none other than the unleavened was admissible (Exod. xii. 8, 15; Levit. xxiii. 5). See Klee's *Dogmatik*, iii. 190.

HOST, JENS KRAGH, a Danish historian, born at St Thomas, 15th September 1772, and died 26th March 1844. The great aim of his literary career was to create a conviction of their unity among the Scandinavian nations. With this view, he established, in company with Nyerup, Pram, and Baggesen, the Scandinavian Literary Society, which originated the journal entitled the *Scandinavian Museum*. His most important work is *Count Struensee and his Ministry* (3 vols. Copenh. 1824), which was the first attempt to delineate, in a thoroughly impartial manner, the events of that singular period in Danish history. Among his other writings are: *Svenske Blade*; *Euphrosyne*; *Dannora*; *A Swedish Grammar and Dictionary for Danes*; *Lectures on the Swedish Language and Poetry*; *Life and Government of Gustavus Adolphus*; *Memorials of the Life and Government of Christian VII.*; and *History of the Danish Monarchy under Christian VII.*

HO'STAGE (through the French *otage* (ostage), from the Latin *obes*), one given in pledge for the performance of conditions. When a town capitulates, victors and vanquished usually give into the custody, one of the other, several officers, as pledges that each party will duly carry out the terms stipulated. When the terms are fulfilled, the hostages are exchanged; but if the terms be evaded, the opposite side holds the right to put to death, or otherwise punish, the hostages in its possession. It is needless, however, to add that, in modern civilised warfare, the circumstances would have to be very remarkable indeed to be held to justify so cruel a measure as the execution of a hostage.

HOSTILIUS, TULLUS, grandson of Hostus Hostilius, the champion of Rome in the first war with the Sabines, succeeded Numa Pompilius on the throne of Rome, 670 B.C. According to Livy and other writers, H. made the famous arrangement, by the combat of the Horatii with the Curiatii, for the decision of the question of supremacy between Rome and Alba, which was decided in favour of the former; he fought against Fidenæ and Veii, and conquered these cities, destroyed Alba, and removed the inhabi-

tants to Rome, giving them Mount Cælius to dwell on, and carried on war against the Sabines. As he grew old, he became more pacific in his inclinations, and determined to attend more diligently to the worship of the gods, but he had too long provoked them by his negligence to be forgiven, so that, when he wished to inquire of Jupiter Ellicius, the god consumed H. and his house with fire, about 638 B.C. According to Niebuhr, Arnold, &c., there are glimpses of a distinct personality in the legend of H., unlike those of Romulus and Numa, which are merely personifications of the two principal stages of a nation's growth.

HOTBED, a heap of fermenting matter, covered with a layer of earth, and generally surmounted with a frame, for the cultivation of plants which require more than the natural heat of the climate and season, but not so much as to render the hothouse necessary. The heat is the result of fermentation. Hotbeds not being expensive, are in very general use; as for growing melons, and, in the northern parts of Britain, cucumbers, for raising ornamental plants from seed in spring, to be planted in the open ground as summer advances, &c. The material mostly used is stable-dung, or a mixture of horse-dung and litter; but tanners' bark, leaves, the waste of flax, cotton, or woollen factories, &c., are sometimes substituted for it. The heat of a very rapid fermentation being too great, it is necessary that this be over before the hotbed is planted; and it is usual, on this account, to prepare the materials for some time before it is formed. A hotbed is made highest at the back, sloping—in the northern parts of the world—towards the south. The bed extends on all sides six inches or thereby beyond the frame, which has a movable glass sash or sashes, according to its size. The thickness of the hotbed, and of the earth upon it, are accommodated to the purpose intended, and the degree of heat required. When the heat decreases, it is for some purposes necessary to keep it up by *linings* of the same material as the hotbed, added to the sides of it. The sashes of hotbeds must be partially removed during the day, to permit ventilation and the escape of vapour.

HOTHOUSE, a building intended for the cultivation of exotic plants requiring a higher temperature than that of the open air. The term is sometimes employed to include even the green-house and conservatory, but more generally it is applied to those buildings in which artificial heat is kept up at all seasons of the year, as the Bark-stove (q. v.), Dry-stove (q. v.), forcing-houses, pinery, peach-house, &c. Hothouses resemble green-houses in their general form and structure, and with most of the same varieties in both. It is important that they have a good exposure, so that the plants may enjoy as much sunshine as possible; and the free admission of air to the utmost extent allowed by the requirements of climate, is very advantageous. The oldest mode of heating hothouses is by furnaces and flues; the other modes practised are by steam, or by hot water led through the house in tubes, and by hot air admitted into the atmosphere of the house. Into the details of these modes, we cannot enter.

HOT SPRINGS, a small village in Arkansas, United States, America, 53 miles west-by-south of Little Rock, and celebrated as a resort for invalids to the hot springs which give the name to the village and the county. Fifty springs, from 110° to 150° F., break out from the west side of a mountain, and flow into a creek, which empties into the Wachita river, six miles distant. There are also cold chalybeate springs, much frequented, and sulphur springs, in the same county.

HOT WALLS, or **FLUED WALLS**, in Gardening, are walls furnished with furnaces and flues, in order to the production of finer kinds of fruit than could otherwise be expected in the climate. The flues are led as obliquely, and make as many turns from right to left as are consistent with their drawing well, so that as little heat as possible may escape by the chimney, and as much as possible may be expended on the wall. The heat is applied chiefly during spring. At that season, also, movable glazed frames, or sometimes mere screens, are placed in front of the walls.

HOTCHPOT, a phrase used in English law to denote that where one child has already received an advancement out of the father's personal estate, that child must bring such sum into hotchpot before he will be allowed to share with the other children, under the statute of distributions, after the father's death. In other words, a child who has got money from the father to place him in business, &c., must treat that as a payment to account of his share at the father's death. A similar, but not identical doctrine exists in Scotland under the name of **COLLATION** (q. v.).

HÔTEL, originally *Hostel*, or *Hostellerie*, a French term applied to an inn, or house for the temporary accommodation of travellers. The term, however, is also applied in France to the town mansion of a distinguished personage, and in like manner the word inn was at one time indifferently used in England to signify the town residence of a great man. The name *hostellerie* was applied by Chaucer to a public inn, and till a more recent period it was similarly used in Scotland. From its general use comes the designation *hostler*, which originally signified the keeper of the inn or hostel. Only in recent times has the significant old English word inn been eclipsed by the reintroduction of *hostel*, under the softened form of *hôtel*.

An account of inns ancient and modern, under whatever designation, would form an interesting chapter in social history. The Caravansarai (q. v.) of the East is the most ancient species of inn of which there is any notice. The Greeks and Romans did not improve on the quality of these oriental establishments. Their inns, if worthy of the name, were little better than receptacles for humble classes of wayfarers, or places where cooked food and wine were dispensed to the hungry and thirsty stranger. Along their highways, the Romans gave encouragement to these primitive varieties of inns; the best of such establishments being called *caupona*, or *taberna diversoria*, while those of an inferior kind were known as *popinae*, of which some specimens have been disclosed at Pompeii.

The duties of hospitality and also the obligations of religion long postponed the introduction of regular inns. In medieval times, the castles of the barons offered shelter with straw, and sometimes food, to the wayfarer of high and low degree, and there are traditions to the effect that to pass some of these strongholds without calling to render obeisance, and receive the hospitality of the owner, was deemed an insult. But the monastic establishments, great and small, scattered over every part of Christendom, formed the chief *hospitia*, (see **HOSPICE**). With the general improvement of society and the increasing concourse of travellers came the modern inn, or professional hospitium, at which entertainment for man and horse was afforded as a matter of business. Nowhere in Europe did this class of establishments so soon attain to a determinate and respectable character as in England. Growing first into importance in London, York,

Oxford, Bristol, and some other cities, the substantial and well-managed English inn was imitated on a smaller scale in the different provincial towns, and gained a good standing in national usage before it spread to Scotland; the inns of which, even up to the middle of the 18th c., were on a meagre scale of accommodation. It is not necessary to call to mind more than a few of the interesting old inns in London, all celebrated less or more from their respective signs: the *Angel* at St Clement Danes, and *Angel* at Islington; the *Bell*, Warwick Lane, Newgate Street; *Belle Savage*, Ludgate Hill; *Bull and Mouth*, St Martin's-le-Grand; *Four Swans*, Bishopsgate Street; *Saracens Head*, Snow Hill; *Golden Cross*, Charing Cross; *White Horse*, Fetter Lane; and *Tabard* (now *Tabbot*), Southwark. For brief notices of these and others, see *Curiosities of London*, by J. Timbs. For the most part, the old inns of London, Westminster, and Southwark, consisted of a building round a courtyard, entered from the street by a wide covered passage. The ground-floor was disposed as stables, kitchens, and other offices, with a large reception-room; above, were the lesser apartments and bedrooms, these last all opening on hanging wooden galleries, whence the inmates could look down on the busy scene of arrivals and departures in the courtyard beneath. Some specimens of these old inns with open galleries still survive. Such was the *Tabard*, renowned as the *hostellerie* from which Chaucer's pilgrims set out for Canterbury. There is reason to believe that this form of construction was derived from the arrangement of ancient Roman villas, which consisted of buildings round a series of courtyards; hence, also, the form of French *hôtels*, public and private. Modern Italy has examples of inns of this form. We may allude particularly to the *Hôtel de Ville* at Milan, and the *Albergo delle Due Torri* at Verona; this last having hanging galleries round a courtyard in precisely the old English style.

Of the character and management of the inns of England, with their offers of 'entertainment to man and horse,' we are favoured with innumerable glimpses in the fictions of Fielding, Smollett, Goldsmith, and others—the jolly hostess, the obsequious waiters, the bouncing chambermaids, the hostler who takes the traveller's nag, and above all the garrulous host who, when invited, gives his company to his guests, tells them the news, and at dinner, according to use and wont, places the first dish on the table. See *Dr Syntax's Tour in Search of the Picturesque*, illustrated by Rowlandson, for some humorous delineations of inn-usages. The great personal comfort and independence of feeling enjoyed in English inns is frequently referred to in literature. Archbishop Leighton, who died 1684, in the *Bell*, Warwick Lane, 'often used to say, that if he were to choose a place to die in, it should be an inn; it looking like a pilgrim's home, to whom this world was all as an inn, and who was weary of the noise and confusion of it. And he obtained what he desired.'—Burnet's *Own Times*. Dr Samuel Johnson, as is well known, expatiates on the delights of an English inn; on one occasion, as related by Boswell, repeating with great emotion Shenstone's lines:

'Whoe'er has travelled life's dull round,
Where'er his stages may have been,
May sigh to think he still has found
The warmest welcome at an inn.'

English inns have not lost their reputation for comfort and the attention paid to guests; but the almost entire alteration in the methods of travelling by the introduction of railways has left them

considerably behind the requirements of the age. Except in the smaller towns and villages, they have been superseded by *hôtels*—that is, houses of a more pretentious kind. The better classes of these *hôtels* contain private parlours for families or individuals who choose to be alone, also a large apartment for travellers generally. Houses frequented by commercial travellers have a room set apart for this class of customers. The plan of taking meals at a *table-d'hôte* has not hitherto made much progress in England, as if it were somehow contrary to the national reserve and exclusiveness. The marked defect in the modern *hôtels* in London and elsewhere in England consists in their insufficient size. The greater number are merely private houses transformed for the purpose, and are inadequate to meet the swollen dimensions of railway traffic. The truth is, the establishment of inns or *hôtels* in any part of Great Britain has not hitherto been looked to as a profitable investment for a large capital. The business of innkeeping has been thought a little derogatory, and few except old waiters, who had realised some money by their services, embarked in the business. On the continent of Europe, the trade of *hôte*-keeping enjoys a considerably higher social status. A large capital is invested, the keeper or manager is a man of local note, and the waiters or *garçons* are young men who follow the business as a profession in which they expect to rise by their diligence and acquirements. In point of fact, the *garçon* is much above the English waiter in his aims. He voluntarily undergoes a kind of curriculum of education, by passing from the *hôtels* of one country to those of another, and does not consider himself proficient till he speaks German, French, Italian, and English; at the very least, if of German birth, speaking French with fluency. Some good and capacious *hôtels*, built distinctly as such, have lately been established at the principal railway termini in London, also at Dover and a few other places. With these exceptions, the *hôtels* of England are far behind the new high-class *hôtels* of the continent; nor do we know of any English *hôte* which approaches in grandeur or extent to the *Hôtel de Louvre* in Paris, the *Metropole* at Geneva, or to some of the magnificent *hôtels* at Hamburg. But while we now write (1862), projects are on foot to build several *hôtels* in London worthy of the place, and corresponding to the vastness of modern demands.

In England, the *hôte* system of living is simply that of paying for what is called for, with the addition of a certain charge per diem for the rooms which are occupied; in France and other continental countries, this plan is so far modified by the plan of dining at a *table d'hôte*, which lessens the general expenses. Both in English and continental *hôtels*, the charge for attendance is now made explicitly in the bill, a very grateful improvement. The ordinary *hôtels* in all parts of the United Kingdom are licensed by magistrates to sell wines, spirits, and other excisable liquors, and therefore come under the category of public-houses open to the supervision of the police. In the higher-class *hôtels*, however, the supply of liquors is confined to the resident guests; and it is only in the others that drink is sold as in taverns. See TAVERN. Latterly, there has sprung up a class of houses, some of them on a considerable scale, known as *Temperance Hôtels*, which have no licence, and do not supply any excisable liquors. See TEMPERANCE MOVEMENT.

Throughout the United States of America, the system of *hôtels* has taken a peculiar turn. The *hôtels* are built for the purpose, and usually very large; with few exceptions they are conducted as

boarding-houses on the plan of charging so much per diem, everything included excepting liquor, which is obtainable in a large drinking-room called the bar. A common charge is about 10s. 6d. sterling a day. All the meals are given with liberal profusion in the *table-d'hôte* fashion; and as absence from these entertainments—to dine with a friend, for example—makes no difference of charge, the system, though simple and adapted to a constant flow of customers, is not without its disadvantages. Elegant in their architecture, and spacious and commodious in their interior arrangements, the American *hôtels* are got up at great expense, as may be judged from their extensive accommodation, which ranges from 180 to 800 rooms. The *Astor House*, the *St Nicholas*, and the *Metropolitan*, at New York, are among the largest and most splendid of these establishments. The system of American *hôtels* is generally followed in the British colonies.

W. C.

HOTTENTOT COUNTRY, a region of South Africa, stretches indefinitely to the N. from the Cape Colony, having the Atlantic on the W., and the Bechuanas and Kafirs on the E. In E. long. it extends between 15° and 27°; and in S. lat. between 31° and some line to the north of the tropic of Capricorn. This territory is but of little value. Its principal river, the Orange, is almost useless for navigation; and though here and there well wooded, yet the surface is chiefly an arid desert. The only examples of civilisation are to be found in several missionary establishments.

HOTTENTOTS is the name generally given by Europeans to a singular race of people, supposed to be descended from the aborigines of Southern Africa, and now dwelling for the most part in and about the English settlement of the Cape of Good Hope. The origin of the name *Hottentot* is uncertain. Some think it is of Dutch origin; a word coined by the early Dutch settlers to convey by the sounds *Hot en Tot*, *Hot and Tot*, some idea of the peculiar clicking noise made by the people when speaking. Dampier, however, wrote the name *Hodmadods*, instead of H.; and Prichard says that it is probably a corruption of *Houteniqua*, the name of a particular tribe now extinct, or at least unknown. They now call themselves by various names, supposed to be those of tribes, as *Attaquas*, *Hessaquas*, *Dammaras*, *Saabs* or *Saaps*, *Namaquas*, and *Koranas*; and by the collective name of *Quai-quæ*, or *Gkhuigkhui*.

In the ethnological classification given by Dr Latham, the H. are ranged under the second great division of the human family—*Atlantidæ*. In the older classification, that of Blumenbach, they are ranged under the third great division of the human race—the *Ethiopians*—under which division that author also places the negroes. But the H. are not like the negroes, and are more akin to the Mongolians; having broad foreheads, high cheek-bones, oblique eyes, and a dirty, olive-coloured complexion. The width of the orbits, their distance from each other, the large size of the occipital foramen, are points in which the H. resemble the northern Asiatics, and even the Esquimaux. The person of the *Hottentot*, when young, is remarkable for its symmetry. The joints and extremities are small, and the males look almost as effeminate as the women. The face, however, is in general extremely ugly, and with age this ugliness increases. Sir John Barrow, in describing the *Hottentot* women, observes of them that before child-bearing they are models of proportion, every joint and limb rounded and well turned, their hands and feet small and delicate, and their gait by no means deficient in grace.

'Their charms, however, are very fleeting. At an early period of life, and immediately after the first child, their breasts begin to grow loose and flaccid, and as old age approaches, become distended to an enormous size; the belly protrudes; and the hinder parts swelling out to incredible dimensions, give to the spine a degree of curvature inwards that makes it appear as if the *os coccygis*, or bone at the lower extremity of the spine, was elongated and bent outwards, which is not the case.' The appearance of the Bosjesmen or Bushmen, who are the most degraded tribe of the H., is still more revolting.

The language of the H. is quite as singular as their personal appearance. It has been called 'the click language,' and has also been compared to the clucking of a hen when she has laid an egg. The dress of the Hottentot in his native state is exceedingly simple, being merely a strip of the skin of some animal tied round the waist, from which there depends a sort of apron, that hangs down both before and behind. This is nearly the same for both sexes, so that in the summer both go almost naked, protecting their persons from the sun by a covering of grease; but in the winter they have a sort of cloak made with skins, that covers nearly the whole body. The H. live in kraals or villages, consisting of a number of circular huts like beehives. They have both oxen and sheep, in the management of which they shew great skill. They are also addicted to the chase, in which they use poisoned arrows, javelins, and spears. Their only manufacture is a rude kind of earthenware; except, of course, that they make their own sheep-skin clothes, such as they are, also their bows and arrows, and other weapons. Like most savages, they have some taste for music, which they practise upon a rude sort of guitar with three strings, and a flute made of the bark of trees. Of religion, there appears to be but very little notion among the H., and they have no particular observances at either births, marriages, or funerals. Dr Prichard, however, observes of them: 'Although the wild tribes of the Hottentot race display ferocity and all the other vices of savage life, yet we have abundant proof that these people are not insusceptible of the blessings of civilisation and Christianity. No uncultivated people appear to have received the instructions of the Moravian missionaries more readily than the Hottentots, or to have been more fully reclaimed and Christianised.'

The H., as a distinct race, first became known to Europeans about the year 1509, when Francisco d'Almeida, Viceroy of India, landing at Table Bay, was killed, with about seventy of his followers, in a scuffle with the natives. They were afterwards frequently visited by navigators from different countries; but no authentic accounts reached Europe respecting them until the Dutch settled in the Cape of Good Hope in the middle of the 17th century. The H. were then much more numerous than at present, but upon becoming addicted to rum and brandy, their numbers diminished gradually. Many of the tribes parted with their flocks and herds to procure the fire-water, and eventually they became the absolute slaves of the Dutch settlers or Boers. From this condition they have been delivered by the enlightened and humane policy of the British government; and as free labourers they make excellent herdsmen and drovers. Their number at present is thought to amount to about fifteen, or from that to twenty thousand, not including those who in all probability may be found dwelling more in the interior. Of the Bushmen, no numerical estimate has been formed. They are widely scattered throughout the English settlements, but their numbers must be very small, while their wretched and

degraded habits are such that it is thought they will soon become utterly extinct.

HOTTO'NIA, a genus of plants of the natural order *Primulaceæ*, of which one species, *H. palustris*.

Water Violet (*Hottonia palustris*):
a, corolla; b, calyx; c, pistil; d, stamen.

Water Violet or Featherfoil, is among the most beautiful of British aquatic plants. It is not found in Scotland. Its leaves are all submerged, crowded, and much divided; the large, beautiful, pale purple, whorled flowers alone rise above water on a long cylindrical stalk. Other species of *H.* are found in the East.

HOUA'RIOS are small coasting-vessels and pleasure-boats used in parts of the Mediterranean. They, bear lateen sails, and have each two masts and a bowsprit.

HOUND (Ger. *Hund*), a name commonly given to those kinds of dog which are used in hunting, but more especially, at least by systematic writers on dogs, to those which hunt by scent rather than by sight. When this definition is adopted, greyhounds are not regarded as true hounds. Examples of true hounds are found in the Bloodhound, the

Old English Hound (*Canis sagax*).

old English Southern hound, the Staghound, the Foxhound, the Harrier, and the Beagle; closely allied to which are also the Pointer, Setter, Spaniel, &c. See these heads. The Hounds are by some naturalists regarded as a distinct species of dog (*Canis sagax*). They are characterised not only by fineness of scent, but by great docility and sagacity.

The muzzle is not so sharp as in greyhounds, nor is the form so slender. The ears are large and pendulous. Some varieties have rough, and some have smooth hair. The rough-haired varieties are generally those which exhibit the most perfect domestication, and in which the attachment to man is closest. True hounds are figured in ancient Egyptian paintings and sculptures. It is believed that all the best varieties were introduced into Europe in comparatively recent times from the East.

HOUNDS, in point of law, render the person who keeps them liable to the dog-tax—viz., twelve shillings each—unless compounded for; but a person who follows the hounds, i.e., goes out hunting with them, does not require a game licence. Though such a person, however, is not punishable summarily by a magistrate for an illegal trespass when following the hounds on a stranger's lands, yet he is liable to an action at law for the trespass, except only in the case of fox-hunting, which to this extent may be called a privileged pursuit, at least in England. In Scotland, fox-hunting is not allowed as an excuse for a trespass; and in England and Ireland, even in following the fox-hounds, no more damage is to be done than what is absolutely necessary.

HOUND'S-TONGUE (*Cynoglossum*), a genus of plants of the natural order *Boraginæ*, of which there are many species, all of a coarse appearance, with small flowers. The **COMMON H.** (*C. officinale*) is a native of Europe, Asia, Africa, and North America; not uncommon in some parts of Britain, especially near the sea-coast. It has soft downy leaves, of a dull-green colour, purplish-red flowers, and a stem about two feet high. Its odour is very disagreeable. The root was formerly administered

Hound's-Tongue (*Cynoglossum officinale*).

in scrofula, dysentery, &c., and is said to be anodyne. It is also one of the pretended specifics for serpent-bites and hydrophobia.

HOUNSLOW, a small town of England, in the county of Middlesex, consists of a single street, stretching along the Great Western Road from London, from which it is distant ten miles west. Its church, a modern building in the Italian style, is surmounted by twelve small spires and a belfry. The numerous inns and posting-houses of H. were busy and prosperous till the opening of the railways to Southampton and Bath. Previous to that event,

its posting business was as extensive as that of almost any town in England. About 800 horses were then maintained here, and about 183 coaches, while 500 coaches passed through the village daily. The Heath, which till the present century was notorious as the scene of frequent highway robberies, is now in great part enclosed. Numerous villas have risen up around the town. On the Heath are extensive gunpowder mills. Pop. (1861) 6032.

HOURL, a measure of time equal to $\frac{1}{24}$ th part of a day. The division of the day into hours seems to have been known to the Babylonians and Egyptians, from whom, first the Greeks, and then the Romans derived it. But their scheme of division extended only to the natural day (while the sun was above the horizon), which they divided into twelve parts. The consequence of this was that the hour constantly varied in length. This system was introduced into Rome by L. Papius Cursor about 293 B.C., and during the Punic Wars, the Romans adopted the division of the night also into twelve parts. This system continued till about the end of the 4th c., when the present system was adopted. In the British Empire, and most continental countries, the day is reckoned from midnight to mid-day 12 hours, and mid-day to midnight 12 hours. In Italy, the day is reckoned from sunset to sunset, and the hours are counted from 1 to 24. The Chinese reckon from an hour (in our time) before midnight till the corresponding time next night, 12 hours, each hour being equal to two of ours. The Japanese still follow the old custom of reckoning from sunrise till sunset. Astronomers reckon from mid-day (on the previous day) to mid-day, counting from 1 to 24.

HOŪRA, a town on the right or west bank of the Hooghly, stands within the limits of the Twenty-four Pargunnahs, in lat. 22° 36' N., and long. 88° 23' E. It is directly opposite to Calcutta, of which it may, in fact, be regarded as a suburb. The river between them is their common harbour; and H., being inhabited chiefly by ship-builders, bears pretty nearly the same relation to the aggregate metropolis of India as Blackwall bears to London in its largest sense. It is hence that the great railway takes its departure for the North-west Provinces.

HOURL-GLASS, an instrument for measuring intervals of time. It is made of glass, and consists of two bulbs united by a narrow neck; one of the bulbs is nearly filled with dry sand, fine enough to run freely through the orifice in the neck, and the quantity of sand is just as much as can run through the orifice in an hour, if the instrument is to be an hour-glass; in a minute, if a minute-glass, &c. The obvious defects of this instrument are the expansion or contraction of the orifice produced by heat or cold, and the variations in the dryness of the sand, all of which produce deviations from the true measurement of the time. The hour-glass was almost universally employed in churches during the 16th c., and continued in use till about fifty years ago. In several of the churches in England, hour-glass stands of elegant workmanship are still to be seen.

HOUSATONIC, a river of New England, which rises in Massachusetts, and flows southwardly through Connecticut into Long Island Sound. Its length is about 150 miles, through a picturesque country, and its numerous falls afford water-power to many manufacturing villages. For forty miles its course is followed by the Housatonic Railway.

HOUSE, in point of law, is an Englishman's castle, though not a Scotchman's. In other words, when a man shuts himself up in his own house, no bailiff can break open the door to arrest him, or

seize his goods for debt in England or Ireland, and no court can give a bailiff such power; in Scotland, however, even a man's own house is no protection, for leave can be got from the court, often called on that account the Queen's keys, which enables the messenger to break open the outer-door and arrest. In England, therefore, if a person can manage to procure supplies from without, he can fortify himself against the enemy for any length of time; but though it is not competent for the bailiff to break open the outer-door by force, yet every trick or stratagem is fair in order to effect a peaceable entry, and once in, he cannot be turned out. Where the party is charged with a criminal offence, a constable armed with a warrant, or in some cases without, is entitled to break into the house and arrest him, both in England and Scotland. A man is entitled also to defend his house against trespassers and thieves, using no greater force than is necessary; and if necessary in that sense, he may even kill the intruder, though very strong circumstances are required to justify this. He may also put spring-guns on the premises. In Scotland, a peculiar name is given to the offence of feloniously assaulting a man in his own house, called *Hainsucken* (q. v.), though in England it is not singled out by a separate name; yet all offences committed in a house are generally punished more severely. *Housebreaking* is a technical name in Scotland, but in England is a popular phrase, the legal terms being larceny or robbery in a dwelling-house, or burglary, according to the circumstances.

HOUSE OF COMMONS. See **PARLIAMENT.**

HOUSE OF CORRECTION, a jail which is not under the ordinary charge of the sheriff, but is governed by a keeper; it is also sometimes called a *Bridewell*. These houses were originally intended for the detention of vagrants and convicted persons, and compelling these to work; but their purpose is now extended in England. Every county, and most cities and towns, must have one. The persons who may be committed to them are prisoners convicted of felony, or misdemeanour; persons committed on charge or suspicion of felony, or of misdemeanour; and vagrants. And generally any justice may commit to the House of Correction persons awaiting their trial, and persons convicted of small offences. The prisoners are classified, and the regulations are generally defined by 4 Geo. IV. c. 64, 5 and 6 Will. IV. c. 38. In Scotland, the regulation of prisons is transferred to a Board of Directors of Prisons in Scotland, 7 and 8 Vict. c. 34, 14 and 15 Vict. c. 27.

HOUSE OF LORDS. See **PARLIAMENT.**

HOUSEBOTE, in English Law, the right which a tenant has to cut wood on the land to repair the house, often called *Estovers*.

HOUSEBREAKING. See **HOUSE.**

HOUSEBURNING, a crime in Scotland, generally called *Arson* in England.

HOUSE-DOVES, in the Law of England, are protected like domesticated animals, and the taking of them is in general larceny; and if the offence of larceny cannot be made out, then a magistrate may inflict a penalty of £2, over and above the value of the bird (24 and 25 Vict. c. 96, s. 23). In Scotland, it is also theft to break into dove-cotes. But there is no summary redress for the lesser offences.

HOUSE-FLY (*Musca domestica*), an insect too well known to need description, and remarkable for its extensive distribution both in the Old and in the New World. It belongs to the vast dipterous family *Muscides*. The maggots live in moist dung,

in heaps of rotting vegetables, &c. When house-flies become annoying, various expedients are resorted to for killing them, as trapping in glasses partially

Various parts of House-*FLY*, highly magnified :

Copied from Samuelson's *Earthworm and Common House-FLY*

a, section of fly, shewing nervous system; b, head of house-fly, shewing the compound eyes, and, beneath, the proboscis; c, last joint of tarsus, or foot of fly, with hooks and pads; d, proboscis of house-fly; e, portion of fringe of the pad, to shew the supposed suckers; f, leg of fly.

filled with some sweet viscid fluid, or by pieces of paper covered with a mixture of sweet and poisonous substances. Sweet substances, however, attract flies into a room, so that the benefit of fly-traps is often doubtful; and care must be taken that the poisons used do not endanger the lives of children or others. Quassia is safe enough in this respect, and very fatal to flies.

In addition to what has been said in the article **DIPTERA** concerning the power which many insects possess of walking on perpendicular walls, ceilings, &c., it may here be mentioned that, according to the observations of Mr Hepworth, who has carefully investigated this subject, although the membranous discs (*pulvilli*) on the foot of a fly are incapable of being used as suckers, yet the hairs with which they are thickly beset, are terminated by minute discs, which probably are so used. At the same time, these minute discs appear to exude a liquid, not viscid, which probably serves to make the adhesion more perfect.

The proboscis of the H. is a very interesting microscopic object. It is chiefly formed by an extraordinary development of the *longuelet* or *ligula*, the upper part of the under lip (*labium*), but with this are combined lancets formed of the metamorphosed *maxillæ*. (For these, see **COLEOPTERA**.) The lobes of the ligula are much enlarged and fleshy. They are surrounded by rough hairs, to aid in scraping or tearing delicate surfaces. There are many rows of these hairs on each lobe. In using its proboscis to feed on dry substances, as sugar, the fly moistens them with a liquid which may be regarded as saliva, so as to fit them for suction action. To aid in this suction action, the muscles of the lobes of the ligula are disposed in a spiral form.

HOUSEHOLD TROOPS are those troops whose especial duty it is to attend the sovereign, and to guard the metropolis. These forces comprise three regiments of cavalry—the 1st and 2d Life-guards, and the Royal Horse-guards, and three

regiments of Foot-guards (which include seven battalions), the Grenadier, Coldstream, and Scots Fusilier Guards. The cost of these corps, for pay and allowances only, reaches the sum of £280,000 a year; and they number in all ranks 1317 cavalry and 6306 infantry, who are justly held to be the flower of the British army.

HOUSE-LEEK (*Sempervivum*), a genus of plants

House-Leek (*Sempervivum tectorum*).

of the natural order *Crassulaceæ*, having a calyx of 6–20 sepals, the petals equal in number to the sepals, and inserted into the base of the calyx; the leaves generally very succulent, and forming close rosettes. The COMMON H., or CYPHEL (*S. tectorum*), called *Fous* or *Fouels* in Scotland, and in some countries *Jupiter's Beard*, grows wild on the rocks of the Alps, but has long been common in almost every part of Europe, planted on walls, roofs of cottages, &c. It sends up leafy flowering stems of 6–12 inches in height, bearing branches of pale-red star-like flowers, equally curious and beautiful. The leaves cut or bruised, and applied to burns, afford immediate relief; as they do also in stings of bees or wasps; and they are a beneficial application to ulcers and inflamed sores. They were formerly in high esteem as a remedy for fevers and other diseases, and an edict of Charlemagne contributed greatly to the extensive distribution of the plant. The edict is in these words: *Et habeat quisque supra domum suam Jovis barbam* (And let everybody have the Jupiter's beard on his house).—Other species possess similar properties. *S. soboliferum*, with yellowish-green flowers, is very frequently planted on walls in Germany. Some of the species, natives of the south of Europe, Canary Isles, &c., are shrubby; others are common green-house plants.

HOUSEMAID'S KNEE is the term commonly applied to an acute inflammation of the bursa or sac that intervenes between the patella, or knee-pan, and the skin. Housemaids are especially liable to it from their kneeling on hard damp stones. It causes considerable pain, swelling, and febrile disturbance. The only disease for which it can be mistaken is acute inflammation of the synovial membrane lining the cavity of the joint; but in this disease, the patella is thrown forwards, and the swelling is at the sides, while in housemaid's knee, the swelling is very superficial, and is in front of the patella.

The treatment consists essentially in the means usually employed to combat inflammation; viz., rest, leeches, fomentations, and purgatives; if suppuration

take place, the sac must be freely opened, and the pus evacuated.

HOUSE-RENTS, in Scotland, when the lease is verbal, prescribe in three years—i.e., no action can be maintained after that time; but in England an action can be brought within six years. See **LANDLORD AND TENANT**.

HOU'SSA, or, according to Dr Barth, **HÁUSA**, a district of Africa, in Sudan, forming a portion of the empire of Sôkoto (q. v.). The name, however, is used to designate rather the race inhabiting the district, and the language which there prevails, than to mark any distinct political division. H. Proper comprises seven states. The country of the H. is very beautiful, and the inhabitants lively, spirited, and industrious.—See Barth's *Travels and Discoveries in North and Central Africa*.

HOUSTON, a city in Texas, United States of America, at the head of steam-boat navigation on Buffalo Bayou, 45 miles from its mouth in Galveston Bay, and 80 miles from Galveston. It has iron foundries, machine-shops, and cotton-presses, and exports cotton, cattle, and agricultural products. Pop. in 1860, 5000.

HOUSTON, SAM, general and ex-president of Texas, was born near Lexington, Rockbridge Co., Virginia, March 2, 1793; enlisted as a common soldier in the war of 1812; was chosen ensign, and fought under Jackson with a courage that won his lasting friendship. In 1823, he was chosen member of congress, and in 1827, governor of Tennessee. In January 1829, he married the daughter of an ex-governor; and in the following April, for reasons never made public, abandoned wife, country, and civilisation, was adopted as a son by the chief of the Cherokee nation, beyond the Mississippi, and was formally admitted as a chief. In 1832, he went to Washington, and procured the removal of several United States Indian agents, on charges of fraud, but got into personal difficulties with their friends. The Texan war offered a new field to his ambition. H. was made commander-in-chief. The Americans at first sustained some severe defeats, and H. was obliged to retreat before the Mexicans under Santa-Anna for nearly 300 miles, but suddenly turning on his pursuers, H. fought the remarkable and decisive battle of San Jacinto, 21st April 1836, at one blow annihilated the Mexican army, and achieved the independence of Texas. The hero of San Jacinto was elected first president of Texas, and re-elected in 1841, and on the annexation of Texas to the United States, in 1845, sent to the national senate, where he remained until 1859, when he retired, and was elected governor of Texas. He opposed secession, but retired to private life when he found that opposition was fruitless.

HOVEN, or distention of the rumen or first stomach with gas, is a common complaint among cattle and sheep, and results from the eating of food to which the animal has been unaccustomed, from wet clover or vetches, or from any easily fermentable food. Relief generally follows walking exercise, friction on the belly, and a dose of any ordinary stimulant, which for a cow may consist of a couple of ounces of turpentine, whisky, ether, or ginger, to which should also be added, in order to clear the bowels of the offending food, a laxative, such as a pint of oil or a pound of salts. A fourth or fifth of these quantities will suffice for sheep. The introduction of the probang, with the small end downwards, allows the escape of gas when there is little food in the stomach. If simple remedies fail, the breathing become distressed, and the animal stupid; the gas may with safety be allowed to escape by an external opening made at a point

intermediate between the last rib, the lumbar vertebra, and the prominence of the haunch, either with a canula and trochar, or a large pocket or table knife. For several days after an attack of hoven, the digestive organs are apt to be easily deranged, and the animal must have soft and digestible food, and an occasional dose of simple laxative medicine.

HOWARD. The noble House of H. has stood for many centuries at the head of the English nobility. The Howards have enjoyed the dukedom of Norfolk since the middle of the 15th c., and have contributed to the annals of the nation several persons of the most distinguished character both in politics and in literature. Neither Sir W. Dugdale, nor Collins, nor Sir Bernard Burke claims for the Howards any more ancient origin than Sir William H., a learned Chief-justice of the Common Pleas under Edward I. and Edward II., though Dugdale incidentally mentions a tradition that their name is of Saxon origin, and derived either from an eminent office under the crown before the Conquest, or from Hereward, the leader of those forces which for a time defended the isle of Ely so valiantly against William the Conqueror. Be this as it may, it is certain that Sir John H., the grandson of the above-mentioned judge, was not only admiral and captain of the king's navy in the north of England, but sheriff of Norfolk, in which county he held extensive property, which was subsequently increased by the marriage of his grandson, Sir Robert, with the co-heiress of the ancient and noble House of Mowbray, Dukes of Norfolk. The only son of this union was Sir John H., one of the leading supporters of the House of York, who, having gained early distinction in the French wars of Henry VI., was constituted by Edward IV. constable of the important castle of Norwich, and sheriff of Norfolk and Suffolk. He subsequently became treasurer of the royal household, obtained 'a grant of the whole benefit that should accrue to the king by coinage of money in the City and Tower of London, and elsewhere in England;' and further, was raised to the peerage as Lord Howard and Duke of Norfolk. We find him in 1470 made captain-general of the king's forces at sea, and he was most strenuous in that capacity in his resistance to the House of Lancaster. Finally, he was created Earl Marshal of England, an honorary distinction still borne by his descendants, and in 1484 was constituted Lord Admiral of England, Ireland, and Aquitaine. He fell next year, however, on Bosworth Field, and, after his death, his honours were attained, as also were those of his son Thomas, who had been created Earl of Surrey. The latter, however, after suffering three years of imprisonment in the Tower of London, obtained a reversal of his own and his father's attainders, and being restored to his honours accordingly, became distinguished as a general, and is more particularly celebrated in history for his defeat of the Scotch at Flodden in 1513. His son Thomas, third Duke of Norfolk, was attainted by Henry VIII., though afterwards restored in blood, and by his marriage with a daughter of King Edward IV., became the father of the ill-fated and accomplished Earl of Surrey, whose execution was the last of the many acts of tyranny which disgrace the memory of Henry VIII. Eminent as a statesman, a warrior, and a poet, Surrey is thus described by Sir Egerton Brydges: 'Excellent in arts and in arms; a man of learning, a genius, and a hero; of a generous temper and a refined mind, he united all the gallantry and unbroken spirit of a rude age with all the elegance and grace of a polished era. With the greatest splendour of descent, in possession of the highest honours and unbounded wealth, he

relaxed not his efforts to deserve distinction by his personal worth. Conspicuous in the rough exercises of tilts and of tournaments, and commanding armies with skill and bravery in expeditions against the Scots under his father, he still found time, at a period when our literature was rude and barbarous, to cultivate his mind with all the exquisite spirit of the choicest models of Greece and Rome, to catch the excellences of the revived muses of Italy, and to produce in his own language compositions which, in simplicity, perspicuity, graceful ornament, and just and natural thought, exhibit a shining contrast to the works of his predecessors, and an example which his successors long attempted in vain to follow.'

The Earl of Surrey was executed during the lifetime of his father, on whom the same sentence had been passed, when the death of the royal tyrant saved him from the block. His grandson, Thomas, fourth Duke of Norfolk, in like manner suffered attainder, and was executed on Tower Hill for high treason, for his communication with Mary, Queen of Scots. The family honours, however, were again restored, partly by James I., to his grandson, and partly by Charles II. to his great-great-grandson, Thomas, who thus became eighth duke, and whose cousin and successor, Charles, ninth duke, was the direct ancestor of the present Duke of Norfolk.

It would be impossible here to give a list of all the honours which from time to time have been conferred on various branches of the ducal House of H.; it is sufficient to say, that in one or other of their widespread branches, the Howards either have enjoyed within the last three centuries, or still enjoy, the earldoms of Carlisle, Suffolk, Berkshire, Northampton, Arundel, Wicklow, Norwich, and Effingham, and the baronies of Bindon, Howard de Walden, Howard of Castle Rising, and Howard of Effingham.

It will be seen from the above remarks, that the ducal House of Norfolk is one whose fate it has been, beyond all others among the English nobility, to find its name interwoven with the thread of English history, and not rarely in colours of blood. The accomplished but unfortunate Surrey, and his scarcely less unhappy father, Thomas H.—whose head was only saved from the block on which his son so nobly suffered by the death of the eighth Henry—are 'household words' in the pages of English history; and readers of Shakspeare will have other recollections of the same name allied with other historical events; while those who are familiar with the writings of Pope, will not have forgotten how tersely and pointedly he typifies the glory of ancestral pedigrees by

'All the blood of all the Howards.'

Other members of the House of H. have gained a place in the pages of English history. Sir Edward H., K.G., brother of the first Earl of Surrey, was made by Henry VIII. the king's standard-bearer and admiral of the fleet, in which capacity he lost his life in boarding a French vessel off Brest in action in 1513; his brother, Sir Edmund, acted as marshal of the horse at Flodden; and his half-brother, Sir Thomas H., was attainted, and died a prisoner in the Tower, for aspiring to the hand of the Lady Margaret Douglas, daughter of Margaret Queen of Scotland, and niece of Henry VIII., one of whose ill-fated consorts was the Lady Catharine Howard.

HOWARD, JOHN, 'the philanthropist,' was born at Hackney, near London, about 1726. From his father, who had been engaged in trade, H. inherited a considerable fortune. In 1756, the year of the

great earthquake at Lisbon, urged by motives of benevolence, as well as of curiosity, he set sail for that city. On this voyage his vessel was taken by a French privateer, and he was carried into the interior, when he suffered imprisonment for some time. The hardships which he here underwent, combined with the knowledge of prisons and the miseries of prison-life which he acquired as a county sheriff in 1773 and afterwards, determined him in devoting himself to prison reform. His life hereafter is but a chronicle of his journeys throughout the United Kingdom and the continent, in which he visited the principal prisons and hospitals. His chief work is *An Account of the Lazarettos in Europe, &c., with Remarks on the Present State of the Prisons in Great Britain and Ireland* (1789). He died January 20, 1790, at Kherson, in the south of Russia, from having caught infection from a fevered patient for whom he had prescribed. The fame of H. is peculiar. He is remembered not so much for his talents as for that devotion to his suffering fellow-men, in which he expended his fortune and his life.

HOWE, EARL (RICHARD HOWE), British admiral, was the second son of Emanuel Scrope, second Viscount Howe of the Irish peerage. He was born in 1725, and educated at Eton. Having a boyish passion for the sea, he left Eton at 14, and went to the South Seas in the squadron under Anson. He was with Admiral Vernon in 1745, and at the time of the Scottish rebellion, being in command of the *Baltimore* sloop, took part in the siege of Fort William. He also, with another vessel, beat off two French ships conveying troops and ammunition to the Pretender, for which he was made post-captain. In 1755, his ship, the *Dunkirk*, captured the *Alcide*, a French 64, off Newfoundland. He next served under Sir E. Hawke in the expedition against Rochefort. He was ordered to attack the fort on the isle of Aix with his ship the *Magnanime*, compelled it to surrender after an hour's cannonade, and achieved the only material success which attended the expedition. He was commodore of the squadron which sailed in 1758 for St Malo. The troops were landed and re-embarked without loss, after destroying all the magazines and shipping in the port, to the number of 120 sail. In the same year he took Cherbourg. Nearly 200 pieces of iron cannon and mortars were here rendered unserviceable; the brass cannon were brought to England; the celebrated basin was destroyed, and 27 ships and vessels were burned or sunk. A second attack upon St Malo was less successful. The French troops assembled in force at the Bay of St Cas, and it was only by the intrepidity of H., who went in his own barge into the centre of the enemy's fire, that the re-embarkation of the rear-guard was effected, with great loss of life. In 1758, he succeeded to the Irish title of viscount on the death of his brother, the brigadier-general, who was killed before Ticonderago. He took part in the defeat of the fleet under the Marquis de Conflans, and captured the *Hero*, 74 guns. In 1760, he was made colonel of the Chatham division of marines, and afterwards a Lord of the Admiralty, and Treasurer of the Navy. In 1776, he commanded a fleet on the American coast, when the conquest of New York, Rhode Island, Philadelphia, and every settlement within the reach of a naval force, testified to his skill and energy. In 1778, he defended the American coast against a superior naval force under D'Estaing. He was made a viscount of Great Britain in 1782, and sent out with a fleet to relieve Gibraltar. He succeeded in disembarking troops, ammunition, and supplies, and then offered battle to the combined fleets of France and Spain, which declined an

engagement. He was made First Lord of the Admiralty in 1783, and received an English earldom in 1788. When war with France broke out in 1793, he took the command of the Channel fleet, and next year gained the victory which will long be known as that of 'the glorious first of June.' The French fleet consisted of 26 ships of the line, and the English of 25. H., in his flag-ship, the *Queen Charlotte*, engaged in the Bay of Biscay, off Ushant, the French admiral, who in less than an hour crowded all the sail he could carry, followed by as many of his ships as could get away. The English captured two ships of eighty guns, and four seventy-fours; another seventy-four sank immediately after she was taken possession of. London was illuminated three nights in honour of the victory. The thanks of parliament were voted to Howe. George III. visited him on board the *Queen Charlotte*, gave him a sword, and made him a Knight of the Garter. His last service was in bringing back the mutinous seamen at Portsmouth to their duty in 1797. He died August 5, 1799, aged 74, leaving a name high in the rôle of English naval worthies.

HOWE, JOHN, who has been called the *Platonic Puritan*, was born 17th May 1630, at Loughborough, in Leicestershire, to the living of which parish his father had been presented by Laud. He studied both at Cambridge and Oxford, and after preaching for some time at Winwick, in Lancashire, and Great Torrington, in Devonshire, he was appointed domestic chaplain to Cromwell in 1656, in which difficult situation his conduct was such as to win praise even from the enemies of his party. At the Restoration, he returned to Torrington, where the position he had held during the Commonwealth made him an object of close suspicion to the government. The *Act of Uniformity*, however, ejected him from his parish, 24th August 1662, and he wandered about preaching in secret till 1671, when he was invited by Lord Massarene, of Antrim Castle, in Ireland, to become his domestic chaplain. Enjoying there the friendship of the bishop of that diocese, and liberty to preach in all the churches under his jurisdiction, he wrote his *Vanity of Man as Mortal*, and began his greatest work, *The Good Man the Living Temple of God* (1676—1702), which occupies one of the highest places in Puritan theology. In 1675, he was called to be pastor of the dissenting congregation in Silver Street, London, and went thither in the beginning of 1676. In 1677 he published, at the request of Mr Boyle, *The Reconcilableness of God's Prescience of the Sins of Men with the Wisdom of His Counsels and Exhortations*; in 1681, *Thoughtfulness for the Morrow*; in 1682, *Self-dedication*; in 1683, *Union among Protestants*; and in 1684, *The Redeemer's Tears wept over Lost Souls*. In 1685, he was invited by Lord Wharton to travel with him on the continent; and after visiting the principal cities, he resolved, owing to the state of England, to settle for a time at Utrecht, where he was admitted to several interviews with the Prince of Orange. In 1687, the *Declaration for Liberty of Conscience* induced him to return to England, and at the Revolution next year he headed the deputation of dissenting clergymen when they brought their address to the throne. Besides smaller works, he published, in 1693, *Carnality of Religious Contention*; in 1694—1695, several treatises on the Trinity; in 1699, *The Redeemer's Dominion over the Invisible World*; and he continued writing till 1705, when he published *Patience in Expectation of Future Blessedness*. He died 2d April 1706.—See Henry Rogers's *Life and Character of John Howe, with an Analysis of his Writings*.

HOWE, SAMUEL GRIDLEY, M.D., an American

physician, was born at Boston, November 10, 1801, and educated at the Boston Latin School, and Brown University, where he graduated in 1821. He then studied medicine. Being an admirer of Lord Byron, he wished to join him in aiding the Greek revolution, and embarked from Boston for Greece in 1824; volunteered as a surgeon; served two years as a guerrilla; organised the medical staff of the Greek army, and was appointed its chief. The Greeks were suffering for supplies, and even for food; and he went to America, and raised large contributions. Returning with food, clothing, and supplies, he formed the colony of Corinth, in which he filled all offices, from governor to constable. Taken down with the swamp-fever in 1830, he went to Paris, where he attended medical lectures, and in 1832 returned to the United States. Having become interested in the education of the blind, he was sent to Europe, to examine the best institutions, but volunteered in the Polish insurrection, and spent six weeks in a Prussian prison. On his return, the Massachusetts Institution for the Blind was established, and placed under his management, which he has ever since retained. He has also established a school for idiots, and in 1828 published a *Historical Sketch of the Greek Revolution*.

HOWITT, WILLIAM AND MARY, two English authors that may most properly be treated together. William H. was born in 1795 at Heanor, in Derbyshire, and was educated at various schools in connection with the Society of Friends, to which persuasion his family belonged. In his youth, he was fond of outdoor sports, and he celebrated in verse the scenery with which he was familiar. In 1823, he married Miss Mary Botham, a lady of literary taste and acquirements, and whose family, like his own, was attached to the principles of Quakerism. *The Forest Minstrel*, with their joint names on the title-page, was published during the year in which they were married. For three or four years thereafter, they employed themselves in contributions to annuals and magazines, and in 1827 a selection from these fugitive pieces appeared under the title of *The Desolation of Eyam*. From this date up till 1837, William H. wrote *The Book of the Seasons*, *Popular History of Priestcraft*, and *Tales of the Pantika*. During the same period, Mary H. produced *The Seven Temptations*, and a country novel entitled *Wood-Leighton*. In 1837, William and Mary H. removed to Esher, in Surrey, and at that place William H. wrote *Rural Life in England*, *Colonisation and Christianity*, *Boy's Country Book*, and *Visits to Remarkable Places*, first series. Mary H. at the same time employed herself in writing *Tales for Children*, many of which are popular. In 1840, William H., with his wife and family, removed to Heidelberg, where they resided two years. The influence of this residence has been visible on both. Attracted by the richness of Scandinavian literature, Mary H. made herself mistress of the northern languages, and translated the works of Miss Bremer and Hans C. Andersen. These translations appeared between 1844 and 1852. William H. was also busy during the same period. He wrote and translated novels; he published a political work, entitled *The Aristocracy of England*; and he gave to the world, in two volumes, *The Homes and Haunts of the British Poets*, one of the most pleasing and popular of his works. In 1852, he went to Australia, where he remained two years, writing during his stay *A Boy's Adventures in the Wilds of Australia*; and since his return he has published a work, in two volumes, entitled *Law, Labour, and Gold*, or *Two Years in Victoria, with Visits to Sydney and Van Diemen's Land*.

HOWITZERS are guns which came into use early in the history of field-artillery, as portable instruments for discharging shell into a hostile force. As, for this purpose, no great range was necessary, a small charge of powder sufficed; and the howitzer could be made, in proportion to its large bore, extremely light. It combines in some degree the accuracy of a cannon with the calibre of a mortar; and while equally effective at short ranges, is far more portable than either. That the powder, on its expansion, may act with full force on the shell, it is confined in a hemispherical chamber of smaller diameter than the rest of the bore, the mouth of which is completely closed by the shell when rammed home. The Coehorn howitzer, much used in India for mountain-service, is a small gun, light enough to be borne by a horse up hilly defiles, &c.

HOWLER, HOWLING MONKEY, or STENTOR (*Myctes*), *Alouatte* of the French, a genus of American monkeys, remarkable for the dilatation of the Hyoid (q. v.) bone into a hollow drum, which communicates with the larynx, makes a conspicuous external swelling of the throat, and gives prodigious power to the voice, enabling these animals to emit hideous sounds, which are heard miles away, and to which all their names refer. They live chiefly among the branches of trees, and take extraordinary leaps from one to another, taking hold by the tail as readily as by the hands, and often swinging by it alone. They are gregarious, and unite their voices in concert, so as to produce a most deafening noise. The monkeys of this genus are regarded as in their low intelligence and their fierceness of disposition American representatives of the baboons, whilst in many of their habits they more nearly accord with the gibbons of the

Howling Monkey (*Myctes ursinus*).

Old World. They inhabit the north-eastern parts of South America. They are the largest monkeys in the New World. There are not many species.

HOWTH, a small peninsula on the east coast of Ireland, forms the north shore of the Bay of Dublin, and is two and a half miles long by about two miles broad, with an area of about 2600 acres. H. is connected with the mainland by a low and narrow isthmus, and its insular appearance greatly enhances the picturesque effect of Dublin Bay.

HOY, a small vessel differing little, if at all, from the sloop or smack. Its ordinary employment is in carrying goods or passengers coastwise from one place to another, and particularly in inlets, &c.,

where longer lighters and other vessels could manœuvre only with difficulty.

HOY, one of the Orkney Islands, lies south-west from Pomona, or the Mainland, from which it is separated by a passage about 2 miles in width. It is 14 miles long, and 6 miles broad, and has a population in all of about 324. Unlike the most of the islands of its group, Hoy rises abruptly from the sea, with precipitous cliffs 1000 feet in height fronting the west; the highest eminence, Wart Hill, is 1555 feet above sea-level. It has in the south the harbour of Long Hope, said to be the finest in the Orkneys, and defended by a fort and two martello towers. Among the curiosities of the island are the Dwarfie Stone, a block of sandstone, 22 feet long, 17 feet broad, and 7 feet high. One end of it has been hollowed out by iron tools, the marks of which are still visible, and a kind of apartment formed. In the south-west of the island is the Old Man of Hoy, a pillar of rock 300 feet in height.

HOYA, a genus of tropical plants of the order *Asclepiadaceæ*, having a 5-cleft wheel-shaped corolla, and a 5-leaved spreading fleshy corona. Some of the species are common in hothouses, and from the appearance of their flowers, they are called *Wax-plants*.

HUAHEINÉ, the most easterly of the Society Islands (q. v.).

HUALLA'GA, a river of Peru, rises on the east side of the Andes, near lat. 11° S., at an elevation of 13,200 feet above the sea. After a northerly course of about 500 miles, during which it presents many considerable falls, it enters the Amazon.

HUAMA'NGA, a city of Peru, in the department of Ayacucho, stands on an affluent of the Apurimac. It was founded by Pizarro in 1539, on the route between the old and new capitals of the country, Cuzco and Lima. It has a population of about 15,000, with a cathedral and a university. Near H., in 1824, was completed the independence of Spanish America, by the decisive victory of General Sucre.

HUA'NACA, or **GUANACO** (*Auchenia Huana*; see *AUCHENIA*), a species of the same genus with the llama and alpaca, of both of which some naturalists suppose it to be the wild original. It is found not only on the Andes, but throughout great part of Patagonia. It is of a reddish-brown colour, the ears and hind-legs gray. It generally lives in herds of ten to forty, and is very quick-sighted and wary; although such is the strength of its curiosity, that hunters attract the herds within easy reach of their rifles by lying down on the ground, and kicking their feet in the air. Like its congeners, the H. is extremely sure-footed on rocky ground.

HUANCAVELICA, a town of Peru, about 80 miles to the west-north-west of Huamanga, stands, at an elevation of 11,000 feet above the sea, on the east declivity of the Andes. Its inhabitants, said to be about 8000 in number, are chiefly engaged in the working of the neighbouring mines of gold, silver, and quicksilver.

HUANUCO, a town of Peru, on an affluent of the Huallaga (q. v.), which bears its own name, is situated on the east declivity of the Andes, at a distance of 180 miles to the north-north-east of Lima. It contains 4500 inhabitants, and is one of the most ancient places in the country.

HUARA'Z, or **HUARAS**, a small town of Peru, situated in a valley of the Andes, on the right bank of the river Santa, 150 miles south-east of the seaport of Truxillo. Pop. 5000.

HUBER, FRANÇOIS, a Swiss naturalist, was born at Geneva, July 2, 1750. At an early age he lost his eyesight, and some years after this, married a Mademoiselle Lullin, by whose assistance, and that of an intelligent domestic, named Burnens, he made a vast variety of original and important observations on the habits of bees, which did much to correct the errors and imperfections of previous writers. H.'s first work was entitled *Lettres à Ch. Bonnet* (1792). It was reprinted in 1796, and again in 1814, under the title of *Nouvelles Observations sur les Abeilles*. In his latter years, H. derived important aid in his studies from his son Pierre (born 1777, died 1840), the author of a valuable treatise on the *Habits of Ants*, and of several able memoirs relating to Zoology and Meteorology, which are to be found in the Mem. Soc. Genève, between the years 1821 and 1830. H. died at Lausanne, 21st December 1831.

HÜBNER, RUD. JUL. BENNO, one of the most eminent painters of the modern German school, was born at Oels, in Silesia, in 1806, and first attracted attention by his picture of 'Ruth and Boaz.' In 1839, he settled at Dresden, where he has been a professor since 1841. His principal productions are—'Samson overthrowing the Pillars of the Temple,' 'The Departure of Naomi,' 'Christ and the Evangelists,' 'Job and his Friends,' 'The Lovers of the Canticles,' 'Happiness and Sleep,' 'Christ in the midst of the People,' 'The Fisherman' (from the ballad of Goethe), and 'The Golden Age.' H. belongs, as the character of his works shews, to the great historic and religious school of German art, whose principal seat is Düsseldorf.

HUC, EVARISTE REGIS, a distinguished missionary and traveller, was born at Toulouse, August 1, 1813. He was educated in his native city, and about his 24th year he entered the missionary congregation of the Lazarist Fathers, and received holy orders at Paris in the year 1839. Almost immediately after his ordination, he joined the missionary expedition of his order to China. After he had spent about three years of missionary life in the northern districts of China, the new apostolic vicariate of Mongolia was founded, and H., in company with a priest of the same congregation, Père Gabet, and a single native Chinese convert, undertook to explore the new district, and to ascertain, for the guidance of the mission, its extent and its missionary capabilities. After a few months' study of the Tartar dialects, they set out from the missionary station, north of the Great Wall, called Si-wang, towards the close of 1844; and after a journey of excessive hardship over the high tablelands of Tartary, they took up their quarters for some months in one of the Lamaseries, or Tartar monasteries. Having here become familiarised in some degree with the Tibetan language, they succeeded in making their way, in January 1846, to H'lassa, the capital of Tibet, and the residence of the Grand Lama; but scarcely had they settled in that city, when an order for their immediate expulsion from the country was obtained from the Lama by the Chinese resident in H'lassa. They were not permitted to choose their own route homewards, but having been put in charge of a Chinese escort, were carried back a journey of nearly 2000 miles to the extreme south, and arrived in October 1846 at Macao, where they were subjected to a tedious trial by the Chinese tribunals. In the end, they were permitted to return to the missionary station of Si-wang, from which they had originally taken their departure. H.'s health having been completely broken down, he sailed from Macao in the beginning of January 1849, and in the autumn of

the same year reached his native city of Toulouse. In the following year he returned to Paris, where he published *Souvenirs d'un Voyage dans la Tartarie, le Thibet, et la Chine pendant les Années 1844—1846* (2 vols. Paris, 1852). This was followed, in 1854, by a similar record of his Chinese experience (*L'Empire Chinois*, 2 vols. 3d edit. 1857); and in 1857 by an elaborate historical work on Christianity in China (*Le Christianisme en Chine*). All these works have been translated into English and most other European languages. The strangeness of some of the incidents recorded in the book on Tibet provoked some degree of incredulity in certain quarters; but Captain Blakiston, the latest traveller in the same regions, which have hitherto been almost a *terra incognita* for Europeans, bears unhesitating testimony to the fidelity of Père Huc's narrative and description.

During his latter years, Père Huc, in order to devote himself more freely to his literary occupations, withdrew from the Lazarist congregation. His health, however, never fully recovered from the fatigues of his Tibetan expedition, and he died in Paris March 31, 1860, at the early age of 46.

HUCKABACK, a very coarse kind of linen-cloth, figured somewhat like damask; it is usually employed for common towelling.

HUDDERSFIELD, a parliamentary borough and important manufacturing and market town of England, in the West Riding of Yorkshire, is situated in the midst of a fertile district, on an acclivity rising from the left bank of the Colne, 16 miles south-west of Leeds, and about 25 miles north-east of Manchester. It is remarkably regular, is well built and drained, and very healthy. Upon the Holme and the Colne, which unite in the town, numerous mills have been erected for the manufacture of woollen fabrics, and for fulling and washing the goods manufactured. H. stands in the centre of a district rich in coal, and its natural advantages are enhanced through its direct connection with the principal seats of manufacture in the north of England, by means of the London and North-Western, Lancashire and Yorkshire, and Manchester, Sheffield, and Lincolnshire railways. Among its churches, several are noteworthy in an architectural view. It has a proprietary college, now in connection with the London University; a collegiate school, and many other educational institutions; a circular cloth-hall, 2640 feet in circumference, attended by upwards of 600 cloth-merchants each market-day (Tuesday and Friday); an infirmary; and in the vicinity the Lockwood Spa Baths, where the water is strongly sulphureous. H. is the chief seat in the north of England of what is called the 'fancy trade,' comprising shawls, waistcoatings, flushings, &c., of the most elegant patterns and the finest fabric; it also carries on extensive manufactures of narrow and broad woollen fabrics, kerseymeres, serges, and cords. It is connected by canals with the Mersey and the Humber. The parliamentary borough sends one member to the House of Commons. Pop. (1861) 34,874. (1871—74,358.)

HUDSON, GEORGE, English railway director and speculator, was born in 1800, and apprenticed to a linen-draper in the city of York, where he subsequently carried on business for himself. He took an early share in railway speculation, and was appointed chairman of the North Midland Company. His plans of management were carried out, schemes of railway annexation and extension were undertaken, embarrassed lines were relieved, and rivals were subdued. He was elevated into the dictatorship of railway speculation; everything he touched turned into gold; and H. was everywhere known as

'the Railway King.' The shares of the lines with which he consented to become connected went up, and he was said to have made £100,000 in one day. He bought large estates; was three times elected lord mayor of York; was sent to parliament by the electors of Sunderland; and found his acquaintance courted by persons of the highest rank. When the railway mania was at its height, a statue to H. was proposed; and names were put down for £25,000; but before the money could be collected, the popularity of the 'Railway King' was on the wane. His connection with the Eastern Counties Railway led to some exposures. The accounts had been 'cooked'; matters had been 'made pleasant'; and dividends had been paid out of capital. Suspicions were excited in regard to his direction of other companies, shares fell, the bubble burst, the railway monarch was deposed, and encountered nothing but invective from quarters which had pursued him with adulation. Every board-room was closed against him, and his suddenly acquired gains were almost swept away. The constituency of Sunderland, however, continued to elect him as their representative until March 1859. He has since resided abroad, in comparatively narrow circumstances.

HUDSON, HENRY, a distinguished navigator. His early history is unknown. He undertook his first voyage for the discovery of a north-east passage in 1607, in a small vessel with ten sailors, but failed in this attempt. In his second voyage in 1608, he reached Nova Zembla. He undertook a third voyage in 1609 from Amsterdam, at the expense of the Dutch East India Company. Giving up all hope of finding a north-east passage, he sailed for Davis' Strait, but came upon the American continent about 44° N. lat., and, steering southwards, discovered the mouth of the river which now bears his name. He sailed upon his last voyage in April 1610, with 23 sailors, and reached Greenland in June. Steering westward, he discovered the strait now known as Hudson's Strait, and passed through it, and entered the great bay, which has received the name of Hudson's Bay. Although very insufficiently supplied with provisions, he adopted the resolution of wintering in these desolate regions, in order to prosecute his discoveries further in the following spring. He proceeded to carry this design into execution, but his provisions became so much exhausted, that he was under the necessity of returning. An incautious utterance of his opinion, that in the destitute condition to which he was reduced, he would be obliged to leave some of his people behind, led to his death. The sailors mutinied, and placed him, with his son and some others who adhered to him, in a small boat, at the mercy of the waves and of the savages. His fate was revealed by one of the conspirators. An expedition was sent from England in quest of him, but no trace of him or of his companions in misfortune was ever discovered.

HUDSON, SIR JAMES, K.C.B., diplomatist, is the son of a Yorkshire gentleman, and was born in London in 1810. He was educated at Rugby and Westminster, and subsequently studied at Paris and Rome. He was made private secretary to William IV.; and after the king's death, entered the diplomatic service, and became Secretary of Legation at Washington in 1838, at the Hague in 1843, and at Rio de Janeiro in 1845. In 1850, he was appointed minister at Rio, but was transferred to Florence in 1851, and to Turin, January 1852. His counsels exercised great influence over the Sardinian government; and the conclusion of a commercial treaty between that country and England, the accession of Sardinia to the treaty of alliance

between England and France against Russia, and the despatch of a Sardinian army to the Crimea, were services which procured for him the dignity of K. C. B. The long train of stirring events that resulted in the united and independent kingdom of Italy, demanded the watchful vigilance, and sometimes the active interference, of the British minister (now ambassador) at the court of Turin. H. has never forgotten that he is the minister and representative of a constitutional government, which sympathises with the aspirations of the Italians for national independence, and which has therefore the privilege to warn and counsel as well as to animate. His diplomatic course has not escaped the animadversion of the partisans of things as they were; but it has commanded the approbation of the vast majority of his countrymen.

HUDSON, a city of New York, United States, America, on the east bank of the Hudson river, at the head of ship navigation, 116 miles north of New York, and 29 miles south of Albany. It is a beautifully situated and well-built city, is a port of entry, and formerly had a large amount of shipping engaged in foreign trade and the whale-fisheries. It is now chiefly engaged in manufactures of iron and clothing, and in the export of agricultural staples. It has a fine court-house, eleven churches, public library, orphan asylum, and three newspaper-offices. Pop. in 1860, 7262.

HUDSON, a river in New York, United States, America, and one of the most beautiful and important in America. It rises in the Adirondac mountains, 4000 feet above the level of the sea, and its head-streams are the outlets of many mountain lakes, in the north-eastern portion of the state. At Glenn's Falls, it has a fall of 50 feet, and soon after, taking a southerly course, runs nearly in a straight line to its mouth, at New York city. At Troy, 151 miles from its mouth, it is affected by the tide, and becomes a broad deep river, having a width of from 300 to 700 yards, and deep enough for the largest river steam-boats, and for ships to Hudson, 116 miles. At Newburg, 61 miles from New York, the river enters the highlands, which rise abruptly from the water to the height of 1200—1600 feet. Here the scenery is of great beauty and grandeur, and is admired by all travellers. Several of the heights are crowned with the ruins of fortifications, built to prevent the passage of British ships in the War of Independence. Here was the scene of Arnold's treason, and the sad fate of Major André. Emerging from the highlands, the river widens into a broad expanse called the Tappan Zee. Below, on the west bank, on the New Jersey shore, rises an almost straight and perpendicular wall of trap rock, from the river's brink, to a height of 300 to 500 feet, called the Palisades, extending 15 miles to the upper portion of the city of New York. The river is here from one to two miles wide, and here it falls into New York Bay. Its whole length is about 300 miles, and its principal tributaries are the Hoosic, Mohawk, Walkill, and Croton. The steam-boats which ply on the H. are among the finest and fastest in the world. Some are more than 400 feet long, are fitted up with great luxury, and attain a speed of 23 to 24 miles an hour. The Hudson River Railway runs along the margin of the river on the east bank, to Albany. By this river, and the Erie Canal, and several railways, New York is connected with the great lakes and the west. The river is named from the English navigator who discovered it, 1609. The first successful experiment in steam-boat navigation was made on this river by Robert Fulton in 1807.

HUDSON'S BAY, a spacious gulf in the north-east section of the American continent, may be regarded as an arm at once of the Arctic Sea and of the Atlantic Ocean. With the Atlantic Ocean it communicates by means of a strait, which, besides being solidly bridged for about ten months of the year, is beset, even during its brief period of navigation, by detached floes and bergs of ice. The eastern portion of this outlet is broken up into two branches, offsets of Davis' Strait, the more northerly bearing the name of Frobisher, and the more southerly that of Hudson. It is fully 400 miles long, and averages at least 100 miles in width. With the Arctic Sea, again, H. B. is connected by channels, which, notwithstanding the comparative lowness of their latitude, have proved far less practicable than the Arctic Sea itself, never having been navigated throughout; but it is only within these twenty-five years that this hopeless result has been definitively accepted by the world.

H. B., taken in its narrowest sense, extends in N. lat. from 51° to $62\frac{1}{2}^{\circ}$, and in W. long. from $76\frac{1}{2}^{\circ}$ to 95° . When compared with the corresponding regions on the eastern side of the Atlantic, the shores of H. B. possess a singularly inhospitable climate. At York Factory, lying nearly in the latitude of Aberdeen, the finest weather of summer is liable to a wintry temperature through a mere change of wind; and the most southerly extremity of the gulf is beset for months by snow at the very season when the Faroe Islands, stretching as far north as the parallel of its opposite end, yield available pasture to sheep and cattle.

Though H. B. is not particularly remarkable for the extent of its drainage, yet towards the south and west its basin meets at once the waters of the St Lawrence, the Mississippi, the Columbia, and the Mackenzie. Its largest feeder, the Nelson, fills perhaps a full half of the area, touching the Rocky Mountains on the west, embracing Rainy Lake on the east, and considerably overlapping the international boundary on the south.

HUDSON'S BAY COMPANY, a corporation erected, in 1670, by Charles II., primarily consisted of Prince Rupert, the king's cousin, and certain specified associates. It was invested with the absolute proprietorship, subordinate sovereignty, and exclusive traffic of an undefined territory, which, under the name of Rupert's Land, comprised all the regions discovered, or to be discovered, within the entrance of Hudson's Strait. Rupert's Land was decidedly the most extensive of the dependencies of England, being held to embrace all the lands that poured water into Hudson's Bay or Hudson's Strait. For more than a century, however, the grantees confined themselves to the coast. About the period of the formation of the American republic, their advance into the interior was accelerated, if not occasioned, by the more mature development of an ancient rivalry. From about the middle of the 17th c.—an epoch antecedent to the charter—New France, besides stretching, in name, to the arctic circle, had, in reality, advanced to the shores of Hudson's Bay; and this position of affairs was virtually recognised by that provision of the letters-patent, which exempted from their operation any actual possessions of any Christian prince or state. Though the claims of France, after being confirmed in 1697 by the treaty of Ryswick, were at last abandoned in 1713 by the treaty of Utrecht, yet, in point of fact, adventurers from the great lakes, while Canada was still French, had penetrated, in quest of peltry, far up the Saskatchewan towards the Rocky Mountains. Such overland enterprises—interrupted, for a few years, by the conquest and cession of 1759—1763

—soon came to be prosecuted, with more systematic energy, under English auspices, till, in 1783, they led to the formation of the North-west Company of Montreal. After an age of stubborn competition, the Hudson's Bay Company coalesced, in 1821, with its formidable opponent.

But the two members of the new partnership had already almost doubled the original field of contention. The older association had, about 1770, traversed the basin of the Coppermine; and, fully twenty years later, the younger one had descended the Mackenzie to the Arctic Sea, and had, through the barrier of the Rocky Mountains, reached the Pacific Ocean. Even in general equity, a body, which now represented all the discoverers, had a peculiar right to the discoveries themselves; but beyond general equity, a secondary provision of the letters-patent of Charles II. had regarded such discoveries, at least for the purposes of trade, as accretions to the primary grant. Accordingly, when, in 1821, parliament, in view of the intolerable evils of competition, empowered the crown to issue licences for the 'Indian Territories'—expressly declared to be all the wildernesses of British North America to the west of Rupert's Land—the government exercised this statutory authority in favour of the Hudson's Bay Company, as recast and extended by the coalition. So far as commerce was concerned, there was now no practical difference between Rupert's Land and the Indian Territories, excepting that the charter of the former was perpetual, and the licence of the latter was to be for 20 years at a time; and thus the newly-modified association virtually ruled the western world, through 75° of long., from Davis' Strait to Mount St Elias, and, through 28° of lat., from the mouth of the Mackenzie to the borders of California.

But these dominions, second, in point of superfluities, to Russia alone among the compact organisations of the world, were gradually diminished. About twenty years after the coalition, Oregon from the borders of California to the parallel of 49° N., which had always been open to Americans by international arrangement, was given up to the United States by the same treaty which sacrificed sections of Canada and New Brunswick; in 1859, the rest of the tramontane tract was brought within the pale of civilisation as the national colonies of Vancouver's Island and British Columbia; and lastly, as the second term of the licence was, in 1859, also permitted to expire without renewal, the remainder of the 'Indian Territories' was then potentially thrown back into the condition from which the statute of 1821 had seen fit to rescue it.—In all these cases, excepting, of course, the case of Oregon, the Hudson's Bay Company would appear to have lost rather formal privilege than actual influence, retaining, if not a legal monopoly as of old, at least a commercial supremacy on a wider basis.

Though the withholding of the licence neither affected, nor professed to affect Rupert's Land, yet between it and the remaining portion of the Indian Territories the difference, so far as Hudson's Bay Company is concerned, is little more than nominal. This result must, to some extent, be regarded as a natural fruit of human progress; free trade and free colonisation having become part and parcel of our national policy. But one may reasonably doubt how far the virtual abolition of the charter promises to be advantageous. So far as the Indians are concerned, the question is hardly open to discussion. With regard to them, competition, after long and decisive experience, has been already condemned by the supreme legislature of the empire. The opposite system, on the other hand, may, in this respect, boldly challenge comparison with the practice of

any other portion of North America. Within this range, it may exclusively boast of having neither extirpated nor expatriated the native tribes. Nay, far beyond this negative merit, it has achieved, what has never been elsewhere successfully attempted—the elevation of the descendants of mixed blood as the equals of their white brethren, to the highest degree of civilisation that exists in the country. With regard, again, to others than the aborigines, competition may not fully realise the expectations either of speculators themselves or of their emissaries. While the latter must gradually lose all relish for any more steady pursuit, the former, by operating as much against each other as against the Hudson's Bay Company, must at once fritter away the amount of business, and reduce the rate of profit, besides being tempted by the absence of all permanent interest in the matter to exhaust alike the hunter and his game for the sake of present returns; to kill, in a word, the hen that lays the golden eggs. Nor with regard to colonisation does experience lead to much hope of success. Hitherto most of the settlers are either retired servants of the Hudson's Bay Company or their offspring. In very few instances, if in any, have agricultural immigrants gone to Rupert's Land at their own expense; and of the successive bands that have been sent thither by others, such as Lord Selkirk, and the Hudson's Bay Company, and the British government, a very scanty proportion have remained, and those, too, almost constantly on the wing for the south.

Under the deed of Charles II., the Hudson's Bay Company possesses certain powers, now practically obsolete, beyond the limits of Rupert's Land, being invested with a jurisdiction over its own servants, whether in the adjacent wildernesses or on the high seas, and being entitled to make war on any non-Christian prince or people. Its internal constitution, as regulated by the letters-patent, is peculiar in this respect, that without any such graduated restrictions as generally affect similar associations, the influence of a proprietor is precisely proportioned to his number of shares—one vote being attached to every £100 sterling of stock. Further, the body at large is required to act at home through a governor and committee, and abroad through a governor and council. As to actual organisation, the local ruler's advisers are mostly such mercantile officers as are above the rank of clerk. These mercantile officers, hence loosely distinguished as wintering partners, receive among them two-fifths of the net profits of the concern, a chief factor getting two, and a chief trader one of the eighty-five parts, into which the allotment in question is divided. As a single part, between one year and another, ranges from about £300 to about £500, the total revenue may easily be found to vary from about £63,750 to about £106,250—averaging perhaps about £80,000, so as to yield about £48,000 to the proprietors, and about £32,000 to the wintering partners. This income arises almost entirely from furs; for other articles, such as tallow, oil, feathers, fish, timber, &c., have never been of much account. As nearly all the skins are shipped from Rupert's Land, fuller details on the subject will be given in connection with that country and its two ports, Moose Factory and York Factory. See also INDIAN TERRITORIES, RED RIVER SETTLEMENT, and VANCOUVER'S ISLAND.

The Hudson's Bay Company naturally excites a retrospective interest, as the last of the great associations that have figured so largely, and, in general, so creditably, in the colonial and commercial annals of England.

For further particulars, see *Fitzgerald's Examination*

of the *Charter and Proceedings of the Hudson's Bay Company*, and Montgomery Martin's *Hudson's Bay Company's Territories, and Vancouver's Island*, both published in 1849—perhaps the leading works on opposite sides of a much vexed controversy.

HUE, the capital of Cochin China, or, more properly speaking, Annam, in the gulf of Tonquin, in the prefecture of Thua Thuan, 16° 30' N. lat., 107° 12' E. long., 10 miles from the mouth of the Hue River. It is built almost in the European style. Under the reign of King Cia-lung (1801—1820), it was strongly fortified by French officers, to whom, with a French bishop, that monarch was indebted for his throne. It is accessible only to vessels of the smallest class, owing to the shallowness of the small river on which it is situated. Pop. variously estimated at from 30,000 to 100,000.

HUE AND CRY, a phrase used in English law to describe the body of persons joining in the pursuit of a felon. Whoever arrests the person pursued is so far protected, that he requires no warrant to justify the arrest; and even if the party turn out to be no felon, no action can be brought if the arrest was *bonâ fide*. But it is not only a ground of action, but an offence subject to fine and imprisonment, to maliciously and wantonly raise the hue and cry against a person. It is the duty of all persons to join in a hue and cry, and if a person who has been robbed, or knows of a robbery, fail to raise the hue and cry, he is liable to fine or imprisonment, or, according to some authors, to indictment; but these punishments are never inflicted.

HUE/LVA, a maritime and trading town in the south of Spain, capital of the modern province of the same name, which was formed out of a portion of the ancient kingdom of Seville (q. v.), is situated at the confluence of the Odiel and the Tinto, 63 miles west-south-west of Seville. The town is in constant communication with Portugal, Cadiz, and Seville; sends great quantities of fruit and floor-mattings to the latter places, and carries on an extensive tunny-fishery. The remains of the Roman aqueduct, which for many years has served as a quarry for the rude and ignorant inhabitants of the vicinity, are now fast disappearing. Pop. 8423.

HUERTA, VICENTE GARCIA DE LA, a Spanish poet and critic of the 18th c., was born in 1729 at Zafra, in Estremadura, but spent the greater part of his life in Madrid, where he held the office of principal librarian of the Royal Library, and where he died on 12th March 1797. He early distinguished himself by his poetic talent. His tragedy of *Rachel*, founded upon the story of the love of King Alfonso VIII. for the fair Jewess Rachel, and its tragical catastrophe, was received with great enthusiasm when first produced in 1778, and is to this day esteemed as one of the very best of modern Spanish tragedies. H. was a most zealous but not always a wise or skilful defender of the ancient Spanish national taste against the Gallicism which then prevailed. As a lyric and dramatic poet, he shews great command of language and versification. His poems were published in two volumes (*Obras Poeticas*, Madrid, 1778—1779). H. edited the *Teatro Español* (17 vols. Madrid, 1785—1786), a collection of the best works of the older Spanish dramatists.

HUE/SCA (the *Oscæ* of the Romans), a very old and picturesque town of Spain, capital of the modern province of the same name (see ARAGON), is surrounded by old walls once surmounted by 99 towers, two of which only remain, and is situated in the midst of a plain covered with vineyards,

on the right bank of the Isuela, 50 miles north-east of Zaragoza. Among its chief buildings are the cathedral, built in 1400, a beautiful Gothic edifice; the university, founded in 1354 by Pedro IV.; and the picturesque college of Santiago. It was once famous as a seat of learning. Tanning and manufactures of linens are here carried on to some extent. Pop. 9874.

HUE/SCAR, a small town of Spain, in the province of Granada, is situated 75 miles north-east of the city of that name, and is said to contain a population of about 6000, who are chiefly employed in the manufacture of linen and woollen goods.

HUET, PETER DANIEL, was born at Caen, February 8, 1630. His father had been converted from Calvinism, but died while H. was still very young. The latter was educated in the Jesuit school of Caen, and was early distinguished by his extraordinary progress in almost every department of learning. He was a zealous pupil of Descartes and of Bochart—the latter of whom he accompanied on his visit to Stockholm in 1652, when he discovered and transcribed the MS. of Origen, which, subsequently, was the basis of his celebrated edition of that father. On his return to Caen, he gave himself up entirely to study; and as a preliminary to his translation of the text of Origen, he published, in 1664, his well-known essay *De Interpretatione*; but it was only at the end of 15 years' study that he published his edition of Origen's *Commentaria in Sac. Scripturam*, 2 vols. fol. (Rouen, 1668), with a most learned introduction, entitled *Origeniana*, which has since been reprinted in the great Benedictine edition of that father. In 1670, H. received the degree of Doctor of Law; and soon after, he was summoned to Paris, to take part, with Bossuet, in the education of the dauphin. In 1679, he published his *Demonstratio Evangelica*. He had an active part, moreover, in the Delphin edition of the classics. In 1676, he entered into holy orders; and in 1678, was named abbot of the Cistercian abbey of Aunay, from which place is named his well-known work, *Quæstiones Alnetanæ de Concordia Rationis et Fidei* (1690). About the same time, also, he published a work *On the Site of the Terrestrial Paradise*, another *On the Voyages of Solomon*, which were followed later by his equally celebrated work in classical geography, *History of the Commerce and Navigation of the Ancients*. In 1685, he was named Bishop of Soissons, a dignity, however, on which he never entered, being transferred to the see of Avranches in 1692. He was as zealous in the discharge of his episcopal duties as he had been in his devotion to literature; but his health having given way, he obtained permission to resign his see in 1699, and retired to the abbey of Fontenay, near Caen; but, in 1701, he took up his residence in the Jesuits' house in Paris, and published, in 1717, his autobiographical memoirs—a model of pure Latinity as well as a most interesting record of the history of his time. H. died in 1721. His works were published in a collected form in 1712, and a volume of *Huetiana* appeared in the year following his death, 1722.

HUG, JOHN LEONHARD, was born at Constance, June 1, 1765, studied at Freiburg, and in 1789 entered into priest's orders. In 1791, he was appointed professor of Oriental languages, and of the Old Testament, to which was added, in 1792, the professorship of the New Testament also. These united professorships H. continued to hold uninterruptedly for upwards of half a century, with the exception of some brief occasional visits to the great libraries of Munich, Vienna, Paris, Milan, Rome, and Naples. The most important fruit of

his biblical researches was his *Introduction to the New Testament*, which appeared in 1808, in 2 vols., and which, besides several German editions, has been translated into most of the European languages. His great eminence as a biblical scholar led to his being called on to take part in the arrangement of the newly organised studies of most of the German universities—as at Breslau, in 1811; at Bonn, in 1816; at Tübingen, in 1817; and again at Bonn, in 1818 and 1831. He died 11th March 1846. His works, which are indifferently in Latin and German, are chiefly in the department of biblical criticism, as *On the Age of the Vatican MS.* (1810), *On the Canticle of Canticles* (1813), and again (1818), *On the Indissolubility of Marriage* (1816), *On the Alexandrian Version* (1818), *Re-examination of Strauss's Life of Jesus*, 2 vols. (1835); but there are also some of them on subjects of classical criticism, especially an interesting work on the ancient mythologies, published in 1812. See Maier's *Gedächtnissrede auf Hug*, Freiburg, 1847.

HUGO, VICTOR MARIE, VICOMTE, one of the most distinguished French writers of the present day, was born, 26th February 1802, at Besançon, where his father was then commandant of the garrison. His mother was a native of La Vendée, and from her he imbibed romantic royalist sentiments, although his father was a most devoted follower of Napoleon. His youth was spent partly with his mother in Paris, partly in Italy and Spain, where his father held high appointments. He early acquired distinction by his poetic effusions; and before he was 30 years of age, his published works were numerous, and his name famous. Odes and ballads, romances, dramas, &c., flowed from his prolific pen. Shortly before the revolution of 1830, a literary revolution took place, at the head of which was Hugo. A band of young men, imaginative, ardent, and confident, sought to renovate French literature, by departing from classic rules and models, substituting a varied and very irregular verse for the monotonous Alexandrines of the old school, and making art precisely conform to nature, which they carried so far as even to bring into prominence things disagreeable, which nature herself is displeased with, and teaches us to keep out of sight. The new school, *la jeune France*, as they called themselves, formed the *Romanticists*, and their opponents, the *Classicists*. The literary war lasted several years. H.'s drama of *Marion Delorme* was received with enthusiasm; and he added to his reputation by the publication of *Feuilles d'Automne*. In 1832, the ministry suspended one of his dramas, *Le Roi s'amuse*; but his popularity continued to increase, and in 1837 Louis Philippe made him an officer of the Legion of Honour, and in 1845 a peer of France. After the revolution of 1848, he was elected to represent Paris, both in the Constituent and in the Legislative Assembly, in which he manifested Democratic principles, and was one of the members of the extreme left who were banished from France for life by Louis Napoleon. He went to reside in the island of Jersey. In 1852, he assailed the ruler of France in a political pamphlet, *Napoleon le Petit*; and next year, in *Les Châtiments*, a series of poems written with great verve, in the same spirit. In 1856, he published his *Contemplations*. He refused to avail himself of the amnesty of August 15, 1859; but on the fall of the empire, hastened back to his native country, joined in the republican movement, and was returned to the National Assembly at Bordeaux, which, however, he soon quitted in disgust. He then went to Brussels, but the Belgian government expelled him from the country, and he had to seek refuge in Vianden, a village of Luxemburg, where *L'Année*

Terrible was composed. Returning to Paris in July 1871, he pleaded earnestly, but without effect, for the lives of the Communists. H. has given an account of his life in *Actes et Paroles*, 1870—1872. 1862 witnessed the publication of *Les Misérables*, a prose romance treating of social questions; and his last novel, *L'Homme qui Rit*, appeared in 1869.

H.'s writings have great faults. They are often extravagant both in form and substance, and sometimes marred by an affected triviality of images and harshness of versification. Yet they have also great excellences, the command of language shewn is wonderful, and as a lyric poet H. has, perhaps, never been equalled in France.

HUGUENOTS (probably corrupted from the Ger. *eidgenossen*, confederates), the name formerly given in France to the adherents of the Reformation. This movement commenced almost simultaneously in France and Germany. One of the most eminent names in the early history of French Protestantism is that of Farel (q. v.), and one of the first supporters of its cause was Margaret of Valois, queen of Navarre, the sister of Francis I. Subsequently, in the time of Calvin, many of the nobles and middle classes embraced the reformed religion. Francis I., however, opposed it with great severity, and caused many to be burned as heretics. The alliance of Henry II. with the German Protestants gave at first an impulse to the cause of the Reformation, but the aspect of things was again changed when the family of Guise obtained the ascendancy at court. Under Francis II., a chamber (*chambre ardente*) was established in each parliament for the punishment of Protestants; and executions, confiscations, and banishments were common in all parts of the kingdom. The Protestants took up arms against the government, choosing Louis I., Prince of Bourbon-Condé, for their leader. On February 1, 1560, in a meeting at Nantes, they resolved to petition the king for freedom of religion, and for the removal of the Guises; and in the event of his refusal, to seize the king's person, and proclaim Condé governor-general of the kingdom. But the court, being apprised of the conspiracy, fled from Blois to Amboise, and the Duke of Guise was appointed governor-general. Some bands of Protestants, approaching Amboise with weapons in their hands, were easily defeated and taken; 1200 died by the hand of the executioner. The Edict of Romorantin, in May 1560, took the prosecution of heretics out of the hands of the parliament, and gave it into those of the bishops. By the Assembly of Notables in August, it was resolved that the whole matter of religion should rest until the next Assembly of the States. Whilst the Guises plotted the death of the Protestant leaders, Charles IX. ascended the throne, a prince not yet of age; and the queen-mother, Catharine de Medici (q. v.), having removed the Guises from the helm of the state, was compelled to seek the support of the Protestants against them and their party. In July 1561, appeared an edict which freed the H. from the penalty of death. For the complete termination of strife, the court opened a religious conference at Poissy on the 3d of September. The chief disputants were the Cardinal of Lorraine on the one side, and Theodore Beza (q. v.) on the other. The effect of the discussion was to unite and embolden the Protestants, with whom the machinations of the Guises forced Catharine into closer alliance. On January 17, 1562, appeared an edict, giving noblemen the right of the free exercise of their religion on their own estates.

The Guises and their partisans became exasperated. On March 1, 1562, a company of Protestants met in a barn at Vassy for religious exercises, was

attacked, and many of them were massacred by the followers of the Duke of Guise. On this, Condé hastened to Orleans, and called his co-religionists again to his standard; whilst the Guises took possession of the persons of the king and his mother, and proclaimed the Protestants rebels. On September 11, 1562, the royal troops, after much bloodshed, took Rouen, and on December 19 a battle was fought at Dreux, in which, after a hard struggle, the Protestants were defeated. The Duke of Guise marched on Orleans, but was assassinated in his camp before that city, February 18, 1563. Hereupon the queen-mother hastened to conclude the peace of Amboise on March 19, by which the Protestants were allowed the free exercise of their religion, except in certain districts and towns. Catharine, however, hated the new faith, and formed a close alliance with the Spaniards for the extirpation of heresy, retrenched the new liberties of the Protestants, and made attempts upon the liberty and the life of Condé and of the Admiral Coligny (q. v.). These leaders of the Protestant party adopted the resolution of taking possession of the king's person. The court fled to Paris, which Condé invested; but on 10th November 1567, a battle was fought at St Denis between Condé and a much superior force under the Constable Montmorency (q. v.), in consequence of which Condé fell back into Lorraine, where he effected a junction with an auxiliary force of 10,000 men from Germany, under Prince John Casimir. After this, he again threatened Paris; upon which Catharine concluded peace at Longjumeau on 27th March 1568, re-establishing the terms of the treaty of Amboise. Nevertheless, she proceeded to persecute the Protestants, of whom 3000 were assassinated or executed. The Protestants having, however, received assistance in troops from Germany, and in money and artillery from England, began the third religious war. But on March 13, 1569, they were defeated, and Condé their leader slain, at Jarnac by the royal troops under the Duke of Anjou, afterwards Henry III. These misfortunes greatly dispirited the Protestants. Jeanne d'Albret, queen of Navarre, endeavoured to reanimate them in an assembly at Cognac, and set up her son, afterwards Henry IV., as the head of the Protestant cause. Coligny became their military leader, and having received further assistance of troops from Germany, he laid siege to Poitiers, but was again defeated by the Duke of Anjou at Moncontour, on 3d October. Fresh reinforcements from England, Switzerland, and Germany, enabled Coligny to take Nismes in 1569, and to relieve Rochelle, whilst Lanoue obtained a victory over the royal troops at Lugon. Catharine and her son now sought for peace, to which the Protestants, weary of the hard contest, consented. The treaty, concluded at St Germain-en-Laye on August 8, 1570, gave to the Protestants an amnesty, the free exercise of their religion everywhere except in Paris, and the possession of a number of places of security.

Catharine, having failed to overthrow the Protestant cause in the open field, sought to accomplish her object by treachery, and by a general massacre of Protestants on ST BARTHOLOMEW'S DAY (q. v.) 1572. Although deprived of their leaders, and weakened by the slaughter of great numbers of their best and bravest, the Protestants flew to arms. The Duke of Anjou, after having lost his army before Rochelle, took advantage of his election to the throne of Poland, and on June 24, 1573, concluded a peace, by which the Protestants obtained the free exercise of their religion in their places of security, Montauban, Nismes, and Rochelle, and a certain concession of liberty of conscience. A section of the Roman Catholic nobility, at whose head was the

Duke of Alençon, the youngest son of Catharine, from purely political motives, united with the Protestants in opposition to the government of the queen-mother and the Guises. Catharine, therefore, incited her third son, Henry III., who had now succeeded to the throne, immediately to recommence hostilities against the Protestants. But, contrary to all expectation, the Protestant cause was in the highest degree prosperous during the year 1575. A peace was concluded at Beaulieu on 8th May, by which the Protestants were freed from all restrictions in the exercise of their religion, and obtained a number of places of security. The king also paid their German auxiliaries. The Duke of Guise, thus frustrated in his political designs, originated a Catholic association, called the Holy League, at the head of which the king put himself in the Assembly of the States at Blois, on November 6, 1576, and then the sixth religious war began. Peace was, however, again concluded by the king himself at Bergerac, in September 1577, on the former conditions; and Catharine, to diminish the power of the Duke of Guise, entered into a private treaty with Henry of Navarre at Nerac, by which several places of security were made over to the Protestants. The terms of peace being violated by the court, Henry I., Prince of Condé, son of Louis I., and, like his father, a leader of the Protestant party, commenced the seventh religious war (called the *guerre des amoureux*) in November 1579, by the occupation of Laferre, and Henry of Navarre, in April 1580, took Cahors. But Condé, having been driven out of Laferre by Matignon, and Henry of Navarre vanquished at Mont-Cabel by Biron, peace was concluded at Fleix, November 1580.

There was now a comparatively long interval of repose till 1584, when, by the death of the Duke of Anjou (formerly of Alençon), Henry of Navarre became heir to the throne of France. Hereupon Henry, Duke of Guise, exerted himself for the revival of the League, entered into an alliance with Spain and the pope for the extirpation of heresy, declared the Cardinal of Bourbon heir to the throne, and began hostilities against the Protestants. This war is commonly known as the 'war of the three Henrys.' The king soon made terms with him, and declared all the privileges of the Protestants to be forfeited. The Protestants, having obtained troops from Germany and money from England, entered on the eighth religious war, which was prosecuted with various success, Henry of Navarre commanding the Protestant army. The Duke of Guise, in the midst of these troubles, grasped the whole power of the state. But his designs with regard to the throne having become very evident, the king caused him and his brother the cardinal to be assassinated at the Assembly of the States at Blois in September 1588. In less than a year, the king was himself assassinated by a monk named Jacques Clement, and Henry of Navarre succeeded to the throne, and signed the famous EDICT OF NANTES (see NANTES), on 13th April 1598, by which the rights of the Protestants were established and enlarged.

Under the reign of Henry IV., whose great minister, Sully, was himself a Protestant, the Protestants lived in tranquillity. But when, during the minority of Louis XIII., Mary de Medici, the queen of Henry IV., assumed the reins of government, the independence which the Protestants enjoyed stood too plainly in the way of a court bent upon absolutism. The king, indeed, took an oath in 1614 to maintain the Edict of Nantes, but the marriage treaties with the Spanish court excited the apprehensions of the Protestants to such a degree that, in November 1615, they made common cause

with the Prince of Condé, who had then set up the standard of rebellion. This they did contrary to the advice of the most sagacious of their own party. Although by the treaty of Loudun, 4th May 1616, they obtained a new confirmation of their freedom of worship, the court now only waited for an opportunity of breaking at least their political power. In June 1617, a royal edict commanded the entire suppression at once of the Protestant Church, and of political privileges, in the province of Béarn; but the provincial court at Pau refused to register the edict, and the matter lay over till 1620, when, at the instigation of the Jesuits, and of his favourite De Luynes, the king carried the edict into full effect by force of arms. The Protestants throughout all France took alarm, and hostilities again broke out in May 1621. At the head of the Protestants were the two brothers, the Duke of Rohan and the Prince Soubise. Their cause, however, was feebly maintained; almost all the Protestant towns fell into the hands of the king, force, stratagem, and bribery being equally employed. At last, after the capitulation of Montpellier, 21st October 1622, there followed a general peace, by which the Edict of Nantes was confirmed, but the right of prohibiting the assemblies of the Protestants was assumed on the part of the crown. The court, however, paid little attention to the stipulations of the treaty, and when the government was involved in difficulties in Italy, the Protestants took the opportunity again to rise in arms. Soubise, with a fleet furnished by the town of Rochelle, oftener than once defeated the weak royal navy. Cardinal Richelieu (q. v.), who was now at the helm of affairs, found himself under the necessity of making offers of pacification, which were rejected. Hereupon the cardinal resolved upon the capture of Rochelle, the most important stronghold of the Protestants. This he accomplished after a heroic resistance by the inhabitants. The fall of Rochelle was speedily followed by that of Nismes, Montauban, Castres, and all the other Protestant strongholds. Now left defenceless, the Protestants were entirely dependent on the will of the court, which, however, made no attempt to deprive them of their liberty of conscience. It was Louis XIV., when he became superstitious in his old age, who, at the instigation of Madame de Maintenon and his confessor Lachaise, commenced anew the persecution of the Protestants. He gradually deprived them of their equal civil rights, and endeavoured to put down the Protestant Church altogether. Bodies of troops, accompanied by monks, passed through the southern provinces, compelling the inhabitants to renounce their religion, demolishing the places of worship, and putting to death the preachers. Hundreds of thousands of Protestants fled to Switzerland, the Netherlands, England, and Germany. In vain was it attempted to restrain this self-expatriation by cordons along the borders. Many Protestants also made an insincere profession of Roman Catholicism. These, on the slightest appearance of relapse, were put to death. On 23d October 1685, Louis at last revoked the Edict of Nantes. (See Rulhière, *Eclaircissements Historiques sur les Causes de la Révocation de l'édit de Nantes*, 2 vols. Paris, 1788.) Hereupon began a new flight, followed by a still more fearful persecution of the Protestants. Their marriages were declared null; their children deprived of the right of inheritance, and forcibly shut up in convents; their preachers indiscriminately put to death. From the vicinity of Nismes, where they had always been very numerous, thousands betook themselves to the mountains of the Cévennes, and continued the exercise of their religion in secret. Amongst these and the mountaineers of the Cévennes, a

remarkable fanatical enthusiasm displayed itself, and, under the name of Camisards, they maintained for a number of years a wonderfully successful opposition to the forces of the great monarchy. The *War of the Cévennes* (q. v.), or *Camisard War*, was not terminated till 1706, the suppression of the local rebellion being attended with circumstances of great cruelty. France had lost by this time more than a million of her most active, enterprising, and industrious citizens; and, notwithstanding all the persecutions, about two millions continued to adhere to the Protestant religion.

The partial repose which the Protestants enjoyed for more than ten years was attended by a revival of their worship, especially in Provence and Dauphiné. In 1724, therefore, Louis XV., at the instigation of the Jesuits, issued a severe edict against them. The spirit of the age, however, now began to be opposed to persecution. An edict of 1752 declared marriages and baptisms by Protestant ministers to be null, and required the repetition of them by the Roman Catholic clergy. But when, upon this, many began again to flee from their country, the disgust of the Roman Catholics themselves was so much excited, that the court recalled the edict. Montesquieu successfully advocated the cause of toleration; Voltaire did much to promote it by his exposure of the judicial murder of John Calas (q. v.). At last, by an edict in 1787, which indeed was not registered by the parliament till 1789, Louis XVI. declared the Protestant marriages and baptisms to be valid, and restored to the Protestants equal civil rights, except that they might not be advanced to public offices and dignities. Even in 1789, a proposal for the complete emancipation of the Protestants was rejected by the National Assembly, which, however, admitted Protestants, and even Protestant preachers as members without objection; and in 1790, it passed a decree for the restitution of all the properties of non-Catholics confiscated since the time of Louis XIV. The *Code Napoleon* gave Protestants in France equal civil and political rights with Roman Catholics. The charter granted by the Bourbons acknowledged the freedom of Protestant worship, and the state pledged itself for the maintenance of the pastors; yet, under the government of the Restoration, the privileges of Protestants were in many ways circumscribed. After the revolution of July 1830, the Reformed Charter of France proclaimed universal freedom of conscience and of worship, which principle has been maintained in subsequent changes. Protestants are not now subjected to many exceptional hardships, and have in various important instances been protected by the imperial authority from the arbitrary exercise of power attempted by illiberal local magistrates adverse to their religion. But the *recognised* Protestant Church—in which are included both *Reformed* and *Lutherans*, and of which the pastors receive small salaries from the state (see FRANCE)—is not permitted to hold synods or general assemblies; its affairs being managed by local *consistories*, somewhat analogous to kirk-sessions and presbyteries in Presbyterian churches, but of which by law those members of the congregation are members who pay the highest amount of taxes.

HUILE DE CADE, a brownish, inflammable, oily liquid, obtained by the dry distillation of the wood of *Juniperus Oxycedrus*. It has a strong odour of tar, and an acrid, caustic taste. It is almost entirely manufactured in France, and hence its name. It is employed externally in veterinary medicine, and has been used in the human subject both externally and internally, but chiefly externally in chronic skin-diseases. It is a good local

remedy in toothache. It has been given internally in worms, but is a dangerous and uncertain remedy.

HU'LDA, or **HOLDA**, 'the friendly, the benignant,' well known in old German legends and traditions as *Frau Holle*, was originally a goddess of marriage and fecundity. Worshipped and invoked by maids and wives, to the former, she sent bridegrooms, to the latter, children; great numbers of whom surrounded her in her favourite haunts in the depths of the sea, or the hearts of hills. She was also the patroness of agriculture and domestic life, with its manifold employments. Sometimes she was regarded as a celestial being, and long ago the people used to say when the snow fell: 'Hulda is making her bed.'

HULK, a name given to any old ship unfit for sea-service, which is used in harbour as a depôt of some sort. In the great naval harbours, there are coal-hulks, powder-hulks, convict-hulks, and hulks to which the crews of vessels repairing are turned over.

HULL. The hull of a ship is her main body, exclusive of masts or rigging.

HULL, or **KINGSTON-ON-HULL**, an important and flourishing English river-port, a parliamentary and municipal borough and county of itself, is situated in the East Riding of Yorkshire, in a low, level plain on the northern bank of the Humber, at the confluence of the Hull with that river, 53 miles east-south-east of York. The town and harbour were defended by two forts, the remains of the old fortifications, by several batteries, and by a garrisoned citadel, which commands the entrance of the Hull roads, and is mounted with 21 guns; but the forts are removed to High Paul, a village a few miles lower down the river Humber. Of the ecclesiastical edifices, the most notable are the Church of the Holy Trinity, a beautiful and ornate Gothic structure, the transept of which is the oldest English brick-building in the country; and St Mary's Church, Lowgate, one half of which was removed to make room for the mansion-house of Henry VIII., who occasionally resided here. Both these churches are now being artistically restored. The most important educational establishments are the Hull Grammar School, and Trinity House School, where 36 boys receive a nautical education. The other principal buildings are the custom-house, the dock, pilot, excise, post, and stamp offices, and the Exchange. An equestrian statue of William III. stands in the market-place, and a statue of Wilberforce, placed on the top of a fluted Doric column, resting on a pedestal. Among many other benevolent establishments, the Trinity House, instituted for the relief of decayed seamen, and the Charter House, an endowed institution for the poor, are the most worthy of note. The accommodation of the shipping of H. is provided for by the extensive range of docks encircling the town on the land side. The docks are very extensive, and additions are from time to time being made to them. H. is a principal steam-packet station, and ocean-steamers ply regularly along the eastern British coasts, and to many of the principal ports of Belgium, the Netherlands, and Denmark. H. is the great outlet for the woollen and cotton goods of the midland counties, with all of which it is in direct communication, by means of railway, river, or canal. Many ship-building yards are in operation here, and the chief manufactures are those principally to which a flourishing port gives rise, as ropes, canvas, chain, chain-cables, machinery, &c. Many mills of various kinds are here carried on, as well as chemical factories, tanneries, potteries, and sugar-refineries. Immense commercial intercourse subsists between H. and

the countries of Northern Europe, the principal exports being woollen and cotton manufactured goods, and the imports timber, corn, wool, iron, flax, hemp, tallow, hides, pitch, bones, and horn. Upwards of 7000 vessels, of (in round numbers) 2,000,000 tons, enter and clear the port yearly. H. returns two members to the House of Commons. Pop. 123,408.

HULSEAN LECTURES, &c. The Rev. John Hulse, of Elworth, in the county of Chester, was born at Middlewich, in 1708, and was educated at St John's College, Cambridge. Having no children, he bequeathed the bulk of his property to the university. His will, an extraordinary document, containing 400 pages folio, of closely written manuscript, with nine codicils appended, provides for the founding of two divinity scholarships in St John's College, the Hulsean Prize, the office of Christian Advocate, and that of Hulsean Lecturer or Christian Preacher. By a statute confirmed by the Queen in council in 1860, the office of Christian Advocate was changed into a professorship, called the Hulsean Professorship of Divinity. Bishop Ellicot was the first professor under the new statute. The office of Hulsean Lecturer, or Preacher, is an annual one; and the duty of the lecturer is to preach not less than four, nor more than six sermons before the university in the course of the year.

HU'MANISTS (Lat. *literæ humaniores*, polite letters), the name assumed in the beginning of the 16th c. by the party who devoted themselves specially to the cultivation of classical literature, and who, as not unfrequently happens in the enthusiasm of a new pursuit, arrayed themselves in opposition to the received system of the schools, not alone in the study of the classical languages, but even in philosophy, and eventually in theology.

HUMANITA'RIANS, the name assigned to the several classes of anti-Trinitarians, who regard Christ as a mere man, and refuse to ascribe to him any supernatural character, whether of origin or of nature. In this class are commonly enumerated the early Judaizing sects of Ebion and Cerinthus; but this is by no means certain, at least as regards the former, who taught that at the baptism in the Jordan the Demiurge descended upon Christ, and was united to him. The earliest recorded author of the purely Humanitarian theory is Theodotus of Byzantium, surnamed the Currier, who, having denied Christ in time of persecution, defended himself afterwards by declaring that in so doing 'he had denied not God, but man.' A contemporary of Theodotus, Artemon, taught in like manner that Christ was a mere man, and asserted that such had been the universal belief of Christians till the time of Zephyrinus, 202. These opinions must be carefully distinguished from the doctrines of the various sects of Arians, even the lowest schools of which have admitted the pre-existence of Christ, and his pre-eminence among the creatures of God.

The name Humanitarian is also sometimes applied to the disciples of St Simon, and in general to those who look to the perfectibility of human nature as their great moral and social dogma, and ignore altogether the dependence of man upon supernatural aid, believing in the all-sufficiency of his own innate powers.

HUMBER, the continuation and estuary of the river Ouse (q. v.).

HUMBLE-BEE (*Bombus*), a genus of social bees (see BEE), having a thick and very hairy body, the hairs often arranged in coloured bands; and also differing from the honey-bees in having the tibia of the hinder-legs terminated by two spines. The

species are numerous, and are found in almost all parts of the world, from the equator to the utmost polar limits of vegetation, but they seem to abound most of all in temperate climates. About forty are natives of Britain, one of the largest of which, and of British hymenopterous insects, is the common *H. (B. terrestris)*, the *Bumblee* (boom-bee) of the Scotch; black, with a yellow ring before the wings, and another on the abdomen, the apex of the abdomen white. Another of the largest species is the RED-TAILED BEE (*B. lapidarius*), and one of the most abundant is the yellow and orange Moss-bee (*B. muscorum*), the *Foggie* of the Scotch. Some of the tropical species are much larger than any found in Britain. The name *H.* is supposed to be a modification of *Hummel* or *Hummer Bee*, and to refer to the loud hum produced by the wings of these insects.

Humble-bees do not form communities so large as those of honey-bees; seldom more than two or three hundred occupying one nest, and in some species not more than fifty or sixty. The females are much less prolific than those of honey-bees. The community is dissolved on the approach of winter, the males and workers die, and only females remain in a torpid state—among moss, in rotten wood, or in some other situation where they may enjoy protection from frost, and concealment from enemies—to perpetuate the race by founding new communities in the ensuing spring. The nests of some species, as *B. terrestris*, are in holes in the ground, at the depth of a foot or more, floored with leaves, and lined with wax, and often entered by a winding passage. Others, as *B. lapidarius*, make their waxen nests among stones; while others still, as *B. muscorum*, make them among moss, which they mix and join with wax. The nests are

Humble-Bees and Nest :

1, humble bee and nest; 2, orange-tailed bee; 3, moss bee.

enlarged as the community increases. Some of the eggs are deposited in balls of mingled pollen and honey, on which the larvæ feed, one ball containing several larvæ; afterwards, eggs are also deposited in waxen cells. Workers are chiefly produced in the earlier part of the season, males and perfect females in the latter part of it. The females are larger than the males and workers. Humble-bees differ from honey-bees in their females existing together in the same community without seeking to destroy one another. There is among them nothing analogous to swarming. Their combs do not exhibit the beautiful regularity of structure which characterises those of honey-bees; but cells of a comparatively coarse appearance are clustered together, with silken cocoons of pupæ, balls of

the kind already noticed, and open cells or pots filled with honey, the frequent prize of schoolboys and youthful haymakers, who know well how to open and plunder the humble-bee's nest. Many animals are also expert in this, as badgers, foxes, rats, &c., which, however, devour the brood as well as the honey.

HUMBOLDT, FRIEDRICH HEINRICH ALEXANDER, BARON VON, one of the greatest of naturalists, and who has contributed more than any man of modern times to the progress of several departments of physical science, was born at Berlin, 14th September 1769. His father, whom he lost when he was not quite ten years of age, was chamberlain to the king of Prussia. He studied at the universities of Frankfurt-on-the-Oder, Berlin, and Göttingen. His love of natural history was very strongly manifested at this period; and during his residence at Göttingen (1789—1790), he made visits of scientific exploration to the Harz and the banks of the Rhine, the fruit of which was his first publication, 'On the Basalts of the Rhine,' &c. In the spring and summer of 1790, he accompanied George Forster in a tour through Belgium, Holland, England, and France. In June 1791, he entered the Mining Academy at Freiberg, where he enjoyed the private instructions of Werner. His eight months' residence here led to the subsequent publication of his *Flora Subterranea Fribergensis et Aphorismi ex Physiologia Chemica Plantarum* (Berlin, 1793). He was afterwards appointed to an office in the mining department, and spent some years in this capacity, chiefly at the Fichtelgebirge, in Upper Franconia. His researches here resulted in a work 'On the Irritability of the Muscular and Nervous Fibres, with Conjectures regarding the Chemical Process of Life in the Animal and Vegetable World' (*Ueber die Gereizte*, &c., 2 vols. Berlin, 1797—1799).

The desire of visiting tropical countries, however, led him to resign his office, and devote himself entirely to the study of nature. He spent three months at Jena, where he was the intimate associate of Goethe and Schiller, and studied anatomy under Loder. Circumstances now led him to Paris, where he contracted a friendship with a distinguished young botanist, Aimé Bonpland (q. v.), afterwards his companion in many and various scenes. Some time after, he obtained permission from the Spanish government to visit all the Spanish settlements in America and the Indian Ocean, with every additional favour which could promote his researches in the various departments of natural science. He sailed from Corunna, along with Bonpland, on 5th June 1799. They visited Teneriffe, ascended the Peak, and made many scientific observations. On 16th July, they arrived at Cumana in South America, and in the course of five years explored a vast extent of territory in Venezuela, Granada, Ecuador, and Peru, whence they sailed for Mexico, which they crossed from west to east. On 7th March 1804, H. sailed from Vera Cruz for Havana, where he spent two months, completing the preparation of materials afterwards employed in his *Essai Politique sur l'Isle de Cuba* (Paris, 1826). From Havana he proceeded by sea to Philadelphia, and thence to Bordeaux, where he arrived after a course of travels unparalleled for variety and importance of scientific results, not only in the different departments of natural history, but also in geography, statistics, and ethnography.

H. resided in Paris till March 1805, occupied in the arrangement of his collections and manuscripts, and jointly with Gay-Lussac in experiments on the chemical constitution of the atmosphere. Having

visited Italy, and returned to Berlin, he accompanied Prince Wilhelm of Prussia in 1807 on a political mission to France, and obtained leave from the government of his own country to remain there, for the publication of his travels, for which the disturbed state of Germany at that time did not allow proper opportunity. He continued to reside in Paris till 1827. In 1807—1817, his great work, embodying the chief results of his travels, appeared in two forms, folio and quarto, in each consisting of 29 volumes, and containing 1425 copper-plates. The wish of the king that he should reside in his native country was gratified in 1827, when he proceeded to Berlin, and there, in the winter of 1827—1828, he gave lectures on the *Cosmos*, or physical universe.

In 1829, H. again became a traveller, the Emperor Nicholas then sending out a well-appointed expedition to the north of Asia, to explore the Ural and Altai Mountains, the Chinese Dsongarei, and the Caspian Sea. In this expedition, H. was accompanied by his two friends, Ehrenberg and Gustavus Rose. Its principal results were the scientific examination of the beds which produce gold and platina, the discovery of diamonds in an extra-tropical region, the astronomical determination of positions, magnetic observations, and geological and botanical collections. The whole journey occupied nine months, and extended to 2320 miles. It is described in Rose's 'Mineralogical and Geological Travels to the Ural, the Altai, and the Caspian Sea' (*Mineralogisch-geognostischer Reise*, &c., 2 vols., Berlin, 1837—1842), and in H.'s *Asie Centrale, Recherches sur les Chaînes de Montagnes et la Climatologie comparée* (3 vols., Paris, 1843). This expedition must be regarded as having also led to much increase of our knowledge of the earth's magnetism, through the adoption by the Emperor of Russia of H.'s proposal for the establishment of magnetic and meteorological stations from Petersburg to Peking; which was followed, on H.'s application to the Duke of Sussex, by the establishment of similar stations in the southern hemisphere.

The political changes of the year 1830 led to H.'s employment in political services. He had been long on friendly terms with the members of the House of Orleans, and therefore, after Louis Philippe ascended the French throne, he was chosen by the king of Prussia to carry to Paris his recognition of the new sovereign, and was afterwards, during the ensuing twelve years, frequently sent to Paris to reside for four or five months. He accompanied the king of Prussia also in visits to England, Denmark, &c. During this time, he published his *Examen Critique de la Géographie du Nouveau Continent* (5 vols., Par. 1835—1838).

H. spent the latter years of his long life at Berlin, where he occupied a high position at the Prussian court. His last great work, *Cosmos* (4 vols. Stuttg. 1845—1858), has been unanimously recognised as one of the greatest scientific works ever published, exhibiting in most lucid arrangement many of the principal facts of the physical sciences, and their relations to each other. It has been translated into all the languages in which a book of science is required. The germ of the work was the author's *Views of Nature* (*Ansichten der Natur*, Stuttg. 1808). H. died May 6, 1859.

It is not easy to estimate the amount of H.'s contributions to science. The geography of Spanish America was most imperfectly known previous to his travels there, during which he astronomically determined more than 700 positions, and he bestowed much labour on the preparation of the maps in which his discoveries were exhibited. His barometrical observations were likewise very numerous, as well as his observations on all points connected

with meteorology. To him we are indebted for the most important generalisations concerning magnetism and also climate, some results of which are exhibited in the isothermal and other lines which have begun to be drawn in our maps.

Among his botanical works, that on the geography of plants, *De Distributione Geographica Plantarum secundum Celi Temperiem et Alitudinem Montium* (Paris, 1817), must be reckoned the most important. It was preceded by an *Essai sur la Géographie des Plantes* (Paris, 1805). The botanical discoveries made by himself and Bonpland in their American travels were given to the world in a number of works by H. and Kunth, published at Paris from 1809 to 1834. He gave to the world also his observations, many of them most valuable, which were made at the same time, in zoology and comparative anatomy; and in a magnificent volume, *Vues des Cordillères et Monuments des Peuples Indigènes de l'Amérique*, he directed the attention of Europe to the monuments of a little known antiquity in America, and shewed for the first time the possibility of combining artistic beauty with scientific accuracy. He published in 1823 an *Essai Géognostique sur le Gisement des Roches dans les deux Hémisphères* (Paris); and in 1831, *Fragments de Géologie et Climatologie Asiatique* (2 vols., Paris). In 1811, he produced a work on political economy, *Essai Politique sur le Royaume de la Nouvelle Espagne* (2 vols., Paris), abounding in philosophical reflections as well as in statistical facts. He obtained distinction also by his labours in the determination of the magnetic equator, and by his observations on electrical eels, and on the respiration of fishes and young crocodiles. His labours have won him a high name in almost every department of science.

HUMBOLDT, KARL WILHELM, BARON VON, the elder brother of the preceding, eminent as a statesman, and for his works in philology, aesthetics, and general literature, was born at Potsdam, 22d June 1767, and educated at Berlin, Frankfurt-on-the-Oder, and Göttingen. He eagerly studied antiquities, aesthetics, and the Kantian philosophy, as well as law, to which he professedly devoted himself. After travelling in Germany, France, and Switzerland, he acquired the rank of counsellor of legation, but shewed little inclination for official employment, and in 1791 married, and for some years resided chiefly on his wife's estate in Thuringia, and afterwards in Jena, associating most intimately with Schiller, and devoting himself to poetry and other literary and scientific pursuits. A valuable memorial of his friendship with Schiller is the correspondence between them (*Briefwechsel zwischen Schiller und Wilhelm von Humboldt*, Stuttg. and Tüb. 1830), published by him after Schiller's death. From 1797 to 1799, H. resided partly in Paris and partly in Spain, and in 1801 became Prussian resident at Rome, where he remained for a number of years, in this capacity, and in that of minister-plenipotentiary, a most generous patron of young artists and men of science. From Rome he returned to his native country, to fill the high place of first Minister of Public Instruction, in which capacity he did much to promote education in Prussia. The Berlin university owed its existence to him. In 1810, he went to Vienna as minister-plenipotentiary, and from this time he took part in all the most important political affairs in which his country was concerned. After 1819 he resided chiefly at Tegel, where he laid out fine pleasure-grounds, and formed a noble collection of sculptures by the greatest masters. He died 8th April 1835.

His earliest literary works were collected by himself under the title of 'Æsthetic Essays' (*Æsthetischen Versuchen*, Brunswick, 1799). His 'Collected

Works' appeared at Berlin (7 vols. 1841—1852). H. devoted himself with the greatest eagerness and assiduity to the study of philology, and produced several works on the Basque tongue, and the evidence which it affords concerning the aboriginal inhabitants of Spain—the languages of the East, and various questions connected with Oriental literature, and the languages of the South Sea Islands. One of his most important works is that 'On the Kawi Language in the Island of Java' (*Ueber die Kavisprache*, &c., 3 vols., Berlin, 1836—1840), published after his death by Edward Buschmann; the introduction to which, *On the Variety of Structure in Human Speech*, &c., and its influence on the intellectual progress of mankind, may be said to mark a new era in the science of philology, and has given occasion to many further researches and publications. *Wilhelm von Humboldt's Briefen an eine Freundin*, Leip. 1847 (Wilhelm von Humboldt's Letters to a Lady Friend), exhibit his character in a most pure and amiable light. This work has been translated into English.

HUMBOLDT, a river in the west part of Utah Territory, United States, America, formed by the union of two streams which rise on the west side of the Humboldt Mountains. It is a small and rapid stream, 350 miles in length, unnavigable even for canoes, strongly impregnated with alkaline matter, and after a westerly course, falls into a lake 40 miles in circumference, known as the Sink of Humboldt's River, which has no outlet. The banks are destitute of trees or shrubs, and the region through which it flows is one of the most barren in Utah. The valley of this river is the usual emigrant route from the Great Salt Lake to California.

HUME, DAVID, the philosopher and historian, was born at Edinburgh on the 26th of April (O. S.) 1711. His father was the laird or proprietor of the estate of Ninewells in Berwickshire, but David, being the younger son, had to make his own fortune with no other assistance than an education and the influence of his respectable family. He was educated at home and at the college of Edinburgh. His father designed law as his profession, and he submitted to the initial steps of the proper practical training, but it was not a pursuit to his liking. Deserting it, he experimented on a mercantile house in Bristol, but commerce was not more congenial to him than jurisprudence, and he gave it a very short trial. He now became a musty student, devoting himself to books with no settled practical object before him. He has recorded his sufferings at this time from despondency and depression of spirits, caused, apparently, by the effects of monotonous study on the stomach. At 23 years of age, he went to France, and lived some time in La Fleche, where he describes himself as wandering about in solitude, and dreaming the dream of his philosophy. In 1739, he published the first and second book of his *Treatise on Human Nature*—the germ of his philosophy, and still perhaps the best exposition of it, since it has there a freshness and decision approaching to paradox, which he modified in his later works. Although the dawn of a new era in philosophy, this book was little noticed. It was a work of demolition. By separating the impressions or ideas created on the thinking mind by an external world from the absolute existence of that world itself, he shewed that almost everything concerning the latter was taken for granted, and he demanded proof of its existence of a kind not yet afforded. It was thus that he set a whole army of philosophers at work, either to refute what he had said, or seriously to fill up the blanks which he discovered, and hence he originated both the Scotch and the German school of metaphysicians. In 1741

and 1742, he published two small volumes, called *Essays Moral and Political*; they were marked by learning and thought, and elegantly written, but are not among the more remarkable of his works. He felt keenly at this time the want of some fixed lucrative pursuit, and his longing for independence was the cause of a sad interruption to his studious and philosophical pursuits. He was induced to become the companion or guardian of an insane nobleman, and had to mix with the jealousies and mercenary objects of those who naturally gather round such a centre. In 1747, he obtained a rather more congenial appointment, as secretary to General St Clair, whom he accompanied in the expedition to the coast of France and the attack on Port L'Orient, the dépôt of the French East India Company; this affair had no important results, but it gave H. a notion of actual warfare. Next year, he accompanied the general in a diplomatic mission to France, and as he travelled he took notes of his impressions of Holland, Germany, and Italy, which are published in his *Life and Correspondence*. In 1751, he published his *Inquiry into the Principles of Morals*, a work of great originality, and one of the clearest expositions of the leading principles of what is termed the utilitarian system. At the same time, he intended to publish his *Dialogues concerning Natural Religion*, but his friends, alarmed by the sceptical spirit pervading them, prevailed on him to lay them aside, and they were not made public until after his death. In his 35th year, he had unsuccessfully competed for the chair of Moral Philosophy in Edinburgh, and at this period we find him unsuccessful in an attempt to obtain the chair of Logic in Glasgow. Next year, in 1752, appeared his *Political Discourses*. Here, again, he made an era in literature, for in this little work he announced those principles of political economy comprehending the doctrine of free-trade, which it fell to his friend Adam Smith more fully and comprehensively to develop. He was appointed at this time keeper of the Advocates' Library, with a very small salary, which he devoted to a charitable purpose. It was here that, surrounded with books, he formed the design of writing the history of England. In 1754, he issued a quarto volume of the *History of the Stuarts, containing the Reigns of James I. and Charles I.*, and presently completed this portion of the work in a second volume, bringing it down to the Revolution. He then went backwards through the House of Tudor, and completed the work from the Roman period downwards in 1762. While so employed, he published *Four Dissertations: the Natural History of Religion; of the Passions; of Tragedy; of the Standard of Taste* (1757). Two other dissertations, intended to accompany these, were cancelled by him after they were printed—they are *On Suicide* and *The Immortality of the Soul*, and were subsequently printed in his works.

In 1763, he went to France as secretary to Lord Hertford's embassy; here he was in his element, and found fame at last. He became familiar with the brilliant wits and savants of the Parisian circle—with Turgot, D'Alembert, Helvetius, Holbach, Diderot, Buffon, Maeshherbes, Crebillon, and the rest, as well as with the no less distinguished female eminences, De Boufflers, Page de Boccage, Geoffrin, Du Deffand, and L'Espinasse. His sojourn in Paris was unfortunate in bringing him into intimacy with the restless, vain, and self-tormenting Rousseau, who, after experiencing much substantial kindness from H., got suspicious, and forced him into a memorable quarrel. After his return home, in 1766, he accepted the responsible office of Under-secretary of State for the Home Department. In his own *Life* he says: 'I returned to Edinburgh in 1769 very

opulent (for I possessed a revenue of £1000 a year), healthy, and, though somewhat stricken in years, with the prospect of enjoying long my ease, and of seeing the increase of my reputation.' Early in 1774, he was attacked with an internal disease, for which he in vain sought a remedy in the Bath waters. He died at Edinburgh on the 25th of August 1776.

HUME, JOSEPH, politician, was born January 1777, at Montrose. His father was the master of a small coasting-vessel, who, dying while his family were young, left his widow and children in narrow circumstances. He was educated in the local schools of Montrose, and at the age of 13 was placed with an apothecary. He studied for the medical profession; was admitted in 1796 a member of the College of Surgeons, Edinburgh; and became assistant-surgeon in the marine service of the East India Company. He applied himself to the acquisition of the native languages, and during the Mahratta war, from 1802 to 1807, filled the office of Persian interpreter to the army. He also discharged duties connected with the prize agencies and the commissariat, and arrived in England in 1808, with an honestly earned fortune of £30,000 or £40,000. He entered the House of Commons in 1812, as M.P. for the borough of Weymouth and Melcombe Regis. The future radical was then of Tory politics, and paid a sum of money for his seat, which he only enjoyed a few months. He obtained, in 1818, a seat for the Aberdeen district of burghs, comprehending his native town of Montrose. In 1830, he had gained such distinction as a radical reformer, that he was returned without opposition as one of the members for Middlesex, which he represented until 1837. In 1842, he was again chosen for his native burgh, Montrose, and remained until his death in the service of his fellow-townsmen. Although by no means a man of brilliant abilities, his indefatigable industry in his parliamentary duties, his plans of reform in every department of church and state, his hatred of sinecures and official abuses of every kind, and his advocacy of economy in the public service, made him one of the most useful and influential members of the legislature. He was probably often wrong-headed and mistaken, and as the leader of the Radical party in the House of Commons, usually found himself in active conflict with both Whig and Tory governments. Yet a tardy but sincere homage was paid to his integrity and public services by the late Sir Robert Peel and other political opponents. He died February 20, 1855, aged 78, leaving a name venerated by the masses of his fellow-countrymen for public honesty and personal disinterestedness.

HUME'TTY, a term in Heraldry, applied to a cross or other ordinary which is cut off, and nowhere reaches the edge of the shield.

HUMIC ACID. See HUMUS.

HUMMELER, an implement or machine used for *humming* barley—that is, removing the awn from the grain after it has been thrashed. A common kind of H. is a set of blunt knives fixed in a frame, with a handle, by means of which they are used in the manner of stamping. Another form consists of blunt knives set on a roller. These implements are worked by the hand. But hummellers of various construction are often attached to thrashing-machines, in all of which blunt knives are made to pass frequently through the grain.

HUMMING-BIRD (*Trochilus*), a Linnæan genus of birds, now constituting a family, *Trochilidae*, of the order *Insessores*, and tribe *Tenuirostres*. The

species are numerous, more than 300 being known, whilst new ones are continually being discovered. They are found only in America and its islands, although represented, both in habits and in brilliancy of plumage, by the Sun-birds (q. v.) of eastern tropical regions. Most of them are tropical, although a few species are summer visitants of the colder parts of America, very seldom, however, seen beyond lat. 57° N.; whilst some of those found only within the tropics inhabit elevated mountainous tracts, even to the confines of perpetual snow. The dazzling brilliancy of humming-birds, the extreme rapidity with which they dart through the air, their hovering above the flowers from which they obtain their food, with humming sound of wings, which move so quickly as to be indistinctly visible, or 'like a mist,' have attracted universal admiration since the first discovery of America. The diminutive size of almost all of them—some of them being the smallest of birds, and if stripped of their feathers, not larger than a humble-bee—has still further contributed to render them objects of interest, whilst the plumage of the different species exhibits an almost endless variety of forms, as well as of colours, in crests, neck-tufts, leg-tufts, and many an extraordinary development of tail.

Humming-birds have slender bills, which are also generally long, and in some extremely so, the form of the bill exhibiting a wonderful adaptation to the kind of flowers from which the bird obtains its food—straight in some, curved in others. Humming-birds do not, as was long supposed, feed on honey alone, but to a considerable extent, and some of them perhaps chiefly, on insects, not rejecting

Humming-Bird and Nest.

spiders, whilst they often snatch away the insects which have become entangled in spiders' webs. The lower mandible fits into the upper, and the bill is thus adapted as a tube for sucking, in which, as well as in seizing small insects within the recesses of flowers, the tongue is also a very efficient organ. The tongue is very long, capable of being darted out to a considerable length; the bone of the tongue (*hyoid bone*) being much elongated, and its branches passing round the back of the skull to the forehead, where they meet in a point before the line of the eyes. The tongue itself consists of two filaments, joined together for the greater part of their length, and separated at the tip. The wings of

humming-birds are very long and powerful, the first quill-feather the longest, and the rest shorter in succession. Humming-birds construct their nests with nice art, generally of lichens and of fibrous substances, such as cotton. They do not lay more than two eggs. They are very bold in defence of their nests and young, and are said to strike fearlessly with their needle-like bills at the eyes of birds of prey, which they far surpass in agility and rapidity of flight. They are very easily tamed and rendered familiar, and have been known to return again in spring, after a winter migration to a warmer climate, to the window from which they had been allowed to escape. Attempts to keep tamed humming-birds have generally failed, perhaps on account of their being supposed capable of feeding only on honey or syrup, whereas insect food seems necessary for them. Attempts made to bring them across the Atlantic have, in the great majority of cases, been unsuccessful.

We cannot propose to describe any of the species of H., nor to give the characters of the numerous genera into which the family has been divided. Form alone without colour is insufficient to convey a proper idea of their metallic and gem-like splendour, which in many cases varies with every change of position and of light.

The Ruby-throated H. (*Trochilus colubris*) is the only species found in the Northern Atlantic states of North America. It ventures even into the regions of the Hudson's Bay Company.

The skins of humming-birds were employed for ornamental purposes by the more civilised American races before the discovery of America by Europeans, and were used by the Mexicans for making those pictures which so much attracted the admiration of their Spanish conquerors.

A full description, with many exquisitely coloured engravings, will be found in the *Histoire Naturelle des Oiseaux-Mouches* par R. P. Lesson, Paris, 1829.

HUMORAL PATHOLOGY. See MEDICINE.

HUMUS is a generic term applied to a group of closely allied substances, which collectively form the organic matter of the soil. These substances may be divided into three great classes: 1. Such as are soluble in water—crenic, apocrenic, and ulmic acids; 2. Such as are soluble in alkaline solutions, but not in pure water—humic and geic acids; 3. Such as are insoluble in all menstrua—humin and ulmin.

All of these are amorphous, ranging in colour from a brownish yellow to a blackish brown, and non-volatile; they are probably all composed of carbon, hydrogen, and oxygen, and they are all remarkable for their power of fixing ammonia. 'They are all products of the decomposition of vegetable matters in the soil, and are formed during their decay by a succession of changes, which may be easily traced by observing the course of events, when a piece of wood, or any other vegetable substance, is exposed for a length of time to air and moisture. It is then found gradually to disintegrate with the evolution of carbonic acid, acquiring first a brown, and finally a black colour. At one particular stage of the process, it is converted into one or other of two substances, called humin and ulmin, both insoluble in alkalies, and apparently identical with the insoluble humus of the soil; but when the decomposition is more advanced, the products become soluble in alkalies, and then contain humic, ulmic, and geic acids; and finally, by a still further progress, crenic and apocrenic acids are formed, as the result of an oxidation occurring at certain periods of the decay.'—Anderson's *Agricultural Chemistry*, 1860, p. 22.

The roots and other vegetable matters remaining in the soil gradually undergo the changes which have been described in the preceding extract, and are thus converted into humus, which is found only in the surface soil, in which its quantity varies with the activity and profusion of the vegetation.

Numerous analyses of the humus compounds have been made, but, as might be expected from the gradual passage of one substance into another, they present considerable discrepancies. According to Mulder, who is perhaps the highest authority on this subject, geic acid is represented by $C_{40}H_{12}O_{14}$; humic acid, by $C_{40}H_{12}O_{12}$; ulmic acid, by $C_{40}H_{14}O_{12}$; crenic acid, by $3HO, C_{24}H_{12}O_{10}$; apocrenic acid, by $2HO, C_{48}H_{12}O_{24}$. Crenic and apocrenic acids (which derive their names from *crenē*, the Greek word for a *spring*) not only occur in combination with ammonia, in the organic matter of the soil, but are likewise found in many mineral waters, and in the ochry deposits that accumulate round the margins of chalybeate springs.

All the above-named substances closely resemble in their composition the woody fibre or cellulose ($C_{24}H_{21}O_{21}$), from which they are derived by a slow process of oxidation.

Chemists hold very different opinions regarding the physiological value of humus. The earlier chemists, and Mulder at the present day, regard it as the almost (if not quite) exclusive source of the organic constituents of plants; while Liebig and the great majority of the chemists of the present day regard the atmosphere (which consists of a mixture of nitrogen and oxygen gases, watery vapour, carbonic and nitric acids, and ammonia) as capable of affording an abundant supply of all these substances. The latter is probably the more correct view; but although humus is not a direct source of the organic constituents of plants, and is not absorbed by their roots, as was formerly supposed, it is so indirectly in at least two modes—viz., by evolving during its decomposition a certain quantity of carbonic acid which can be absorbed, and by its power of absorbing and combining with ammonia, and with certain soluble inorganic constituents of plants. Its power of absorbing ammonia is readily shewn by pouring some ammoniacal solution on peat (which contains the humus compounds in great abundance); the pungent smell at once disappears, which is an evidence that combination has taken place. It possesses a similar but less marked power in reference to potash, soda, lime, and magnesia, and thus plays an important part in preventing these substances from being washed out of the soil. The physical properties of humus are also of great importance in relation to the fertility of the soil. Humus is one of the most highly hygrometrical substances known. While silicious sand absorbs only one-fourth of its weight of water, and again gives off, in the course of four hours, four-fifths of its water, humus imbibes nearly twice its weight of water, and retains nine-tenths of it after four hours' exposure. It thus confers on the soil the power of absorbing and retaining water, and thus diminishes its tenacity, and allows of its being more easily worked; and additionally, from its dark colour, it causes the more rapid absorption of heat from the sun's rays. Hence, although not contributing directly to the food of plants, it is in moderate quantity an indispensable constituent of a fertile soil. The best wheat-bearing soils contain 9 or 10 per cent. of humus compounds.

HU-NAN, a province in the lake district of China, on the south side of Tung-ting-hu, the largest lake in China. It is a fertile region, yielding two crops of rice annually, while its mountains yield malachite,

iron, lead, and coal. Area, 74,320 square miles; pop. 18,652,507. Its capital is Chang-sha-fu, situated on the river Siang.

HUNDRED, in English Law, an ancient subdivision of counties, the origin of which is not very clearly settled, though probably the name arose from there being a hundred sureties in each to keep the peace. In ancient times, if a crime was committed, such as robbery, maiming of cattle, burning of stacks, &c., the hundred had to make it good. The old distinctions have, however, now less significance. But the characteristic of a hundred is still this, that it has a constable or bailiff, and when any damage is done by rioters feloniously destroying property, the individual owner has his remedy by suing the hundred for the damage. In order to secure this remedy, the party or his servant must, within seven days, go before a justice, and state on oath the names of the offenders, and engage to prosecute them. So, where there is no hundred, the county, or city, or town, is liable in like manner, and in all cases the expenses are paid by the county rate, or a rate in the nature of a county rate. In the northern counties, a hundred is generally called a wapentake. The act 7 and 8 Geo. IV. c. 31, giving the above remedy against the hundred, does not extend to Scotland. See RIOR.

HUNDREDERS, inhabitants of a Hundred (q. v.).

HUNGARY (Ger. *Ungarn*; Magyar, *Magyar Ország* (Land of the Magyars); Slav. *Vengria*), a portion of the Austrian empire. According to the fundamental laws of the realm, the emperors of Austria are kings of Hungary, which formerly comprehended Hungary proper, Croatia, Slavonia, Dalmatia, the Illyrian sea-coast, Transylvania, and the whole of the military frontier. After 1848, these pendicles were dissociated administratively from Hungary proper and converted into crown lands. Since 1867, Hungary, Croatia, Slavonia, Transylvania, and the Military Frontiers, have constituted the kingdom of Hungary, one member of the bipartite empire. The two knots which tie Austria proper and Hungary together are the person of their common sovereign and the 'Delegations'—a parliament consisting of 120 members, of which 60 are supplied by either portion of the empire. This body legislates for war, finance, and foreign affairs; and the ministers of these three departments are responsible to it, or to a committee of its members. Hungary has an area of 117,600 English square miles, with, in 1870, a population, civil and military, of 15,509,455. The general features of the country are given under the article **AUSTRIA** (q. v.), to which may be added that the soil of the vast plains consists chiefly of humus and clay, and is of an extraordinary fertility. Huge tracts of sand are to be found in several parts; there are also swamps all along the Theiss, but both of these are rapidly diminishing, in consequence of works carried on with great energy and perseverance. The level tracts in the eastern part of H. are subjected to periodical drought, and to frequently recurring blasts. Hailstorms during summer, and the severity of cold during winter, cause much anxiety to farmers, and more especially to the numerous class of vine-growers. In regions where people neglect taking proper care, ague is common; although, according to Bendant, the climate of H., on the whole, is to be regarded as healthful, and favourable not only to physical strength, but also to intellectual development.

H. is an agricultural country, in the strictest sense of the word. According to Fényes, the land under cultivation in 1840 was as follows in the kingdom

(with the exception of Transylvania and of the Military Frontier):

	English Acres.
Soil under tillage,	17,337,437
Meadows,	4,636,113
Pasture,	7,968,922
Vineyards,	1,456,748
Farm-yards and gardens,	583,241
Forests,	15,681,887

In the statistical returns of Baron Czernign, published by the Austrian government in 1858, the soil under tillage (Transylvania included) is estimated at 22,651,438, and the pasture-land at 5,662,299 English acres. The difference arises chiefly from two circumstances: 1. By confining the river Tisza to its proper channel, new tracts of land came under cultivation. 2. By the parcelling out of grounds upon the principle of modern farming, communal pastures became private property in many places, and were thus converted into soil under tillage. Agriculture in H. is rapidly improving, as the great landed proprietors are enabled to introduce English machinery upon their estates, the great extent of level ground being admirably adapted for the use of such implements. According to reliable calculation, the annual produce, in grains of every kind, amounts to 239,352,900 imperial bushels, leaving a yearly surplus for exportation of no less than 60,500,000 imperial bushels, of which more than one-half is wheat of first-rate quality. The mineral wealth of H. may be said to be inexhaustible, but several branches of mining are as yet in their infancy. In 1858, the mineral produce was, in gold, 44,000 oz.; silver, 48,000 oz.; quicksilver, 6300 cwts.; lead, 27,000 cwts.; copper, 36,750 cwts.; pig-iron, 1,575,000 cwts.; coals, black, 3,780,000 cwts.; coals, brown, 3,570,000 cwts. Rock-salt may be had to any amount in the mountains of Marmaros, as also in Transylvania. The quantity of wine is such that it might suffice for supplying the half of Europe. For the dessert-table, Tokay, Ménes, and Ruszt yield their delicious liquor, obtained from dry grapes. The red wines of Eger (Erlau), Buda (Ofen), Visonta, Karlovitz, Szegzárd, &c., may be said to equal the best produce of Burgundy; while the white wines of Magyarát, Neszmély, Somlyó, Pesth, Villány, Monoszló, &c., rank with the choicest of Rhenish wines. Tobacco, hemp, flax, rape seed, timber of every variety, would be extensively exported were the means of communication developed, and commercial intercourse guided by a more liberal policy. Fényes put down the number of horses before 1848 at 1,200,000; since that time the breeding has much improved. The oxen of H. excel equally in size and in the nourishing quality of the meat they yield. The number of sheep, according to Fényes, was 17,000,000, yielding an average quantity of wool yearly of 360,000 cwts., more than the half of which is above the average in quality. Among the 4,000,000 of swine, the Mangalica breed is much praised for its size, and for the hardness of the lard it yields. The rearing of bees and of the silk-worm is chiefly carried on in the Military Frontier. Industry and commerce are far from being at a level either with the wants of the people or with the natural richness of the soil; nevertheless, great progress has been made; thus Pesth, the capital of H., has been brought into direct railway connection, not only with Vienna, but with Trieste, Temesvár, Arad, Debreczin, and Kassa. A main line has been carried through Transylvania. Fiume, was next drawn into the net, so as to render it an outlet for the inexhaustible stores of the Banat, of Slavonia, and Croatia, while the mountain districts of Upper H. have a line extending to the very heart of Galicia.

Public banks, and other establishments of credit, are springing into life, and the fetters that weighed upon industry and commerce are being removed. A sound system of taxation, together with the revival of constitutional rights, would soon do the rest. Public education, especially in its lower branches, is rapidly extending. The colleges are of two kinds—gymnasias for classical education, and schools for industry and commerce. The higher branches of learning are carried on in academies and lyceums, as well as in the richly endowed Roman Catholic university of Pesth. Among the higher educational institutions of the Protestants, those of Debreczin and Sárospatak (for Calvinists), and of Eperjes, Posony, and Soprony (for Lutherans), occupy a very high rank. The Academy of Sciences, the Society of Naturalists, the Agricultural Society, the National Museum and Theatre, the Kiszaludy Society, together with more than 60 periodicals published in the Magyar tongue, speak well for the interest the Hungarian nation takes in progress and civilisation. The following tables shew the ratio of population, according to religion and nationalities, throughout H., Croatia, Slavonia, and Transylvania:

Religion.	Numbers.	Per cent.
Roman Catholics,	7,120,000	48.0
Greek "	1,498,000	10.1
Evangelical Protestants,	3,088,000	20.8
Byzantine Greeks,	2,630,000	17.7
Jews,	428,000	2.9
Unitarians,	54,000	0.3
Other Sects,	11,000	0.1

According to *Die Völkerstimme der Oestreich* of Dr Ficker, published in Vienna in 1869, the numerical strength of the Hungarian monarchy is as follows:

Magyars,	5,408,000
Slavi,	3,719,000
Roumanians,	2,502,000
Servians, 1,765,000 (others, 611,000),	2,376,000

There are, besides, a few thousands of Bulgarians, Montenegrins, French, &c.

At the head of the Roman Catholic Church in H. is the Prince Primate the Archbishop of Esztergom or Gran; there are two other archbishops, and seventeen bishoprics. The Greek Catholics have four bishops; the Non-united Greeks, a patriarch-archbishop and seven bishops. The two Protestant bodies are divided into districts, four for each; the heads of those districts bear the title of Superintendents.

History.—It is generally admitted that the Hungarians—in their own language, Magyars—are of Scythian origin; their ancient seats being in the environs of the Caspian Sea. Part of the people emigrated in the direction of the Ural Mountains, and thence, being pressed by the warlike swarms of Paimacitæ, to the regions now known as Moldavia and the Ukraine. In 889, forty thousand families, counting more than 200,000 warriors among them, left their homes under the leadership of Almos, and after many a hard battle arrived at the north-eastern frontiers of the land, which, under the name of Pannonia, contained several independent realms, such as Great Moravia, the Slavo-Bulgarian kingdom of Zalan, &c. The great task of conquest being now at hand, old Almos resigned, and his son Arpád being unanimously elected as chief, the armed invasion began at once in several directions. At the end of 899, Arpád's sway extended from the Carpathians down to Servia, and from the eastern borders of Transylvania to the foot of the Styrian mountains. According to a covenant between Arpád and the other chiefs, the leadership was to remain with the descendants of the former as long as they should keep faithful to the nation. The

foundations which were then laid for the political organisation of the realm, have been developed through lapse of time into that system of municipal independence which has outlived the storms of nearly a thousand years, and contains, even after the disastrous issue of 1849, the germs of future national greatness. The periods into which the history of H. is divided are: 1. Period of chiefs of the House of Arpád (894—1000); 2. Period of kings of the House of Arpád (1000—1301); 3. Period of kings from different (foreign) families (1301—1526); 4. Period of kings of the House of Hapsburg (1526 to the present day). The first king of H. was Stephen I., called the Saint; he was crowned in the year 1000 with a crown that had been sent to him by the pope, Sylvester II. It forms to-day the upper part of 'the sacred crown of Hungary.'

With St Stephen, a new era began for H.; Christianity took the place of heathen superstitions; the savage incursions, by which the people of the east became a scourge to neighbouring nations, ceased entirely. The House of Arpád gave twenty kings to H., the greatest of whom undoubtedly was Stephen I., who, besides dividing the realm into ten bishoprics, more completely developed the administrative system. Among his successors, Béla I. (1061—1063) distinguished himself by saving the hardly begun Christian civilisation against the rebellious attempt of a numerous party. Ladislaus I. is renowned for wise legislation and for great personal valour. Such was the renown of his deeds, that at the council of Piacenza (1095) he was unanimously elected to be the leader of the crusade to Palestine. Death prevented the hero from accomplishing the task. Coloman (1095—1114) went by the name of 'Learned,' and many of his laws shew how much he was in advance of the age. Gejza II. (1141—1161) was but ten years old when crowned; nevertheless, his reign is worthy of mention, for it was then that colonists from Flanders settled in Northern H., as also in Transylvania, in consequence of which, mining and several branches of industry made rapid progress. Andrew II. (1205—1235) is known in connection with the crusades; the Hungarian Magna Charta (Bulla Aurea), forced from him by his nobles, dates from 1222. Béla IV. (1235—1270) shewed great qualities in subduing the indomitable arrogance of the oligarchy, and in healing the wounds of his people after the terrible invasion of the Mongols in 1242. Andrew III. was the last male scion in the Arpád line; he died without issue in 1301. During the mixed period, two kings, besides the governor Hunyady (q. v.), especially distinguished themselves. Lewis I., called the Great (1342—1381), was the second king from the House of Anjou, being by his great-grandmother connected with the Arpád dynasty. Lewis extended the sway of the Hungarian sceptre to limits formerly unknown; re-established at home the authority of law, trodden down by the mighty oligarchs under his predecessors; and promoted science, industry, and commerce. One of the remarkable episodes of his reign was the expedition to Italy to punish the assassins of his unfortunate brother, Andrew, spouse of the famous Joan of Naples. Sigismund (1387—1437) is better known as Emperor of Germany. As a curious incident in the life of a sovereign, may be mentioned his imprisonment at Siklós during six months. Sigismund was released only after he had taken the oath to his Hungarian subjects, vowing fidelity to the constitution. Mathias I.—better known by the name of Mathias Hunyady or Mathias Corvinus (see MATHIAS)—may be said to have been not only the greatest king of H., but also the greatest sovereign of his age. By his valour, sagacity,

and love of learning, he raised his nation to the pinnacle of fame. From the death of Mathias to the day of Mohács, H. exhibits the fiercest strife of factions—a protracted agony, preceding the loss of national independence. Among the many calamities during the reign of Vladislas II. of Bohemia (1490—1516), the Peasant War occupies a prominent place. Dózsa and his bands, after having committed great havoc, were exterminated by the famous John Zapolya of Transylvania, and the whole of the peasantry reduced to a state of serfdom. Lewis II. was but ten years old at the death of his father, Vladislas II. Another ten years of rapid disorganisation was required to make a disaster like that of Mohács possible. See MOHÁCS, BATTLE OF. The further history of H. is indissolubly connected with that of the Austrian empire, and may be read as to its principal features under the head AUSTRIA.

Fundamental Laws of Hungary.—1. The Golden Bull of Andrew II., given in the year 1222, upon the return of the king from Palestine, contains 31 articles, of which article 2 is a kind of Habeas Corpus Act, but for nobles only. One clause of article 31, declaring armed resistance to any illegal acts of the king not punishable by law, was cancelled by article 4 of the diet in 1687.

2. Treaty of Peace of Vienna, 1606. It was concluded on the 23d of June, between Mathias II. and Stephen Bocskay. Article 1 enacts freedom of worship to Protestants, as far as is consistent with the established rights of the Roman Catholic Church.

3. Treaty of Peace of Linz, enacted during the diet of 1646—1647. Public worship is once more secured to Protestants, such freedom being for the first time extended also to the peasants. Protestants were to be admitted to public functions on an equal footing with Catholics.

4. The Pragmatic Sanction, contained in article 2 of the diet of 1722—1723. In case there should be no male issue in the dynasty of Hapsburg, the females and their descendants are to succeed to the Hungarian throne. The king must be a Roman Catholic, must take oath to the constitution, and sign the so-called *diploma inaugurale*, thus confirming the rights and privileges of the nation. Should there be no descendant, male or female, of the reigning House, the freedom of electing their king belongs to the nation.

Article 11 of 1741. Maria Theresa, abandoned by her allies, surrounded on all sides by fearful dangers, won the love of the Hungarian nation by acceding to their just and legitimate claims. The government of H. was confided to Hungarians only; in public affairs, the Primate, the Palatine, and the Ban were to be consulted. Hungarians were to be eligible for seats in the ministry. Article 17 of 1790—1791 renews those enactments.

Article 10 of 1790—1791 establishes the independence of the Hungarian kingdom with its annexed parts. Article 12 of the same year declares that the power of making, changing, and interpreting laws in the kingdom of H. belongs to the sovereign legitimately crowned, together with the diet legally convened. Nothing can be done in H. by means of royal letters patent. Article 13 orders that the diet shall be convoked at least once every three years.

Article 16 guarantees the nation the use and culture of the Magyar tongue.

Article 19 secures to the diet the right of voting taxes and of fixing the number of recruits.

Up to the year 1848, the nobles were free from contribution and military service; they occasionally gave subsidies; and in case of extreme necessity, rose in arms for the defence of the country. Article

8 of 1847—1848 enacts the great principle, that all classes are to participate in the public burdens of the realm. Article 9 abolishes statute labour; the peasant could henceforward become owner of real property; and indemnity was given to their former masters. Article 5 of 1847—1848 establishes the principle of popular representation upon the basis of taxation.

The legislative power in Hungary is intrusted to the king and the Reichstag or Diet, which consists of the House of Magnates and the House of Representatives. In 1872, the former assembly counted 410 members—3 princes, 31 archbishops and bishops of the Roman Catholic and Greek churches, 371 nobles of Hungary, 2 deputies from Croatia and Slavonia, and 3 from Transylvania. The lower House is composed of representatives of the towns and rural districts. It is elected by the votes of all citizens of age who pay direct taxes to the amount of 16s. a year. Neither electors nor their representatives are affected by any distinction of race or religion. In the session of 1872, there were 438 members. The towns and cities of Hungary sent 88 deputies, or rather delegates; from country districts, 289; 29 from Croatia and Slavonia; and returned by ecclesiastical and other bodies, 32.

Hungarian Language and Literature.—Notwithstanding the general sympathy that prevails for H., many are of opinion either that the Hungarians are but a half-civilised people, or that their language and literature are in some sense or another Germanic or Slavonic. The Magyar tongue is as much distinct from German or Slave as is the French or Italian. The language of the Hungarians is called Magyar, and forms, together with the Mogul, the group Ugri, belonging to the great Finnic family. As to its syntax, the language is nearest to the Turkish. Among its characteristics may be noted that the Christian name occupies always the second place, as, for instance, Hunyady János = John Hunyady. How rich in expressions, how abundant in classic beauties that language is, may be collected from the circumstance, that although it was excluded from public life during eight centuries (Latin being used in schools, legislation, and administration), H. possesses to-day a literature which, both in regard to its quantity and quality, will sustain a comparison with that of the most civilised among the western nations. Especially as regards poetry, the names of Kisfaludy, Vorösmasty, Pesöfi, Arany, &c., are well worthy of being ranked with the best in other lands. Those who are desirous of further information on this interesting subject, should consult Toldy's admirable *Handbook of Hungarian Literature*, published both in Magyar and German.

HUNGARY-WATER, a very celebrated perfume, for the preparation of which various receipts have been given. The following is one of the best: Take of fresh rosemary in blossom, 4 pounds; fresh sage in blossom, 6 ounces; ginger in slices, 2 ounces; cut them in small pieces, mix, and add rectified spirit 12 pounds, and common water 2 pints. Let eleven pints distil by a gentle heat. A hermit is said to have given the original receipt to a queen of Hungary, and hence it was called the *Queen of Hungary's Water*, which has been abbreviated into Hungary Water. It is employed principally as a perfume for the toilet; but it is sometimes taken internally as a restorative and stimulant, and it may be used externally as a gently stimulating liniment.

HUNGER. See DIGESTION.

HUNINGUE, a small town of France, in the department of Haut-Rhin, is situated on the left

bank of the Rhine, 37 miles south-south-east of the town of Colmar. Pop. about 2000.

This place is remarkable as being the centre of the French system of pisciculture, or fish-breeding. A series of buildings and artificial ponds, covering a space of seventy imperial acres, were erected in 1852–1854 for the breeding and acclimatising of foreign fish. The total cost was £10,607. The expense of carrying on the plan from 1853 to 1862 amounted to £13,887, and the annual cost is now averaged at about £2000. This establishment has enabled the French government to restock many of the barren rivers of France with valuable fish. See PISCICULTURE.

HUNS (Lat. *Hunni*; Gr. *Ounnoi* and *Chounoi*), the name of a considerable nation of antiquity, which, from time to time, made incursions upon the Roman dominions, and which eventually, under Attila, the most renowned of its leaders, brought the empires of both the East and the West to the very verge of destruction.

The H. were of Asiatic origin, and, in all probability, of the Mongolian or Tartar stock; therefore akin to, and perhaps to be identified with, the Scythians and Turks. According to De Guignes, whose theory has been accepted by Gibbon, the H. who invaded the Roman empire were lineally descended from the Hiong-nou, whose ancient seat was an extensive but barren tract of country immediately to the north of the great wall of China. About the year 200 B.C., these people overran the Chinese empire, defeated the Chinese armies in numerous engagements, and even drove the Emperor Kao-ti himself to an ignominious capitulation and treaty. During the reign of Vou-ti (141–87 B.C.) the power of the H. was very much broken. Eventually, they separated into two distinct camps, one of which, amounting to about 50,000 families, went southwards, while the other endeavoured to maintain itself in its original seat. This, however, it was very difficult for them to do; and eventually the most warlike and enterprising went west and north-west in search of new homes. Of those that went north-west, a large number established themselves for a while on the banks of the Volga. Then crossing this river, they advanced into the territories of the Alani, a pastoral people dwelling between the Volga and the Don. At what period this took place is uncertain, but probably it was early in the 4th century. The Alani, who had long dwelt in these plains, resisted the incursions of the H. with much bravery and some effect, until at length a bloody and decisive battle was fought on the banks of the Don, in which the Alan king was slain, and his army utterly routed; the vast majority of the survivors joined the invaders.

The H. are described as being of a dark complexion, almost black; deformed in their appearance, of uncouth gesture, and shrill voice. 'They were distinguished,' says Gibbon, 'from the rest of the human species by their broad shoulders, flat noses, and small black eyes deeply buried in the head; and as they were almost destitute of beards, they never enjoyed either the manly graces of youth, or the venerable aspect of age. A fabulous origin was assigned worthy of their form and manners—that the witches of Scythia, who for their foul and deadly practices had been driven from society, had copulated in the desert with infernal spirits; and that the H. were the offspring of this execrable conjunction.' Such was the origin assigned to them by their enemies the Goths, whom the H. now invaded with fire and sword. Hermanric, the aged sovereign of the Goths, whose dominions reached from the Baltic to the Euxine, roused himself to meet the invaders, but in vain. His successor,

Withimir, encountered the H. in a pitched battle, in which he was himself slain, and his countrymen utterly routed. These now threw themselves upon the protection of the Emperor Valens, who in 376 gave permission to a great number of them to cross the Danube and settle in the countries on the other side as auxiliaries to the Roman arms against further invasion. The H. now occupied all the territories that had been abandoned by the Goths; and when these, not long afterwards, revolted against Valens, the H. also crossed the Danube, and joined their arms to those of the Goths in hostilities against the Roman empire. In the wars that followed, the H. were not so conspicuous as the Goths their former enemies. Indeed, we now hear but little of the H. during the remainder of the 4th century. It is supposed, however, that early in the following century they were joined by fresh hordes of their brethren, a circumstance which encouraged them to press onward towards further conquests. In the reign of Theodosius the younger, they had increased so considerably in power, that their sovereign Rugilas, or Roas, was paid an annual tribute to secure the Roman empire from further injury.

Rugilas, dying in the year 434, was succeeded in the sovereignty of the H. by his nephews Attila (q. v.) and Bleda. With Attila's death, however, in 454, the power of the H. was broken in pieces. A few feeble sovereigns succeeded to him, but there was strife now everywhere among the several nations that had owned the firm sway of Attila, and the Huns especially never regained their power. Many of them took service in the armies of the Romans, and others again joined fresh hordes of invaders from the north and east, aiding them in their repeated attacks upon the moribund Roman empire.

HUNT, JAMES HENRY LEIGH, poet and essayist, was born in London, 19th October 1784, educated at Christ's Hospital, and first attracted notice as a writer of theatrical and literary criticisms for the *Examiner* newspaper, which was started in 1805 by his elder brother John. At the age of twenty-four, he became joint editor and proprietor of the *Examiner*. He was a liberal in politics before liberalism had become fashionable; and for one of his articles, reflecting on the obesity of the Prince Regent—'a fat Adonis of fifty,' H. had called him—he was sentenced to pay a fine of £500, and to undergo two years' imprisonment. H. was happy enough in his confinement; he hid the prisoners with flowers, and received visits from Byron, Shelley, and Keats. On his release, he published *The Story of Rimini*, which he had written in prison, and which gave him a place among the poets of the day. *Foliage*, appeared in 1818, and about the same time he started the *Indicator*, a serial suggested by the *Spectator* and *Tatler*. In 1828, he published *Lord Byron and his Contemporaries*, the record of a brief and not very pleasant companionship in Italy with his lordship, which gave great offence to Byron's friends. In the same year he started *The Companion*, a sequel to *The Indicator*, both of which were republished as one book in 1834. In 1833, he published a collected edition of his poetical works. In 1834, he started the *London Journal*, which he edited for two years. His principal works, besides those already mentioned, are—*Captain Sword and Captain Pen* (1835); *Legend of Florence* (1840); *The Seer*, a publication similar to *The Indicator*; *The Palfrey* (1842); *Sir Ralph Esher*, a novel (1844); *Imagination and Fancy* (1844); *Wit and Humour* (1846); *Stories of the Italian Poets, with Lives* (1846); *Men, Women, and Books* (1847); *A Jar of Honey from Mount*

Hybla (1848); his *Autobiography* (1850); *The Religion of the Heart* (1853); and *The Old Court Suburb* (1855). In 1847 he received from the crown a pension of £200. He died at Highgate, August 28, 1859. A selection from his *Letters and Correspondence* was published by his son, Mr Thornton Hunt, in 1862.

H.'s reputation rests upon his poems and essays. *The Story of Rimini* is, on the whole, perhaps, the finest narrative which has appeared since Dryden, and his *Palfrey* is delightful from its good spirits and bright sunny glimpses of landscape and character. As an essayist, he is always cheerful and fanciful, and he looks determinedly at the bright side of things. The sky may be gloomy, but if there is a bit of blue in it, he, with an admirable practical philosophy, constantly turns his eye to that. He delights to wreath the porch of the human dwelling with roses and honeysuckles. Among his poems are to be found several translations, which are the best things of the kind we possess. He transports the wine of Greece and Italy to England, and its colour and flavour are rather improved than otherwise by the voyage.

HUNT, WILLIAM HOLMAN, a celebrated English painter of the present day, was born in London in 1827, and exhibited his first picture, entitled 'Hark!' in 1846. During the next few years, his reputation steadily advanced; but while the young artist was winning fame, he was at the same time becoming more and more dissatisfied with the principles and practices that ruled his art, and along with Millais, Rossetti, and other young painters who shared his convictions, he commenced a new style of treatment, known as the *Pre-Raphaelite*. This term was originated by H. and his friends, and was employed by them to indicate their predilection for the painters who lived before Raphael, such as Giotto and Fra Angelico, but did not at all imply that they meant to take the productions of these masters as technical models. It was because of their truthfulness and earnest simplicity that they professed to admire the antique fathers of Italian art. The first of H.'s works that shewed the new influence, was his 'Converted British Family sheltering a Christian Missionary from the Persecution of the Druids' (1850). He afterwards produced, among others, 'Valentine rescuing Sylvia from Proteus,' 'The Hiring Shepherd,' 'Our English Coasts,' 'The Awakened Conscience,' 'The Light of the World,' 'The Scape Goat,' and 'Christ Disputing with the Doctors in the Temple.' Of these, the last three are unquestionably H.'s greatest; and multitudes of people, who neither understand, nor care to understand the *vezata questio* of Pre-Raphaelitism, have been profoundly moved by the tenderness, purity, strength, and truth of religious sentiment by which they are inspired. H. died Feb. 1864.

HUNT, WILLIAM, an eminent English painter in water-colours, was born in London in 1790. He ranks very high in his profession, no less an authority than Mr Ruskin pronouncing him to be among the greatest colourists of the English school. His subjects are very simple—'Peaches and Grapes,' 'Old Pollard,' 'Basket of Plums,' 'Roses,' 'Wild Flowers,' 'Trampers at Home,' 'A Farmhouse Beauty,' 'Fast Asleep,' &c., but they are conceived in a finely poetical spirit, and present the perfection of finish.

HUNTER, JOHN, the greatest name in the combined character of physiologist and surgeon that the whole annals of medicine can furnish, was born at Long Calderwood, in Lanarkshire, in 1728, and was the youngest of ten children. One of his brothers, William, claims a separate

notice. One of his sisters, Dorothea, was married to Dr James Baillie, professor of divinity in the university of Glasgow, and was the mother of Matthew Baillie (q. v.), and Joanna Baillie (q. v.). The fact that his father died when H. was only ten years of age, and the probability that he was over-indulged by his mother, explain how, at the age of twenty, he could simply read and write, and was ignorant of every language besides his own. The fame of his brother William's success as an anatomical lecturer, made H. desirous of entering into the same profession, and he accordingly applied for and obtained the situation of assistant in the dissecting-room. His progress in anatomy and surgery was so rapid, that in the second session he was able to undertake the directing of the pupils in their dissections. He studied surgery under Cheselden (the celebrated lithotomist), at Chelsea Hospital, during the summer months of 1749 and 1750; and subsequently under Pott.

In 1753, H. entered as a gentleman commoner at St Mary's Hall, Oxford; but finally deciding on confining himself to the practice of surgery, he entered St George's Hospital as surgeon's-pupil in 1754, and two years afterwards served the office of house-surgeon. In the course of this year (1754), H. became a partner with his brother in the anatomical school. After ten years' hard work in the dissecting-room, his health began to give way, and in 1759 he was strongly advised to seek a more southerly climate. With this view he applied for an appointment in the army, was immediately made staff-surgeon, and sent out to Belleisle, and afterwards to the Peninsula; but in 1763, peace having been proclaimed, he returned home, permanently settled in London, and with nothing but his half-pay and his own talents to support him started as a pure surgeon. For a while he had not a great practice, and consequently devoted much time and money to comparative anatomy. He was in the habit of purchasing the bodies of animals that died in the Tower, and in travelling menageries; and in order conveniently to carry on his anatomical and physiological inquiries, he purchased a piece of ground at Earl's Court, Brompton, where he built a small house, in which he made most of his researches. In 1767, he was elected a Fellow of the Royal Society, and in the following year was appointed surgeon to St George's Hospital. This appointment led to an increase of his practice, and enabled him to take pupils, each of whom paid him 500 guineas. Jenner (q. v.) was one of the earliest of these, and always spoke of his old master in terms of regard and affection. In 1771, he married Miss Home, sister of Mr (afterwards Sir Everard) Home.* His practice at this time was increasing rapidly, but his income never reached £1000 a year until 1774. In 1773, he had the first attack of a disease (*angina pectoris*) which ultimately proved fatal. In 1776, he was appointed surgeon-extraordinary to the king.

In 1783, he determined to build a museum. The building, which was completed in 1785, consisted of an upper room for the reception of his collection, 52 feet long by 28 wide, under which were a lecture-room, and another room which became the place of meeting of the Lyceum Medicum, a society established by H. and Fordyce. It was in December of that year that he planned and carried into execution his famous operation for the cure of aneurism—that of simply tying the artery at a distance from

* Mrs Hunter had a taste for music, and was the author of several popular songs. *My Mother bids me bind my Hair* is one of hers, and was written to an air of Playdell's.

the tumour, and between it and the heart, thus introducing into surgery an improvement which has been more fruitful in important results than any since Ambrose Paré's application of ligatures to divided arteries. In 1786, H. was appointed deputy-surgeon-general to the army; in 1787, he received the Copley medal from the Royal Society. He was now universally acknowledged, by all the younger surgeons, as the head of his profession; but most of his contemporaries looked upon him as little better than an innovator and an enthusiast. He died 16th October 1793, and was buried in the church of St Martin's-in-the-Fields, from whence his remains were removed, in 1860, to Westminster Abbey, where a suitable tablet to his memory has been erected by the Council of the Royal College of Surgeons.

Some idea may be formed of H.'s extreme diligence, by the fact that his museum contained at the time of his death 10,563 specimens and preparations illustrative of human and comparative anatomy, physiology, pathology, and natural history. He died in comparative poverty, and his collection was purchased, two years after his death, by government for £15,000, and was presented to the Royal College of Surgeons, by whom it has been much enlarged.

In addition to numerous papers contributed to the *Transactions* of the Royal and other learned societies, he published the following independent works: *A Treatise on the Natural History of the Human Teeth* (part i. 1771; part ii. 1778); *A Treatise on the Venereal Disease* (1786); *Observations on Certain Parts of the Animal Economy* (1786); and *A Treatise on the Blood, Inflammation, and Gunshot Wounds* (published in 1794). Mr Palmer, with the literary assistance of several eminent surgical friends, published an excellent edition of *The Works of John Hunter, F.R.S., with Notes*, in 4 volumes, in 1835. To this is prefixed *The Life of John Hunter, F.R.S.*, by Drewry Otley, from which most of the materials of this sketch have been taken.

HUNTER, WILLIAM, M.D., the elder brother of John Hunter, was born at Long Calderwood, in the parish of Kilbride, Lanarkshire, in 1718, and died in London in 1783. After studying for five sessions in the university of Glasgow, with a view to entering the church, he determined to devote himself to the profession of physic. He passed the winter session 1740—1741 in Edinburgh, and in the summer of 1741 arrived in London, where he resided with Dr James Douglas, the well-known anatomist and obstetric physician, for the double purpose of assisting in dissections, and superintending the education of his son. H. was then entered as a surgeon's pupil of St George's Hospital, and as a dissecting pupil of Dr Frank Nicholls, who was then teaching anatomy with great success. To teach anatomy was now the object of his ambition, and in 1746 an opportunity of doing so occurred. A society of naval surgeons had for several years engaged Mr Sharpe to deliver a course of lectures on the operations of surgery, and on his resignation, H. received the appointment. He gave so much satisfaction, that the society requested him to extend his plan to anatomy. In 1747, H. was admitted a member of the Corporation of Surgeons. In the early part of his career, he practised both surgery and midwifery, but he gradually confined himself to the latter line of practice. He was appointed one of the surgeons-accoucheur to the Middlesex Hospital in 1748, and to the British Lying-in Hospital in 1749.

In 1762, H. was consulted by Queen Charlotte, and two years afterwards was appointed physician-extraordinary to her majesty. In 1767, H. was elected a Fellow of the Royal Society, and in the

following year was appointed professor of anatomy to the Royal Academy. In 1770, he removed to Great Windmill Street, where he had built a house, in connection with which were a roomy amphitheatre for lectures, a dissecting-room, and a magnificent room which was to form his museum, which consisted of anatomical preparations executed by himself and his pupils, purchases from other museums, also minerals, shells, and other objects of natural history, together with a very rare cabinet of ancient medals and coins.

The estrangement which took place between H. and his brother continued till the former was on his death-bed, when his brother requested that he might be admitted to see him. This was acceded to, and he continued to visit him daily, and to afford him professional assistance, until his death. Together with the bulk of his fortune, H. left his museum to Dr Baillie for a period of thirty years, after which it was to be handed over to the university of Glasgow, to which institution he bequeathed £8000 for its maintenance and increase.

H. excelled as a lecturer in clearness of arrangement, aptness of illustration, and elegance of diction. 'He was, perhaps, the best teacher of anatomy that ever lived.' He published several important contributions to medicine, of which the most important is his *Anatomical Description of the Human Gravid Uterus and its Contents*, which did not appear in its perfect form till after his death.

HUNTER, the name of a river in New South Wales, which enters the Pacific 75 miles north of Sydney.

HUNTING HORN, or BUGLE HORN, is a frequent bearing in Heraldry. When adorned with rings, it is said to be garnished. If the mouth and strings of the instrument are of a different tincture from the horn, this must be named in blazon.

HUNTINGDON, a market-town and parliamentary and municipal borough of England, capital of the county of the same name, is situated on the left bank of the Ouse, 20 miles west-north-west of Cambridge, and 60 miles north of London. Among the most interesting buildings is the house of Oliver Cromwell, still called Cromwell House. H. contains numerous schools, among which is the grammar-school, with an endowment of £100 a year, and two exhibitions for Cambridge University. Manufactures of bricks and tiles are here carried on. Pop. in 1861, of municipal borough, 3816; of parliamentary borough, 6254. (1871—4242, and 6605.)

HUNTINGDON, SELINA, COUNTESS OF, celebrated in the religious history of the 18th c., was the second of three daughters and co-heiresses of Washington Shirley, second Earl Ferrars, and was born August 24, 1707. She married, in 1728, Theophilus, 9th Earl of Huntingdon, a very pious nobleman, and became a widow in October 1746. Adopting the principles of the Calvinistic Methodists, the founder of which sect was the famous George Whitefield, she made that eminent preacher one of her chaplains, and assumed a leadership among his followers, who came to be known as 'The Countess of Huntingdon's Connection.' On Whitefield's death in 1770, she was appointed by his will sole proprietrix of all his possessions in the province of Georgia, on which she immediately set about organising a mission to North America. Her labours at home increased with her years. For the

Hunting Horn.

education of ministers, she established and maintained a college at Trevecca, in Wales; removed, in 1792, to Cheshunt, Herts; and built, or became possessed of, numerous chapels in different parts of the country, the principal one being at Bath. She likewise expended large sums in the support of young men trained to itinerant preaching, as well as in private charity. But with all her excellences, she was not indisposed to play the part of a female pope, and had quite a passion for carrying her point. She died June 17, 1791. By her will, dated January 11, 1790, she created a trust, bequeathing her chapels to four persons, of whom Lady Anne Erskine, a daughter of the Earl of Buchan, was one, for their care and management after her death, when the number amounted to 64. Most of them have become, in doctrine and practice, almost identical with the Congregational or Independent body. In 1851, there were 109 chapels belonging to this connection in England and Wales.

HUNTINGDONSHIRE, a small inland county of England, is bounded on the E. by Cambridgeshire, on the S. by Bedfordshire, and on the W. and N. by the county of Northampton. Area, 229,544 acres, almost the whole of which is in arable or pasture lands. Pop. (1861) 64,250. It is watered chiefly by the Ouse, which flows north-east through the south part of the county; and by the Nene, which skirts its northern boundary. In the southern districts the surface is diversified by low hills; the northern portion of H., however, is included in the great fen-country. The soil is various; clay, however, predominates generally. Grain, with beans, rape, and clover are the chief crops. The county returns two members to the imperial parliament.

The county of H. was traversed by two Roman roads, and Roman remains, as coins, pottery, &c., have been found. (1871—pop. 63,672.)

HUNTLY, a small burgh of barony and market-town of Scotland, in the north-west of Aberdeenshire, situated at the junction of the Bogie and the Deveron, 20 miles south-south-west of Banff. In the vicinity is the ruin of Huntly Castle. Pop. (1861) 3448. (1871—3570.)

HUNTSVILLE, a village in Northern Alabama, on the Memphis and Charleston Railway, United States of America, 10 miles north of the Tennessee River. It has the usual county buildings, and a large trade in cotton and imported goods with the surrounding country. Pop. about 5000.

HUNYADY, JÁNOS (Eng. John), governor of Hungary, one of the greatest captains of his age, was born towards the close of the 14th century. H.'s origin is wrapped in mystery, the most accredited legend being that he was a son of the Emperor Sigismund by a Wallachian lady. H. and his descendants had in their escutcheon a raven—*corvus*—hence the designation of Corvinus. We find H. as Ban of a province south of the Danube, distinguishing himself against the Turks, who at that time were the terror of the whole of Christendom. During the period 1437—1456, H. was the shield of Hungary, not only against external foes, but also against the lawless attempts of the nobles. Such was the renown of H.'s arms, that, after the campaign of 1444, the Turks were glad to obtain an armistice of ten years. The vacillating Vladislas I. allowed himself to be induced by the papal legate, Julian Cæsarini, to break the peace he had sworn to keep. H. was defeated in the bloody battle of Várna, 1444; the king perished in the fight, as also the cardinal-legate; H. was captured during his flight by the voivod of Wallachia; but upon a declaration that the whole of Hungary would rise to deliver the

noble prisoner, was safely escorted to the frontier, and there set free. During the minority of Ladislaus V. (son of Vladislas I.), H. was elected by the nation to be governor of Hungary. The battle of Rigómagó (1447), one of the bloodiest ever fought, was lost through the treason of the voivod of Wallachia; H. had once more to go through a short captivity. But the most splendid of his deeds was the storming of Belgrade, where the monk, John Capistran, carrying the holy cross, raised the enthusiasm of the Christian warriors to such a height, that a most complete victory brought that fortress again into the possession of the Hungarians. Shortly afterwards dysentery broke out in the camp, and H., the great Christian hero, after a short illness, fell a victim to the disease. Capistran, seventy years old, followed his friend into the grave two months later. H. left two sons, Ladislaus and Mathias (q. v.)—the former of whom was treacherously imprisoned, and beheaded at Buda, by the very prince whom his father had so faithfully served, Ladislaus V.; the latter was given in charge to George Podiebrad (q. v.) of Bohemia.

HUPEH, one of the central provinces of China, reputed the most fertile. The great river Yangtse flows through the south of the province, where it receives tributaries with various lakes on either side, nearly doubling its volume of water. Area, 70,450; population, 27,370,098. Wuchang is its capital.

HURÁ, a genus of plants of the natural order *Euphorbiaceæ*. *H. crepitans*, a native of the West Indies and tropical America, is a tree abounding in a very acrid milky juice; with stalked, heart-shaped, acuminate, leathery leaves. The fruit is a woody capsule, of the size of a pretty large apple, very much flattened, formed of 12—15 *cocci*, each containing a large seed, surrounding a common axis, which separate with great elastic force. Before the use of blotting-paper became general, the capsule was generally used in the West Indies as a sand-box—whence the tree is called **SAND-BOX TREE**—for powdering letters with fine sand; but it was found necessary to bind it with a hoop of iron, as even after being used for years, it would sometimes burst with a report like that of a pistol. The seeds are a violent drastic purgative.

HURD, RICHARD, D.D., an eminent English prelate, was born at Congreve, in Staffordshire, January 13, 1720, and studied at Cambridge University, of which he became a fellow in 1742. In 1749, appeared his first notable production, *Commentary on Horace's Ars Poetica*. In 1750, through Warburton's recommendation, he was appointed one of the Whitehall preachers, and ultimately rose to be Bishop of Lichfield and Coventry. He died May 28, 1808. His principal works are—*Dialogues on Sincerity, Retirement, The Golden Age of Elizabeth and the Constitution of the English Government* (1759); *Letters on Chivalry and Romance* (1762); and *An Introduction to the Study of the Prophecies Concerning the Christian Church* (1772). Hallam says of H., that he 'has perhaps the merit of being the first who, in this country, aimed at philosophical criticism.'—*Literary History of Europe*, 4th edit. Lond. 1854, iii. 475.

HURDLES, in military affairs, consist of straight flat rectangles of strong wicker-work, about 6 feet long, and 2 feet 9 inches high. They are useful in many ways, both in military and civil life, either as fencing, as barriers, or in fortification, in the construction of *hurdle-batteries*. These last were the invention of Sir William Congreve, who devised them as the speediest means of throwing up earth-works: three hurdles are fastened at their ends in

the form of a triangle, and the central space is filled in a short time with earth. These triangles can be constructed to any ground-plan, and with their

Hurdle-weaving.

aid, a body of soldiers can entrench themselves in a few minutes. The hurdle is composed of wattles interwoven (as shewn in the diagram) round stakes or pickets, the latter during the manufacture being fixed upright and firmly in the ground.

HURDWAR, perhaps the most famous spot on the Ganges, stands on the right or west bank of the river at the point where it emerges from the sub-Himalaya into the plains of Hindustan. From its position on the sacred stream, it attracts immense numbers of pilgrims for the purposes of ablution. The orthodox season comprises the end of March and the beginning of April—a great fair at the same time engrafting commerce on religion. In ordinary years, the attendance amounts to 200,000 or 300,000; but on the occasion of every twelfth year, the latest having occurred in 1856, the visitors, from the commencement to the close of the festival, are stated to average about 2,000,000. The place is 1024 feet above the sea, in lat. 29° 57' N., and long. 78° 14' E.

HURDY-GURDY, a very old musical instrument of the stringed kind, which, under the name of Leyer, or Baurenleyer, spread from its native country, Germany, over a great part of Europe. The Hurdy-gurdy consists of a flat, oval-shaped sounding-board, over which the strings are stretched, with a back or bottom of the same size and shape. These are bound together by tolerably deep sides, or ribs. On one side are from ten to twelve finger-keys, for shortening the sounding lengths of the strings when required. There are four strings, of gut, which are put into a state of vibration by being rubbed by the edge of a small wooden wheel charged with rosin, and turned by a handle. Two of the strings are tuned in unison as a key-note, or one of them a fifth above; they are placed out of reach of the keys, and form a sort of drone-bass. The other two strings are acted on by the keys, and produce a diatonic scale of from ten to twelve notes. The Hurdy-gurdy is only suited to simple music, and was used for such as had many repetitions. Its simplicity and cheapness rendered it, at one time, a favourite instrument among the peasantry of Europe. The instrument is now mostly to be seen in the hands of Savoyard boys, who play it on the streets.

HURON, one of the five great lakes of the St Lawrence, has Superior and Michigan above and Erie and Ontario below it. It separates Upper Canada from the state of Michigan, and extends in N. lat. from 43° to 46° 20', and in W. long. from 79° to 85°, and has been estimated to contain about 20,000 square miles. Its surface is 584 feet above the level of the sea; its depth about 1000 feet. Its waters are remarkable for their clearness and purity, whence the lake received from the French traders the name of *MER DOUCE*, or Fresh Sea. This vast body of water is said to contain 3000 islands, one of them, the Great Manitoulin, or Sacred Island, running parallel to almost the whole of the northern coast, which is one continuous mass of comparatively barren rocks.

HURRA', a shout of encouragement and applause, peculiar to the English. It serves also as a war-cry. As an engagement at sea commences,

the crews of the English vessels send up deafening hurrahs; in a charge on shore, English soldiers hurrah as they rush upon the enemy. There is something strangely exciting in this simple sound, and the combatants work themselves, as they shout, into a frenzied forgetfulness of danger.

HURRICANE. See STORMS AND WINDS.

HURST, a charge in Heraldry representing a small group of trees, generally borne upon a mount in base.

HUSBAND AND WIFE are the correct legal as well as popular terms to denote two persons married to each other. The modes of contracting marriage, with the accompanying ceremonies, and the impediments to marriage, will be more properly described under the head of Marriage (q. v.), and the mode of dissolving the marriage has been already partly described under Divorce (q. v.). The effects of marriage on the parties, and upon their property, will here be described, for which purpose the relation of husband and wife will be assumed to have been duly constituted. And as the effect is not the same in all parts of the United Kingdom, the laws of England and Ireland, which agree in this respect, will first be stated, and afterwards those of Scotland separately.

The effect of marriage in England and Ireland may be viewed under two heads—first, as regards the persons and the personal rights of the married persons; and secondly, as regards their property. 1. As to the person. So far as regards the person of the husband, he remains in precisely the same position as before marriage. He can sue and be sued, enter into contracts, and bind himself as fully after as before marriage, and he can even make a will, and bequeath all his property to strangers, regardless of the wife. As regards the person and personal rights of the wife, however, there is a material difference. Her person is said to be merged in that of her husband, and for many purposes they are treated as one person in the eye of the law. The meaning of that is, that the wife is under many disabilities. She cannot enter into contracts in her own name, and for most of the purposes of business she cannot be treated with as apart from her husband. Even the personal property she had before marriage, unless settled upon her by some settlement made before the marriage, becomes her husband's absolutely, and he can squander it at will. The principal thing which the wife can do in the way of entering into contracts after marriage, is to order goods and necessities for the use of herself and family and for household use; but this she does not in her own right, but merely as the agent of the husband, who is presumed by the law to give her an implied authority to that effect, and therefore the wife, when ordering goods, does not in any way bind herself, but merely her husband. As, however, this power is often abused by extravagant wives, the law qualifies the power in this way, that the goods and necessities so ordered must be reasonable, and suited to the rank and position in life of the husband. If goods are therefore ordered which are extravagant, the husband can repudiate the contract, and return them, but he cannot keep the goods and refuse payment; if, for example, he has seen his wife wearing an expensive dress which he knows he did not himself order or pay for, if he do not at once repudiate the transaction, and return the goods, he will be held to have consented and approved of the purchase, and he cannot afterwards escape liability for the price. This position of husband and wife is taken advantage of in the lower walks of life by means of the tally system,

which is the cause of much demoralisation. The tallyman calls upon the wife in the husband's absence, and offers her goods, which are generally in the end charged for at an exorbitant rate; but as he consents to take payment by instalments, and as the wife is advised to pay them secretly, the result is that the husband's money is often squandered. These transactions being a fraud on the husband, can generally be checked if, at the first moment he becomes aware of them, the husband repudiates them; and a county court, or any other court, would give him every assistance in getting rid of any liability so incurred, if he should afterwards be sued; but it generally happens that the matter has advanced too far before it is discovered; or he has done something which is construed into an adoption of the contract; or, what is frequently the case, he ignorantly supposes that he has no remedy.

The husband, being entire master of his own actions, has the power to decide where to live, and the duty of the wife is to live with him in the same house. If she refuses to do so, and lives apart without just cause, he is not bound to support her even with necessaries. If, however, she separates from him for just cause, the case is otherwise. Though the husband is bound to maintain his wife, there is, curiously enough, no direct means in England of enforcing this duty. There are circuitous means only. The wife, for example, cannot sue the husband herself, but she has an implied authority to order necessaries, and the tradesman so supplying these can sue the husband for the price. Hence it is that when a tradesman supplies a wife, who is living apart, with necessaries, before he can be sure of recovering the price from the husband, he must satisfy himself that the wife has just cause for living separately. There are several just causes for her living apart. If the husband, for example, treats her with what is deemed cruelty in the eye of the law—as keeping a mistress in the house, starving and assaulting her—she is entitled to leave him, and she can order necessaries at his expense from any tradesman willing to supply her. There are, however, many degrees of cruelty and ill-usage for which the wife has practically no remedy, and of which the law can take no cognizance; for the law cannot remedy a tithe of the ills of life. If the husband have the means, and yet refuses to support his wife, or what is the same thing, if he wilfully refuses to work, being able to do so, and she becomes chargeable to the parish, the parish authorities can seize the goods of the husband, if any, and sell them for her support; or he may be imprisoned by justices of the peace, as an idle and disorderly person, for a month. But in such circumstances the husband more frequently deserts his wife. If he deserts her, and leaves her destitute, and a charge upon the parish, he may then be treated under the Vagrant Act as a rogue and vagabond, and imprisoned by justices of the peace in the house of correction for three months. If the desertion continue for a period however long, it is no ground in England for a divorce; but if it is coupled with adultery, and continues two years, it will be so. It sometimes happens that after a husband has deserted his wife, she maintains herself by her own exertions, and acquires property; in such a case, her earnings still belong to her husband, and may be seized by him or his creditors at any moment, unless she obtain, as she is entitled to do, an order from a magistrate or justice of the peace to protect this property. Stats. 20 and 21 Vict. c. 85, sect. 21; 21 and 22 Vict. c. 108, sect. 6, 7, 8.

As regards crimes committed by a wife, she is in general liable to be punished for these in the same

way as if she were unmarried. But there is a peculiarity as regards crimes committed by the husband and wife jointly. If the crime be treason or murder, both are punished precisely as if they were unmarried. But in all the lesser crimes, the theory as well as the practice is, that if the wife was a party to the crime, and committed it in her husband's presence, she is presumed by the law to have so acted under the compulsion or coercion of her husband, and is acquitted as a matter of course. And so favourable is the law on this ground to married women who commit crimes, that, in the absence of any direct evidence one way or the other as to where the crime was committed, it will still be presumed that the wife acted under this marital coercion, and so she escapes punishment. Another curious anomaly arising from the maxim that husband and wife are one person, is, that a wife cannot be convicted of stealing her husband's goods. If she abscond with his property, however valuable, she cannot be punished. But this rule is again qualified by the circumstance, that if she commits adultery, and afterwards absconds with the adulterer, both taking away the husband's goods, the adulterer may be convicted of the larceny, though it is doubtful if she is in that case liable to any punishment. And where the third party has not in view any adultery with the wife, but joins her in taking away the husband's goods, in many cases neither he nor the wife can be punished criminally.

Husbands and wives may be witnesses for or against other parties in all civil cases, i.e., actions and suits relating to debts, contracts, and wrongs which are not crimes, and in all inquiries of a civil nature. So when the husband is himself a party in a civil action, his wife may be compelled by the opposite party to be a witness; but in all such cases neither husband nor wife can be compelled to disclose any communication made to him or her by the other spouse during the marriage. As regards all criminal proceedings instituted against either husband or wife, the other spouse is neither competent nor can be compelled to be a witness; but where the husband and wife are not the accused, but the prosecuting parties, then, inasmuch as the crown is presumed to be the prosecutor, and they are not parties, they may be both witnesses, subject to the qualification as to not being bound to disclose communications made by and to each other during marriage. There is an exception also to the rule that neither can be a witness against the other in criminal proceedings—viz., where the wife charges her husband with an assault or other crime of greater degree upon her person, she is in that case only a competent witness against him, for otherwise the crime might go unpunished. Moreover, in all proceedings instituted in consequence of adultery of the husband or wife, neither of the married parties is competent or can be compelled to be a witness.

2. As to the property of the married persons. As regards the husband, he still remains sole owner of his property, real and personal, and can do what he likes with it; and he may, as already stated, by will devise and bequeath it all to strangers, regardless of the wife. He can also sue and be sued as before, irrespective of his wife. But as regards the wife, the case is different. Owing to her incapacity to contract or even to hold personal property independently of her husband, she can neither sue nor be sued except where she has separate property settled upon her, as afterwards explained. If she had personal property before marriage, the whole—with a few exceptions—becomes the sole and absolute property of the husband immediately after the marriage, if there is no marriage settlement. All debts which were due to her before marriage

also become after marriage debts due to him, provided he chooses to reduce them into possession, and sue for them. As a general rule, therefore, the wife never can sue in her own name for anything; even if she were to earn money as wages by her own personal exertions, she cannot sue for them without her husband being joined as a party, nor can she even take or sue for a legacy left to her without her husband, unless it was expressly left to her separate use. The only difference as regards the right of suing is, that where the debt was due to her before marriage, or the money claimed has been earned by her during marriage, both she and her husband may sue for it, or he alone must sue for it, according to circumstances, but when recovered, it belongs to him absolutely. In like manner, when the wife was in debt before her marriage, the husband, who in effect marries her debts also, must be sued jointly with her; and so, if she committed some wrong, as a slander or assault, the husband must be sued jointly with her; but where she merely ordered goods which were supplied to the husband, he alone is liable, and he alone can be sued. When the wife is properly sued along with the husband, both can be imprisoned if the debt is not paid; but the wife will be immediately discharged, as a matter of course, on application to a judge, provided she has no separate property of her own out of which the debt can be paid. The above rule as to the wife's personal property becoming the husband's absolutely after marriage, suffers a qualification when such property consists not of money or chattels, but of what are called chattels real, such as leases and mortgages. In such a case, they become so far the property of the husband, that he can sell them during his life, but he cannot bequeath them by will; and on his death they remain hers, while on her death they become his. Again, where the wife's personal estate before marriage consisted of mere rights of action or debts due to her, they are so far his that he can at any time sue for them, and so reduce them into possession, and make them his own absolutely; but he cannot bequeath them by will; and if he do not sue for them in his lifetime, they survive to the wife after his death. As regards the wife's real estate—i. e., her lands and houses held in freehold—the husband does not acquire these absolutely by the marriage, but he thereby becomes entitled to a life-estate in them. He cannot sell the property, though he may sell his own life-estate in it. On the other hand, though the real estate still continues to belong to the wife, she cannot sell it, like an ordinary owner, unless she separately acknowledges the deed of sale, which is done by her going before a commissioner or a judge, who examines her in private, and explains the nature of the deed, and sees that she understands its purport, and that she acts freely, without the coercion of the husband.

On the death of one of the married parties, the property is disposed of as follows: if the husband dies, his will may, as already stated, dispose of his whole property to strangers, irrespective of the wife, and she may be left entirely destitute in consequence. But there are some things his will cannot take away from her, as, for example, her leases, mortgages, choses in action, and her real estate. To these may be added her paraphernalia, which consists of her personal apparel and jewels; but even these will be taken by her husband's creditors, if there is a deficiency of assets. If the husband die without a will, the law is more liberal to the widow: she is entitled to one-third of the husband's personal estate absolutely, and not merely to a life-interest; she is also entitled to dower out of her husband's real estate, i. e., to a life-interest of one-third of

the whole real estate which belonged to him. This right of dower, however, can in general be defeated by the husband's will. When the wife dies before the husband, he becomes entitled to nearly all her personal estate, of whatever description, even though she left children of the marriage; and it must be recollected that she can in general make no will which has any effect, if the husband chooses to repudiate it. As regards the wife's real estate, if a child has been born, who might by possibility have inherited her real estate, then the husband has, by the courtesy of England, an estate for life in the whole of such real estate; but if no child has ever been born, the real estate goes to the wife's heir-at-law, or if none, to the crown.

The common law of England has been often considered, especially of late years, as unjust towards women, in subjecting them too much to the caprice of their husbands. There are, however, several ways of avoiding this, but they are only available, as will at once be seen, to the rich. The most effectual way of preventing the husband having powers so absolute as the law gives him, is by executing a marriage settlement before marriage. By means of a settlement, not only all the property which the wife has before marriage, but also all which she expects to have during marriage, may be settled upon her to her separate use, and put entirely out of the power of the husband. This is done by the agency of trustees, who hold and manage her property as their own, keeping the husband at arms' length, and yet she has almost the same power of acting independently as if she were not married: she can draw her rents, keep her bank-account, enter into contracts, and bond her separate property, and also execute her will, as if she were a man. Sometimes the husband and wife both settle their property by the same settlement; or if the wife has no property, the husband may settle his upon her in the same way. She is in that case generally allowed a certain sum per annum as pin-money, to spend upon her personal adornment; and by means of her trustees, she can sue her husband for this sum, if not punctually paid. Sometimes, by the marriage settlement, if the husband had no money, the wife's money is settled partly upon him, so that he has a certain allowance per annum; but in the event of his becoming insolvent or bankrupt, the money is not to go to his creditors, but to remain for the wife's use. In short, there is practically no limit to the variety of mutual arrangements which can be made by means of a marriage settlement, which can always mitigate and provide against the possible hardships of the common law. It is on the same principle that, in some cases, the Court of Chancery has interfered to prevent the husband acquiring so absolute an interest in the wife's property as the common law gives him. Thus, if a legacy or other property has been left to a wife, and he has made no other provision for her, the court will not pay the sum to him until he has settled the same upon her and the children; but this is only done when the legacy or other property exceeds £200. It may also be mentioned, that a person may, if he uses proper phraseology, bequeath a legacy to a married woman, so that the husband shall not take it; this is done by simply adding the words 'for her separate use, independently of any husband.'

When a marriage is once contracted, the parties cannot of themselves, or by any arrangement they can enter into, put an end to it; nothing can do this but a divorce, or the death of one of the parties. It is a delusion not uncommon among the working-classes, that if one of the parties runs away or disappears, the marriage is at an end, and the party

left behind may, at least after a time, marry again. This is, however, not the case. It is true, that if one of the parties has not heard of the other for seven years, and has reason to believe that that other is dead, the former cannot be convicted and punished for bigamy in marrying again. But this is merely an excuse for escaping the usual punishment; the second marriage only remains good if the lost party is really dead, or never turns up again. If at any time, however remote, the party supposed to be dead returns, the first marriage still remains good, and the second bigamous marriage becomes a nullity, and the children born of it, if any, are bastards, so that so long as both parties live, the only way of dissolving the marriage, so as to permit either to marry again, is a divorce, which can be obtained only on certain grave grounds. There is an intermediate state, called *Judicial Separation* (q. v.), which can be brought about for certain grounds less than what would warrant divorce. But though a wife judicially separated may enter into contracts, and is, as regards her dealings, much the same as an unmarried woman, she is still a wife, and cannot marry again; and if the parties are living separate by mutual agreement, they are nevertheless married, and have most, though not all, of the rights of married persons.

Scotland.—The law of husband and wife in Scotland as regards their personal rights and disabilities, and the property during the marriage, does not substantially differ from the law of England and Ireland, but the following points may be noticed. As regards their persons and personal rights, and crimes, the law is the same. It is often said that in Scotland the movable property of both husband and wife become a kind of joint-stock property, called *Goods in Communio* (q. v.); but this phrase has no meaning except with reference to the principle of the division of the property after the death of one of the parties, and the dissolution of the marriage. As long as the parties live, the husband is, as in England, entire master, except that he cannot on deathbed bequeath more than a share of the property away from the wife. The same rule exists that the wife's movable property becomes the husband's, and her heritable property remains her own, subject to the husband's life-rent. When she disposes of her heritable property by deed, she must also judicially ratify the deed by going before a magistrate, and acknowledging that she acts of her own free will. When the husband deserts her, the wife may now in Scotland, as in England, obtain a judge's order to protect her earnings and monies; and when a wife succeeds to property, neither her husband nor his creditors can take this until a reasonable provision has been made for her out of such property. (Conjugal Rights Act, 24 and 25 Vict. c. 86, sect. 1—6, 16.) A wife has, in Scotland, the same implied power to bind her husband for necessities; but in Scotland the husband can, by a process of inhibition, give a general notice to tradesmen not to supply her at his expense, and this notice will be binding on all the Queen's subjects. No such notice in England would have so strong an effect; but even in Scotland such a notice as inhibition does not prevent the wife ordering necessities, if not otherwise supplied. A rich wife is bound, in Scotland, to maintain her husband out of her separate estate; but not so in England. In Scotland, as in England, the rights of the parties may be varied by an antenuptial contract or marriage settlement; but there is less necessity for it, for the common law makes a provision for the wife in spite of her husband, inasmuch as he cannot by will bequeath away from her more than a third or half of his movable property respectively, according as there are children

or no children. See *GOODS IN COMMUNION*, *WILL*. In Scotland, as in England, the married parties may also execute a post-nuptial contract, which will be binding if the husband was solvent at the time of executing the deed; but though in England it will be in that case valid both as against wife and children and creditors, yet in Scotland it will bind the wife and children only if they thereby get a better provision than they would have been entitled to independently of any deed, or at least something which they accept as equivalent. And, as a general rule, nothing can be done after marriage by the parties so as to settle the property on either party, if the effect is to defeat their then creditors. The Scotch widow's terce corresponds to the English widow's dower, and the rule as to the paraphernalia is not substantially different. The law as to the dissolution of the marriage and bigamy is the same in Scotland, though the grounds of divorce are more liberal in Scotland. See *DIVORCE*. Paterson's *Compendium of English and Scotch Law*.

HUSBANDRY, SERVANT IN, a description of agricultural servant. Such a servant differs from ordinary domestic servants in this, that if the servant in husbandry leave his or her work without cause, &c., he or she can be punished by imprisonment on proceedings before a justice of the peace. This is so in all parts of the United Kingdom.

HUSKISSON, WILLIAM, an eminent English statesman, was born at Birch Moreton, in Worcestershire, 11th March 1770, and in 1783 was sent to Paris to study medicine. He took part in the storming of the Bastille, and as a member of the Club of 1789, attracted attention by a number of speeches on subjects of political economy. In 1792, he returned to England, received a subordinate appointment under the Tory government, and formed an intimate acquaintance with Pitt and Canning. In 1795, he was selected by Dundas, the war minister, to be first under-secretary; and sat in parliament for Morpeth. He subsequently held several offices under Pitt, with whom he retired in 1801, and on the dissolution of parliament in 1802, lost his seat in the House of Commons. In 1804, he was returned for Liskeard, and was appointed secretary of the treasury in the new Pitt cabinet. On Pitt's death, however, in 1806, he lost this office, but was restored to it by Mr Percival in 1807. He sat for Harwich, 1807—1812; Chichester, 1812—1823; and Liverpool, 1823—1830. In 1814, he was chief Commissioner of the Woods and Forests; in 1822, president of the Board of Trade; in 1827, secretary of state for the colonies; and in 1828, secretary of state for foreign affairs. But this office he resigned, and retired from the ministry the same year. Through his exertions the old restrictions on the trade of the colonies with foreign countries were removed. He also obtained the removal or reduction of many import duties, considerable relaxation of the navigation laws, and is allowed to have been the great pioneer of free trade. He received fatal injuries at the opening of the Liverpool and Manchester Railway, 15th September 1830, and died the same evening. A collection of his speeches was published in 1831. Both from the comprehensiveness of the views which they exhibit, and their fulness of accurate details, they are interesting to the student of political economy.

HUSS, JOHN, the Bohemian reformer, whose name is associated with that of Jerome of Prague (q. v.), both on account of the work which they wrought, and the death which they suffered, was born in 1373 at Hussinecz, near Prachaticz, in the south of Bohemia. He studied at the university of

Prague, where he soon made great progress in the branches of learning most valued in that age, took his degree of Master of Arts in 1396, and began to lecture publicly in 1398. In 1402, he became preacher in the Bethlehem Chapel in Prague, and laboured with the greatest earnestness for the instruction of the people, and in the discharge of all his clerical functions. As a preacher, he was greatly esteemed both by the common people and by the students; whilst as confessor to Queen Sophia, he obtained access to the court. At this time he became acquainted with the writings of Wickliffe, which exercised a great influence over him. The monks and clergy were of course violent enemies to H., as he denounced, with continually increasing boldness, their corruptions. Archbishop Sbinko burned the writings of Wickliffe in 1410, in compliance with a brief of Pope Alexander V., and complained to the pope of H. as a Wickliffite. Hereupon he was summoned to Rome; but he did not go, and the combined influence of the people, the court, and the university, compelled the archbishop to remove a prohibition which he had issued against his preaching. But in 1412, Pope John XXIII. having published a bull of indulgence in order to a crusade against Ladislaus, the excommunicated king of Naples, whose kingdom the pope claimed as a papal fief, H. boldly raised his voice against the whole procedure as unchristian, whilst Jerome of Prague also stood forth to condemn, in the strongest manner, both the bull and the vendors of indulgences. An interdict against H., in 1413, was the consequence. H., however, appealed from the pope to a general council and to Christ, and wrote a book, *On the Church*, in which he condemned the abuses of the papacy, and denied the unconditional supremacy of the Roman pontiff. Thinking himself no longer safe in Prague, he now retired to his native place, where he preached the gospel with great power. In 1414, he went to Constance to the general council, summoned thither, indeed, on a charge of heresy, but under the protection of King Wenceslaus, and having a safe-conduct from the Emperor Sigismund. Having reached Constance on the 3d of November, he was, on the 28th of the same month, apprehended in spite of the remonstrances of the Bohemian and Polish nobles. His trial was conducted with little regard even to the appearance of equity. On the 6th of July 1415, thirty-nine charges were exhibited against him, some of which he acknowledged as exhibiting his doctrine, whilst others he utterly denied. Being required to recant his alleged errors, he refused to do so till they should be proved to be errors. He and his writings were now condemned to the fire, and in spite of his safe-conduct, the sentence was carried out on the same day, and the ashes of the martyr were thrown into the Rhine.

HUSSAR, a light-cavalry trooper, dressed in a loose jacket, with other articles of attire easy in set, and a fur cap; armed usually with a sabre and pistol. The idea of these troops, now in every army, came originally from Hungary. There are 13 regiments of Hussars in the British army (1862—1863).

HU'SSITES, the followers of Huss (q. v.). Honouring him and Jerome of Prague as martyrs, they despised the decrees and anathemas of the Council, and took terrible revenge on the priests and monks. The symbol of their confederacy was the cup, the use of which in the Lord's Supper they extended to the laity, as James de Misa had already done with the approbation of Huss. In 1417, King Wenceslaus was constrained to grant them the use of many churches. After his death, 13th August

1419, the majority of the states refused to acknowledge his brother, the Emperor Sigismund, who had broken his safe-conduct to Huss. And the papal instructions to the Cardinal Legate, John Dominico, requiring him to employ violent measures for the conversion of the Hussites, an insurrection ensued, and the war began which is known in history as the Hussite War. Convents and churches were reduced to ashes, and priests and monks were slain. The Hussites divided into two parties—the more moderate known by the name of *Calixtines* (q. v.), and the more extreme by that of *Taborites* (q. v.).

HUSTINGS (of doubtful derivation), a place or temporary platform where members of parliament are formally proposed or nominated for election.

HU'SUM, a small town of Denmark, in the province of Slesvig, and 22 miles west of the town of that name, is situated on the coast of the North Sea, at the mouth of a small river. It was formerly strongly fortified, and possessed many ships. Pop. 5079, who manufacture leather and tobacco, and carry on distilleries and breweries, and some trade in wool and cattle.

HUT, in army affairs, is a wooden structure, more or less rough in its details, for the housing of troops. It is substituted very often for the tent, when the sojourn in a camp or cantonment is likely to be of consideration, as, for instance, through a winter—a hut, however rude, which is wind and water tight, being as superior in comfort to a tent as the latter is to the open air. Huts may be made of almost any size, and are sometimes for one officer; at others, for as many as 100 men. The principal hut encampments at present in the United Kingdom are at Aldershot, Shorncliffe, Colchester, and the Curragh of Kildare; in British North America, hut-camps are situated at intervals of a day's march on the route from New Brunswick to Quebec, and the troops who made that winter-march in 1861—1862, found their shelter truly welcome.

As the hut is as useful to the settler in a wild country as it is to a soldier, we give some of the particulars of their manufacture in different forms. Huts are of four sorts: 1. The *log* hut; 2. The *framed* hut; 3. The *pisé* hut (of tempered clay).

The *log* hut is formed of rough logs or trunks of trees, laid crosswise in tiers to the required

Fig. 1.

height, as in fig. 1, the angles being formed, as in fig. 2, by a notch on each side of the log, about one-third of its diameter in depth, and a few inches from the extremity. The space between the logs is then made water-tight and air-tight

by a stuffing of clay, wattles, fallows, or small bundles of twigs. Within, the joints should be lined with laths, or the whole interior may be boarded with inch-planks, if such are attainable. The roof should be supported by a scantling (see Roofs), and may consist of overlapping boards, or boards laid flush and shingled, or laths and shingles, or even birch-bark alone. The

Fig. 2.

door is usually ledged, and there are one or two windows, with glazed sashes and shutters. These should be made by regular carpenters, and taken to the place of building ready for use. A hut thus formed makes a snug habitation, and will last for many years; exclusive of the sashes, two men can erect, in about a week, a hut of rough logs which shall be sufficiently large for their residence—that is, with an interior area of about 15 feet by 10 feet.

When circumstances permit, the logs are occasionally squared, which enables them to be fitted more accurately to each other, and adds, of course, to the solidity and finish of the whole structure, as well as to its durability. In this case, the corner logs, instead of crossing each other, are joined by a dove-tail, or by cutting the end of each to an angle of 45°.

The framed hut has the advantage over the log hut of allowing more exactness of finish, and from its lightness and portability being easily transported to any place where logs for hut-building might not be forthcoming. It consists of a strong framework of squared wood, properly fitted together, and covered with overlapping planks or weather-boards. The side of a framed hut is shewn in fig. 3. The pieces should be sawn to the proper size, fitted to each other, and numbered; then packed together in small compass for conveyance to the intended site, where the structure can soon be erected. No one piece need exceed 11 feet in length, 6 inches in breadth, and 2 inches in depth. The uprights should not be more than from 15 inches to 18 inches apart, and should be firmly held by diagonal tie-rods, as in the illustration. The first step is to carefully level the ground on which the hut is to stand, and if a dwarf-wall of stone or brick, 8 or

Fig. 3.—Side of a framed Hut.

10 inches high, can be built round, so much the better. On this ground or wall a rectangular frame of thick wood (say 6 inches by 3) must be laid as a basis for the framework; on this latter the uprights are placed, the binding tie-rods fixed, and the cap-sill, corresponding to the frame below, placed above all, every joint being carefully mortised and tenoned. The weather-boards can now be nailed on the outside, and when the roof is put on, the hut is complete. The breadth should not, for stability, exceed 16 feet; and when the hut is of any considerable length, cross-beams should be thrown from side to side at the top. The roof should be made of ordinary scantling, as described under Roofs. It is usually estimated that one of these huts, 30 feet long, 16 broad, and 10 high, makes a good barrack-room for 20 soldiers. The camps at

Aldershot and the Curragh are mainly formed of framed huts. Where extra warmth is desired, the spaces between the uprights are built up roughly with bricks, burned or unburned.

Pisé huts, common in the south of France, and very useful where wood is scarce, as well as very comfortable, are walled with blocks of clayey earth, rammed with great pressure into wooden moulds until they assume the forms of stones. These are laid one above each other much as stones themselves would be by a mason, and the wall so formed is both durable and slightly.

The most critical operation for the non-professional hut-builder is roofing. This is usually of thatch, shingles, paper, or felt, if lightness be an object; and of stones, bricks, or tiles, if the walls be calculated to bear their pressure.

HUTCHESON, FRANCIS, a distinguished philosopher of last century, was the son of a Presbyterian minister in the north of Ireland, where he was born in 1694. He studied for the church at the university of Glasgow, but shortly after the completion of his theological course, he was induced to open a private academy in the city of Dublin, which proved highly successful. In 1720, he published his *Inquiry into the Original of our Ideas of Beauty and Virtue*, &c., which was the means of introducing him to the notice of many influential personages, such as Lord Granville, then lord-lieutenant of Ireland, Archbishop King, Primate Boulter, and others. This work was followed, in 1728, by his *Essay on the Nature and Conduct of the Passions*; and in the year after, he was appointed professor of moral philosophy in the university of Glasgow. Here he died in 1747. His largest and most important work, *A System of Moral Philosophy*, was published at Glasgow in 1755 by his son, Francis Hutcheson, M.D., with a Preface on the Life, Writings, and Character of the Author, by Dr Leechman, professor of divinity in the same university. As a metaphysician, H. may be considered a pioneer of the so-called 'Scotch school.' From the period of his lectures, according to Dugald Stewart, may be dated the metaphysical philosophy of Scotland, and, indeed, the literary taste in general, which marked that country during the last century, although, as Stewart acknowledges and Hamilton shews, traces of the Scotch philosophy appear in earlier writers. But it is as a moral philosopher, rather than as a metaphysician, H. shines. His system is, to a large extent, that of Shaftesbury, but it is more complete, coherent, and clearly illustrated. H. is a strong opponent of the doctrine, that benevolence has a selfish origin. The faculty by which moral distinctions are recognised, H. (after Shaftesbury) terms a *moral sense*. See ETHICS.

HUTCHINSON, JOHN, an English theological writer, born 1674 at Spennithorne, in Yorkshire. He was for some time steward of the household of the Duke of Somerset, and left his service to devote himself to his religious studies, the duke procuring for him a sinecure appointment of £200 a year from government. In 1724, he published the first part of a work called *Moses' Principia*, in which he defended what he regarded as the Mosaic cosmogony, and assailed Newton's theory of gravitation. He continued to publish a succession of works till his death, which took place on 28th August 1737. His religious system is best exhibited in his *Thoughts concerning Religion*. The leading principle of it is, that the Holy Scriptures contain the elements not only of true religion, but of all rational philosophy, which, however, was to be derived only from the original Hebrew; and it, for that purpose, was subjected to strange critical or rather fanciful processes.

His works at one time exercised a considerable influence. His followers were called HUTCHINSONIANS, and among them—strange as it may seem—were persons of considerable learning and celebrity.

HUTCHINSON, ANNE, a religious enthusiast, of American celebrity, emigrated from Lincolnshire, England, to Boston, Massachusetts, in 1636. Living in a community prone to religious excitement, she claimed to be a medium of divine revelations, and held meetings for women, in which she held forth Antinomian doctrines. Great controversies arose, and a synod was called, in which her teachings were condemned, and she was banished from the colony. She and her friends now obtained from the chief of the Narragansetts liberty to reside in Rhode Island, where they set up a community on the highly commendable principle, that no one was to be 'accounted a delinquent for doctrine.' After the death of her husband (who shared her opinions), she removed to a Dutch settlement, in the colony of New York, where, in 1643, she and her whole family of 15 persons were taken prisoners by the Indians, and all but one daughter barbarously murdered.

HUTTEN, ULRICH VON, famous in the history of the Reformation, was descended of an ancient and noble family, and was born at the family castle of Steckelberg, in the electorate of Hesse, April 1488. When he was ten years of age, he was placed in the monastery at Fulda; but disliking this mode of life, he fled to Erfurt in 1504, where he associated with scholars and poets. He then lived at various places in Northern Germany till about 1512, when he went to Pavia to study law. After passing several years in Italy, he returned to Germany, and made himself conspicuous by his publications, especially those concerning the affair of Reuchlin and the Dominican Hoogstraten, in Cologne, in which he came to the support of Reuchlin, and displayed no small learning and great power of satire. He again went to Italy in 1515, to take the degree of Doctor of Law, and returned to his native country in 1517. He was crowned with the poet's laurel crown at Augsburg, and the Emperor Maximilian conferred on him the honour of knighthood. In the same year he edited a work of Laurentius Valla, found in a convent, *De Falsâ Creditâ et Ementitâ Donatione Constantini Magni*, and in 1518 accompanied Albert, Archbishop of Mentz, to the diet of Augsburg, where Luther had his famous conference with Cajetan. Subsequently, he established a small printing-press of his own, and employed himself in writing and disseminating pamphlets fully exposing the arrogance and wickedness of the Romish clergy. The Archbishop Albert denounced him to Rome, whereupon he entered into an immediate and avowed connection with Luther, whom he had hitherto despised. At this time, also, he began to write in the German language, instead of Latin. Persecuted by his enemies, he availed himself of the protection of Franz von Sickingen, but was soon forced to flee. From this time H. was compelled to adopt a wandering life, and died 31st August 1523, in the Isle of Ufenau, in the Lake of Zürich. H. was bolder and more open in the expression of his opinions than almost any man of his age. He did much to prepare the way for the Reformation, and to promote it. It may be attributed to him as a fault, that he was too reckless of consequences, and not sufficiently tender in dealing with things that had become venerable in the eyes of many; but he was a man who feared nothing, even when almost all his friends trembled. He was a master of the Latin language. He left 45 different works, of which a collective edition was published at Berlin

in 1821—1827, in 6 volumes. The best life of H. is that published at Leipsic, in 1857, by Dr David Friedrich Strauss.

HUTTON, CHARLES, an eminent mathematician, was the son of a superintendent of mines, and was born at Newcastle-upon-Tyne, 14th August 1737, and in 1755 became teacher in a school at Jesmond, and afterwards at Newcastle, till 1773. During this period, he published his *Treatise on Arithmetic and Book-keeping* (1764); *Treatise on Mensuration* (London, 1771); and *Principles of Bridges, and Mathematical Demonstration of the Laws of Arches* (Newcastle, 1772). In 1773, he was appointed to the professorship of mathematics at the Royal Military Academy, Woolwich, and in November 1774 was elected a fellow of the Royal Society. Soon after this, he was selected to perform the necessary calculations for determining the density of the earth from Dr Maskelyne's observations on Schiehallien, and his report was published in the *Philosophical Transactions* for 1778. In 1779, he received the degree of LL.D. from the university of Edinburgh. He died 27th January 1823. H.'s most important works are—*Tables of Products and Powers of Numbers* (London, 1781); *Mathematical Tables* (London, 1785); *Mathematical and Philosophical Dictionary* (London, 1795); *Course of Mathematics* (London, 1798—1801); and *Recreations in Mathematics and Natural Philosophy* (4 vols. London, 1803); the last being a most interesting and instructive work. Besides these, he regularly contributed mathematical papers to the *Ladies' Diary*, of which he was for some time editor, and also to the *Philosophical Transactions*. His biography has been written by Dr Olinthus Gregory.

HUTTON, JAMES, a celebrated geologist, was the son of a merchant in Edinburgh, and was born there 3d June 1726. He studied in his native city, and afterwards at Leyden, where he took the degree of M.D. He devoted himself, however, not to the medical profession, but to agricultural pursuits and to the science of chemistry, from which he was led to mineralogy and geology. He contributed much to the improvement of agriculture in Britain. He made some chemical discoveries, and is the author of a Theory of the Earth and of a Theory of Rain. His Theory of Rain has been since acknowledged by men of science as generally correct, although at first it met with some opposition. His Theory of the Earth has for its distinguishing feature the supposed agency of a central heat, by which the elevation of strata and many other phenomena are accounted for, and some parts of it may be regarded as now also substantially admitted by all geologists, although for a time it was combated by the followers of Werner, who sought to explain everything by aqueous solution and crystallisation. Dr H. was indeed too extreme in his theoretical views, and some of his followers were still more so. He was, however, not only a theorist, but an observer in geology, and his discovery of granite veins is of no small importance in the history of that science. He died March 26, 1797.

HUY, a strongly fortified town of Belgium, in the province of Liege, is romantically situated amid lofty rocks on both banks of the Meuse, and in the immediate neighbourhood of the finest scenery of that river, 17 miles south-west of Liege. Its citadel, the works of which are partly excavated in the solid rock, commands the passage of the river. The church of Notre Dame, a graceful Gothic edifice, was begun in 1311. In the vicinity are iron-works and coal-mines, in the products of which the

inhabitants carry on a lively trade by means of the Liege and Namur Railway. The principal manufactures are paper, leather, beer, spirits, and an inferior kind of wine. Pop. 10,011.

Peter the Hermit, on his return from the first Crusade, founded here the former abbey of Neufmoustier (*Novum Monasterium*), and was himself interred within it. H. has been frequently taken during the wars, of which this region has been the seat. It was last captured by Marlborough and Coehoorn in 1703.

HUYGHENS VAN ZUYLICHEM, CHRISTIAN, one of the great philosophers of the 17th c., was born at the Hague, April 14, 1629, and was the second son of Constantine Huyghens, secretary and counsellor to the princes of Orange. H. studied at Leyden and Breda. His first work, *Theorematum de Quadratura Hyperbolæ, Ellipsis, et Circuli, ex Dato Portionum Gravitatis Centro* (Leyden, 1651), is an example of that powerful geometrical talent which lay at the foundation of all his scientific achievements. Soon after this, he constructed the pendulum-clock, following out the idea first suggested by Galileo (q. v.). A complete description of H.'s instrument is contained in his great work, *Horologium Oscillatorium, sive de Motu Pendulorum* (Hague, 1658).

This work contains expositions of many of the cases of constrained motion, especially those applicable to the construction of time-keepers. H. has also developed and given precision to the investigations of Galileo upon accelerated motion under the action of gravity; and there is no doubt, that to the clearness of his demonstrations, his great successor, Newton, in preparing his magnificent development of the principle of accelerating force, was largely indebted. Newton was a student and admirer of his works, and assigns to him, along with Sir C. Wren and Wallis, the distinguished epithet of *hujus ætatis geometrarum facile principes*.

By means of an improved telescope of his own construction, H., in 1655, discovered the ring of Saturn and the fourth satellite of that planet. In 1659, he published an account of these discoveries in a work entitled *Systema Saturnium, sive de Causis Movendorum Saturni Phenomenon, et Comite ejus Planetâ Novo*. In the end of this work is described an invention of great importance in astronomy—namely, the Micrometer (q. v.), by which small angles between objects viewed by a telescope are accurately measured. In 1660, H. visited England, where he was admitted a member of the Royal Society. He discovered the laws of collision of elastic bodies about the same time with Wallis and Wren, and also made a material improvement in the air-pump.

In 1666, H. received an invitation to settle in France, with the promise of a pension from Colbert, then all-powerful in that country. He repaired to Paris, where he remained till 1681, having been admitted to the membership of the Royal Academy of Sciences; but alarmed at the danger which seemed impending over the Protestants, he returned to his own country. After his return, he still continued his favourite pursuits till his death at the Hague, 8th June 1693.

The optical works of H. lastly claim our attention. They are chiefly remarkable for his maintaining a theory of light, which, opposed as it was to the then more popular theory of Newton, is substantially the same with that which is now called the *undulatory theory*. By means of his theory, he explained the ordinary phenomena of reflection and refraction, and further succeeded in a satisfactory explanation of the phenomenon of double refraction, which Newton's theory failed to account for.

HUYSUM, JAN VAN, a celebrated Dutch painter of flowers and fruits, was born at Amsterdam in 1682, and acquired the rudiments of his art from his father, a landscape-painter of very considerable talent. H. surpassed all his predecessors in mellowness, purity, and delicacy of colouring; the exquisite disposition of his lights and shadows; and above all, in his miraculous rendering of dew-drops and the motions of insects. He died at Amsterdam in 1749. H.'s master-pieces are to be found in the galleries of Vienna, Munich, Dresden, and St Petersburg.

HWANG-HO, **HOANG-HO**, or **YELLOW RIVER**, one of the principal rivers of China, about 2400 miles in length, the area of its basin being not less than 700,000 square miles. It rises in a marshy plain lying between the Bayan-kara and Kwanlun Mountains, in a lake called Ala-nor, in lat. 35° 30' N., long. 96° E. Its course is so crooked that, after it leaves Ala-nor, it turns first south 30 miles, then east 160, then westward 120, winding about the gorges of the Kwanlun, then north-east into the province of Kansuh, next it proceeds northward for 430 miles, till it is bent eastward by Inshan, on the edge of the table-land, where it encloses within its great bend the country of the Ortous Mongols. At the Peh-ling it is deflected south, where it divides the provinces of Shanse and Shense for 500 miles. At the south-western corner of Shanse, it receives its largest tributary, the Wei-ho, 400 miles in length; from this point the Yellow River flowed until recently eastward to the ocean, 650 miles distant, in lat. 34°. It is little used for navigation, Chinese vessels being unable to stem its impetuous current. In some parts of its eastern course, it is above the great plain through which it passes. The embankments requisite for averting inundations are a source of never-ending expense to the government, and their yielding to floods a frequent cause of desolation to extensive districts of country. Dr Macgowan announced lately, in the *North China Herald*, that this wayward and turbulent stream had suddenly shifted its course, turning off near Kaifung-foo in a north-easterly direction, discharging its waters into the rivers of Chihle, which disembogue in the Gulf of Pehchele, the mountainous province and promontory of Shantung intervening between its former and its present mouth, a distance by coast-line of about 500 miles. More recently, it was announced that the bed of the Yellow River, for more than two hundred miles from its mouth, was a belt of sand, which, since the spring of 1853, has been, to use the Chinese term applied to it, 'as dry as dust.' The change seems to have been gradual. As there were frequent slight shocks of earthquakes in the Great Plain of China in 1852—1853, Dr Macgowan suggests that these contributed to effect the phenomenon, another cause being neglect of the dykes by the imperial government. Its present channels are not precisely known, but they are probably the same as in ancient times; for it has shifted its bed at different periods of Chinese history. The vast quantity of sediment conveyed to the sea by this river, giving it its colour and name, is taken up in that part of its course which lies between the provinces of Shanse and Shense; beyond that region its waters are remarkably clear.

HY'ACINTH, a name given to the brilliantly coloured varieties of the gem called Zircon (q. v.); also to fine red Cinnamon-stone (q. v.) or Pyrope (q. v.); and sometimes to ferruginous quartz of a blood-red colour, which, from its occurring abundantly in gypsum at Compostella, in Spain, is called *H. of Compostella*.

HYACINTH (*Hyacinthus*), a genus of plants of the natural order *Liliaceæ*; bulbous-rooted plants with corolla-like, bell-shaped, 6-cleft perianth, six stamens fixed in the tube of the perianth, and dry capsular fruit.—The *Oriental H.* (*H. orientalis*), one of the most favourite of florists' flowers, is a native of Asia Minor, Syria, and Persia. It is now naturalised in some parts of the south of Europe. It has broad linear leaves, and a scape with a raceme of many flowers pointing in all directions. The flowers in cultivation exhibit great variety of colour, chiefly blue, purple, and white. They are very beautiful and very fragrant. The fragrance is strongest about or after eleven o'clock at night. Among cultivated hyacinths, are many with double flowers. The *H.* has been cultivated from a remote period, but about the beginning of the 18th c., it attained almost the first place as a florists' flower. Great attention was bestowed on the production of new varieties, and enormous prices were given for bulbs of some of them. A price equal to £200 sterling was sometimes paid for a single bulb. The principal seat of the cultivation of hyacinths was and still is at Haarlem. At present, however, more than £10 is seldom asked for the finest new variety of *H.*, but although the trade is considered as now much depressed, the Haarlem gardeners still sell bulbs to the value of £2000 or £3000 yearly. *H.* bulbs, planted in pots, readily produce beautiful flowers; and flowers almost equally beautiful are obtained—for one year, however, only—by placing

them in water in *H. glasses*, in which they form a favourite ornament of apartments in winter and early spring. In cultivating the *H.* in this way, rain-water should be used for filling the glasses in preference to spring-water. The roots should never be disturbed, if possible, and therefore the water should not be changed, but the glass must be filled up occasionally till it almost touch the bulb. A piece of charcoal may be placed in it to purify it. The glasses ought to be kept in a dark cool place till the bulbs have sent out roots. Hot rooms are apt to make the stems long and the flower-spikes small. The cultivation of the *H.* in the open ground is much more difficult, if the varieties are to be preserved from degenerating. A light sandy and yet rich soil is requisite. A compost of cow-dung, rotten leaves, and fine

Hyacinth in Glass and Support (Tye's).

sand is used at Haarlem. New varieties are raised from seed. Several other species of *H.* are natives of the south of Europe, Africa, &c.—The **GRAPE-HYACINTH** and **GLOBE-HYACINTH**, frequently cultivated as garden flowers, are now referred to the genus *Muscari*, of which the perianth is merely 6-toothed.—A common British plant, growing in woods and copses, with beautiful blue flowers very like those of the Oriental *H.*, but all drooping to one side (*H. non-scriptus*, also known as *Scilla nutans*, *Endymion nutans*, and *Agraphis nutans*), is sometimes called the **WILD H.**, and sometimes the **BLUE-BELL**. The bulbs were used in the time of Queen Elizabeth for starching the ruffs then worn, and the starch of them was otherwise used instead

of paste or glue. The fresh bulbs are said to be poisonous.

HYÆNA, a genus of digitigrade carnivorous quadrupeds, included in the genus *Canis* by Linnaeus, and by some naturalists referred to the family *Canidae*, but now more generally to *Viverridae*, whilst the dentition connects it even with *Felidae*. Hyænas have six incisors and two canine teeth in each jaw, five molars on each side in the upper jaw, and four in the under. They seize an object with so firm a hold, that, among the Arabs, they are proverbial for obstinacy. The vertebrae of the neck sometimes become ankylosed in old hyænas. The hind-quarters are lower and weaker than the fore-quarters of the body, so that hyænas move with a shambling gait. The body is covered with rather long coarse hair, forming a mane along the neck and back. The feet have each four toes. The claws are strong, fit for digging, and not retractile. The tail is rather short. Beneath the anus is a deep glandular pouch, contributing much to the offensive odour by which hyænas are characterised. Hyænas eat carrion, as well as newly-killed prey, and are of much use, like vultures, as scavengers, clearing away the last remnants of carcases that if left to rot would greatly pollute the air. They sometimes attack cattle, especially if they flee, but rarely man, though they sometimes seize children. During the day, they hide themselves in caves, old rock tombs, ruined edifices, &c.; by night, they roam singly or in packs in quest of prey. They prowl about towns and villages, and often dig up corpses that have not been very deeply buried. This, together with their aspect and manners, has caused them to be generally regarded with horror, and very exaggerated accounts of their fierceness have been prevalent. Instead of being untamable, as was long the popular belief, they are capable of being very completely tamed, and shew an attachment to man similar to that of the dog; they have even been used as watch-dogs. Hyænas are found only in Africa and the south of Asia, not extending to the furthest east of the latter

Striped Hyæna (*H. vulgaris*).

continent.—The **STRIPED H.** (*H. vulgaris* or *striata*) is found both in Asia and Africa, and there are several varieties considerably different in size, colour, &c. The smallest hyænas are of the size of a large dog.—The **SPOTTED H.** (*H. crocuta*) inhabits South Africa. It is rather smaller than the largest varieties of the Striped *H.*, but is more fierce and dangerous. It is called **TIGER-WOLF** by the colonists of the Cape of Good Hope. Besides its ordinary howling, which it emits very freely in its nocturnal roamings, this *H.* often indulges in an expression of gratification or of some passion, resembling hysterical laughter, whence it has acquired the name of the

LAUGHING HYÆNA. The general colour is ochry gray, with thinly scattered small round brown spots, and sooty muzzle and feet.—**THE WOOLLY H. (*H. villosa*)** is a smaller South African species.

In consequence of the bones which hyænas eat, their dung forms solid yellowish-white balls, of compact earthy fracture, the *Album græcum* of the old materia medica.

HYA-HYA. See **COW TREE.**

HYBERNATION. See **HIBERNATION.**

HYBODUS (Gr. *hump-tooth*), a genus of fossil fish, whose teeth and osseous fin-rays are found in all the Secondary rocks from the Trias to the Chalk inclusive. The genus, with the small family of Hybodonts to which it belongs, occupy a place between the Cestracions, with their pavement of flat crushing teeth, and the sharks with their sharp-pointed cutting teeth. The teeth of the Hybodonts are conical, but broad and blunt; from the body of the tooth rises a large central cone, and several small lateral ones, decreasing in size as they recede from the principal cone. The enamel is strongly marked by longitudinal grooves and folds. The osseous rays of the dorsal fins are the only other preserved portions of these fossils. Like the Port Jackson shark, the H. had each of the two dorsal fins furnished with a large and strong spine, one-third of whose length was buried in the flesh. Nearly fifty species of this genus have been described.

HYBRID (Gr. *hybrid*, from *hybris*, extravagance, licentiousness) is the term applied by naturalists to the offspring of different but generally nearly allied species of animals and plants, and must be distinguished from the word *mongrel*, which is applied to the offspring of different varieties of the same species.

M. Broca, whose memoir on Hybridity of Animals is the most complete that has yet appeared, remarks that this condition may be (1) natural, (2) excited (*provoquée*), or (3) artificial. The first variety is such as occurs spontaneously amongst animals in their wild state; the second includes those cases in which domesticated animals, which would not naturally cross with one another, do so under the influence of man, and in opposition to their natural instincts; while the third variety is due to the artificial admixture of the male and female generative elements, and as far as is yet known occurs only in fishes, and in the vegetable kingdom. The second variety is by far the most common and the most important.

When the male of the species A can impregnate the female of the species B, it may happen that the process can be inverted, and that the male B can impregnate the female A. In other cases, however, while the male A can readily impregnate the female B, the male B cannot impregnate the female A. In the first case, the hybridity is termed *bilateral*; in the second, *unilateral*. The former is rare, and even when it does occur, the cross in one direction is more common and more productive than in the other. Thus, the ordinary mule, the offspring of the male ass and the mare, is much more readily obtained, and, physiologically, is less imperfect than the corresponding animal, the hinny, which occasionally results from the union of the stallion and female ass. See **MULE**, **HINNY**. Our domestic sheep and goats afford an example of the latter (unilateral) kind of hybridity. The union of the he-goat and the ewe is frequently productive, while the union of the ram with the she-goat is always unproductive.

In the present state of our knowledge, it is impossible to predicate in what cases the crossing of different species will be productive, and in what

cases it will be barren. While some closely allied species do not admit of a cross, other species, far more removed from one another, not only yield hybrids, but even fruitful hybrids. There is, however, a limit, beyond which the chance of offspring becomes reduced to zero, and, according to Broca: 'If the crossing of animals of different genera is now an incontestable fact, there is no authentic evidence that offspring has resulted from the crossing of animals of different orders.'

Cases have been referred to, as shewing that animals of different orders may cross, but none of them are satisfactorily established. The strongest apparent case of hybridity between different orders is that of the *Jumarts*, which were said to result from the union of the bull and the mare, or of the stallion and the cow. These jumarts were believed in from the time of Columella to that of Buffon, who fully investigated the subject, and found that they were merely hinnies—the offspring of the stallion and the she-ass. Among mammals, hybrids have been obtained between the different species of the genus *Equus*. So far as experiments go, the horse, the ass, the zebra, the quagga, &c., breed freely *inter se*, but the degrees of fertility among their offspring have not been fully determined. The dog has been made to breed with the wolf and the fox, the lion with the tiger, the he-goat with the female sheep, the ram with the female roe-deer (*Cervus Capreolus*), and the hare with the rabbit. (See Professor Owen's article, 'Hybrid,' in Brande's *Dictionary of Science, Literature, and Art*.) A case has recently been recorded in *The Field* newspaper, in which a prolific union took place between a mastiff dog and a lioness that had been brought up together.

Among birds, hybridity is not uncommon. The swan will breed with the goose, the grouse with the blackcock, the pheasant with the common fowl, the goldfinch with the canary, &c. Among reptiles, hybrid offspring has been observed between the toad and the frog. Among fishes, hybrids have been obtained by artificial impregnation between different species of the genus *Cyprinus*.

Many hybrids have no propagative power, while in others it is so far limited as to admit only of reversion to the original specific form. When a hybrid possesses generative power, it breeds more readily with an individual of one of its parent stocks than with another hybrid like itself. The most remarkable example on record of generative power in hybrids is afforded by the experiments of M. Roux of Angoulême, who finds that he can cross hares and rabbits to any extent, and who has thus, by breeding *leporides*, established a new and lucrative department in agriculture. For a full account of these experiments, which are well deserving of a trial in this country, the reader may consult Brown-Sequard's *Journal de la Physiologie*, vol. ii. pp. 374—383. These experiments have inflicted a severe blow on the popular doctrine of the permanence of species.

Experiments on the hybridisation of plants have been very far from confirming the hybrid origin of forms apparently intermediate between other species, and which were once regarded as probably hybrids produced in a state of nature. The interference of man is usually necessary to effect an intermixture, and in many cases in which it has been found possible, it is, by no means of easy accomplishment. The predilection for pollen of the same kind appears to be very strong; and if pollen, both of the same and of another kind, is applied to the stigma of a flower, the result is the same as if its own pollen had been there alone. The hybridiser, therefore, must cut away the stamens of the flower of which

the pistil is to be impregnated, and carefully prevent all access of pollen other than that which he brings to it. Even with these precautions, it is found impossible to produce hybrids between some plants of the same family, and not very dissimilar.

Hybrid plants are said to partake generally of the characters of the male more than of the female parent. It is more certain that valuable results are often obtained as to size and abundance of fruit, brilliancy of flowers, hardiness, and other qualities. The question of the continued fertility of true hybrids is one having most important relations to the great questions concerning species. Some assert that neither among animals nor among plants are hybrids fertile for more than one or two generations, if kept by themselves; although they are readily fertile with either of the parent species, to which they become again assimilated. But this opinion is controverted, and the question must, of course, be decided by observation of facts, in judging of which, however, questions of no little difficulty must often arise as to what are and what are not different species.

The subject of the hybridisation of plants was first investigated, and with great care and very numerous experiments, by Kölreuter, in the end of the 18th c., and has been more recently studied with much attention by Dean Herbert of Manchester, Van Mons, and particularly Gaertner.

HYDASPES. See JEJUM.

HYDATID (from the Greek *hydatis*, a watery vesicle), a term indefinitely applied to several distinct objects of a vesicular or cyst-like character, which are found in the bodies of men and certain mammals. True hydatids were formerly regarded as cystic Entozoa (q. v.), such as *Cysticercus*, *Cœnurus*, and *Echinococcus*, but all these animal forms are now discovered to be larval stages of tænia or Tape-worm (q. v.). These hydatids may occur in almost any part of the body, and they have been observed in man, the ape, the ox, the

the organ in which it is situated, and which is frequently common to many hydatids, each of which has a distinct envelope. The fluid in the interior of the hydatid itself is almost always colourless and limpid, but the fluid in the common cyst in which the hydatids float is often of a yellow colour. The *Cœnurus cerebralis* is found in the brain of various ruminants, and gives rise to the disease in sheep known as 'the staggers.' When the hydatid occurs in the fourth ventricle, the animal, instead of turning round and round in one direction, springs in the air, and this variety of the affection is hence distinguished by German veterinarians as *das Springen*. Whenever any of the above forms of hydatids are swallowed by man or the lower animals, they may proceed, under favourable circumstances, to be developed into the higher stages of tape-worm. Two species of *Echinococcus* are usually noticed, namely, the *E. hominis*, which has been occasionally met with in the brain and abdomen of man, and the *E. veterinorum*, which is of common occurrence in various parts of the body of the pig, and several other mammals, but it is by no means certain that they are really distinct. These *Echinococci* do not become developed into tape-worms unless they reach the intestinal canal of some animal, by being taken as food; and in ordinary cases of hydatids, consisting of *Echinococci*, the cysts and their contents undergo a kind of degeneration, becoming in some cases converted into fatty or calcareous matter, while in other cases the contents become granular, the peculiar hooklets (which will be described in the article TAPE-WORM) which occur in them, and which remain unaltered for a long time, revealing their true origin.

The so-called acephalocyst, or common globular hydatid, which sometimes attains the size of a child's head, is probably a degenerated or abnormally developed *echinococcus*.

Hydatids sometimes occasion so little inconvenience, that persons, in whom they are discovered after death, have not suspected any disease in the organ in which they are found. On other occasions, they grow rapidly, and cause so much irritation that suppuration is excited in or around the common sac, which may either burst externally, or into a mucous canal or a serous cavity. In the first or second case, the hydatids will be discharged, and recovery may take place; in the third case, fatal inflammation will ensue. Little can be done for the treatment of this affection, except that occasionally, if the cyst is near the surface, it may be carefully punctured. The means of preventing the affection will be noticed in the article TAPE-WORM.

False hydatids are simple serous cysts, either occurring alone or in clusters, whose mode of origin is not distinctly understood. Structures of this kind, on a small scale, are common in the choroid plexus of the brain, while on a large scale they are found containing the fluid in ovarian dropsy. These false hydatids are also of comparatively common occurrence in the uterus, which they may distend to such a size as to simulate pregnancy.

HYDE, an important manufacturing town of England, in Cheshire, is situated seven miles east-south-east of Manchester, and about the same distance south-east of Oldham. Until a comparatively recent period, it was a mere village; but since the extension of the cotton-trade, on which it mainly depends, it has rapidly increased in size. Its population in 1861 was 13,722. Besides the numerous cotton-factories, iron, water, and print works are carried on. Coal abounds in the neighbourhood. The district in which H. is situated is densely peopled, and is furnished with abundant means of

Hydatids:

Copied from Rymer Jones's *Animal Kingdom*.

- 1, *Cœnurus Cerebralis*, natural size; 2, one head magnified; a, oval circle of hooks; b, suckers; 3, *Cysticercus Tenuicollis*, natural size; 4, head magnified; a, circle of hooks; b, suckers.

sheep, the horse, the camel, the pig, the kangaroo, and some other vegetable feeders, but they apparently do not occur in carnivorous animals or in the rodents. They are generally enclosed in an external sac, which is attached to the tissue of

communication, by railway and canal, with all the important towns in the vicinity.

HYDE, EDWARD. See CLARENDON, EARL OF.

HYDE PARK, a noble enclosure of nearly 400 acres, extending from the western extremity of London to Kensington Gardens, which derives its name from having been the manor of the Hyde belonging to the Abbey of Westminster. It became the property of the crown on the dissolution of the monasteries, in the reign of Henry VIII. A canal or sheet of water, called the Serpentine, although in the form of a parallelogram, was made in H. P., between 1730 and 1733, by order of Queen Caroline. At the eastern end of it is an artificial waterfall, constructed in 1817. On the south side are the barracks of the Life-guards. It was in H. P. that the great International Exhibition of 1851 was held, in a Crystal Palace specially erected for the occasion. We do not clearly learn at what time the public began to have free admission to Hyde Park. But Ben Jonson speaks of the show of coaches which it presented in his time; and we know that it was constantly resorted to on the morning of May-day for the sports comprehended under the term Maying. Till the middle of the 17th c., there was a part of it which contained deer. About that time, it began to be a place for races and military reviews. It was also resorted to for duels. After the Restoration, it appears to have become the favourite promenade, which it has ever since continued to be. It has, however, undergone many changes of boundary and division; large part of Kensington Gardens have been taken from it, also an angle at the south-east corner on which Apsley House now stands.

HYDER ALI, ruler of Mysore, and one of the greatest Mohammedan princes of India, was born in 1728. His father, who was a general of the Rajah of Mysore, afterwards obtained Bangalore in fief, and both of these honours descended to his son. H. A., in 1759, dispossessed his master, allowing him, however, to retain his title, while he himself took that of *daiva*, or regent. He then conquered Calicut, Bednor, Onor, Cananor, and other neighbouring states; and in 1766, his dominions included more than 84,000 square miles. He waged two wars against the British, in the first of which he was completely successful, and dictated terms of peace under the walls of Madras, but died before the termination of the second, in which he was aided by the French. He also joined in a native confederacy for the expulsion of the British from India. He, besides, withheld the customary tribute from the Mahrattas (q. v.), and waged a successful war against them. In his wars he displayed great resolution and perseverance. He died in 1782. H. A. was remarkable amongst Asiatic princes for the mildness of his character and government, and was much beloved by his people. He promoted agriculture, commerce, and the arts, and protected all religions, requiring only submission to his laws. His son and successor was Tippoo Saib (q. v.).

HYDERABA'D, more properly HAIDARABAD (from *Haidar*, lion; and *bad*, town), the capital of the Nizam's Territories (q. v.), stands on the right bank of the Musshi, in lat. 17° 22' N., and long. 78° 32' E., at an elevation of 1800 feet above the sea, and contains, with suburbs, 200,000 inhabitants. On the opposite side of the river is the British Residency, the stream being here bridged by nine spacious arches of squared granite. Besides these erections and the palace of the native sovereigns, we may mention the principal mosque which has been fashioned after the model of the Kaaba at Mecca; while at the meeting of the four principal streets of the city rises another remarkable

edifice, with four minarets resting on four connected arches, on which run the four converging thoroughfares. The neighbourhood abounds with huge tanks. One of them, close to the British cantonment of Secunderabad, measures three miles by two; and another, still larger, is said to be twenty miles round.

HYDERABAD, the chief city of Sind, stands four miles to the east of the left bank of the Indus, in lat. 25° 22' N., and long. 68° 28' E. Pop. about 24,000. The place is famous for the manufacture of arms of various kinds, such as matchlocks, swords, spears, and shields. As against a native force, it is tolerably strong, occupying a somewhat steep height, and having a rampart flanked by round towers.

HYDNUM, a genus of fungi (*Hymenomyces*), having the under side of the *pileus* covered with soft spines which bear the spores. The species are pretty numerous, some of them British; among which is *H. repandum*, more common in some parts of the continent of Europe, and much used as an esculent in France, Italy, and Germany. It grows on the ground, chiefly in pine and oak woods, either solitary, or in clusters or rings.

HYDRA, THE, or Fresh-water Polype, is the type of the class HYDROZOA, which, with the ANTHOZOA, form the sub-kingdom *Celenterata* of recent zoologists. See ZOOPHYTES.

The H. possesses a gelatinous, sub-cylindrical body, which, from its contractility, undergoes various alterations of form. One end expands into a disc or foot, which adheres to a leaf, twigs, &c.; while a mouth, surrounded by a circlet of tentacles, varying from five to twelve or more in number, is situated at the opposite end. These tentacles are exceedingly contractile, at one moment thrown out as long delicate threads, at the next, drawn up into minute wart-like knobs. Numerous thread-cells project from their surface, the larger ones possessing a sheath and three recurved darts or barbs, and terminating in a long and extremely slender filament. The mouth leads into a capacious cavity, excavated throughout the whole length of the animal, which, exclusive of its tentacles, seldom exceeds three-fourths of an inch. On minutely examining the H., or any member of the class Hydrozoa, the body is found to be composed of two membranes, an ectoderm and an endoderm, the former constituting the outer layer of the animal, and having one side always in contact with the water, while the other side is in close contact with the endoderm, whose free surface forms the lining of the great internal cavity. The food of the H. consists

Hydnum.

Hydra:

a, Hydra Vulgaris, attached to a piece of stick—a young polype is sprouting from the side of the parent animal; *b*, one of the larger thread-cells, with its three recurved barbs.

of such minute living organisms as come within the reach of its tentacles, and by these apparently fragile threads, which the animal projects like a lasso, crustaceans, worms, &c., are seized, which

would be deemed at first sight superior to their captor in strength and activity. The tentacles appear, however, to possess, through the action of the thread-cells, a powerful benumbing or paralyzing influence, for it has been observed that soft-bodied animals which have succeeded in escaping from the grasp of the H. frequently die very shortly. The prey, when mastered, but often when still alive, is thrust into the internal cavity, where the nutritive parts are absorbed by the H., while the indigestible portions are expelled through the mouth.

Although the H. is usually found adhering by its circular foot or disc to submerged leaves, twigs, &c., it is not permanently fixed. It often moves on surfaces under water somewhat after the manner of a leech, both ends taking a part in the movement, and occasionally the disc is protruded above the water, and thus acts as a float.

Sometimes, especially in the autumn, true reproductive organs may be observed, both male and female organs being usually situated on the same animal. Propagation by gemmation is, however, the most common mode of increase. Minute tubercles appear on the body of the parent animal, which, as they increase in size, gradually resemble it; becoming perforated at their free extremity, and tentacles gradually being formed. The pedicle by which they originate by degrees becomes thinner, and finally gives way, leaving the young H. perfectly independent. One of the most remarkable points in the history of this animal is its power of being multiplied by mechanical division. If a H. be cut into two, or even more pieces, every one will, in time, assume the form and functions of the original animal.

Several species of H., such as *H. viridis*, *H. vulgaris*, *H. fusca*, &c., have been described, which differ in size, colour, &c. When living hydræ are removed from the water, they appear like minute specks of jelly, which quickly recover their true form on being restored to their proper element. The great authority on these singular animals is Trembley, whose *Mémoires pour servir à l'histoire d'un Genre de Polypes d'eau douce* was published in 1744.

HYDRA, a fabulous monster of the ancient world, said to have inhabited the marshes of Lernæa, in Argolis, not far from the sea-coast. Accounts vary both as to its origin and appearance. Some make it the issue of Styx and the Titan Pallas, and others, of Echidna and Typhon. It is represented as having several heads, which immediately grew up again as often as they were cut off. The number generally ranged from seven to nine, though Simonides gives it fifty, and certain historians a hundred, and even more. Its mouths, which were as numerous as its heads, discharged a subtle and deadly venom. The destruction of this reptile was one of the twelve labours of Hercules (q. v.).

HYDRA, an island of Greece, is situated off the eastern shore of the Peloponnesus (now the Morea), about 5 miles distant from the coast of the department of Argolis and Corinth. It is about 13 miles long, and 3 miles broad, and has an area of 38 square miles. The shores are rocky and steep, and the interior, rising to about 1800 feet in height, is destitute of vegetation and of water. On the north-west coast is the town and seaport of Hydra, the white, flat-roofed houses of which, ascending from the harbour, climb up the side of a hill. The streets, owing to the irregularity of the site, are steep and uneven, but remarkably clean. This town, the only one in the island, is one of the most beautiful in the whole of Greece. Pop. 12,000, who are chiefly employed in cotton and silk weaving, in tanning, and in commerce.

The island of H. was uninhabited in ancient

times. The nucleus of the town was formed by a few fishermen and peasants, who, suffering from the oppression of the Turks, crossed over from the neighbouring mainland, and were afterwards followed by crowds from Albania, Argolis, and Attica, in the 15th and 16th centuries. In the Grecian war of independence, the Hydriotes took a most active part; and none were more liberal in their contributions to the patriotic cause. In 1825, the population was estimated at 40,000, and about that time the islanders were considered the richest in the archipelago. They possessed exclusively the carrying-trade of the Black Sea and the Mediterranean, and traded to England, the Baltic, and even America. Since the revolution, however, more accessible ports have risen to be the centres of Greek commerce, and H. has considerably declined.

HYDRA/CIDS, or **HYDROGEN ACIDS**, a name given to acids in which the acidifying principle was supposed to be hydrogen. See **ACIDS**. The division of acids into *oxyacids* and *hydracids* belongs rather to a past than to the present state of chemistry.

HYDRAGOGUES are those active purgatives which produce a great flux from the intestinal membrane, and which consequently give rise to very watery stools. They are of extreme use in some of the varieties of dropsy, being the most effectual means of diminishing the liquid poured into the cellular tissue and serous cavities of the body.

Jalap (especially when combined with bitartrate of potash) and elaterium, a medicine which, from its extreme power, must be given in very small doses (one-eighth to one-third of a grain), and with great caution, are perhaps the best examples of this class of purgatives.

HYDRA'NGEA, a genus of plants of the natural order *Hydrangeaceæ*, which many botanists make a sub-order of *Saxifragæ*, distinguished by having 4–6 petals, 8–12 or many stamens, a more or less inferior ovary, and 2–5 styles. *Hydrangeaceæ* are shrubs with opposite, or sometimes whorled leaves, destitute of stipules. In the genus *H.* the flowers are in cymes, the exterior flowers sterile and dilated. Few species are known, and they are chiefly natives of the southern parts of North America, and of China and Japan. The species popularly known as the **HYDRANGEA** (*H. hortensia*), is a native of China and Japan, and has long been in cultivation there as an ornamental plant. It was introduced into Britain by Sir Joseph Banks in 1788, and speedily became very popular, being readily propagated by layers and cuttings, so as to be not only a favourite green-house plant, but a frequent ornament of cottage windows. In the south of England, it endures the open air. It seems almost impossible to water it too freely; a large plant has been known to receive with advantage one hundred gallons of water daily; and in favourable circumstances, it becomes a magnificent shrub. A plant in Devonshire has had 1000 large cymes of flowers expanded at once. The flowers, generally pink, are sometimes blue; the blue colour is owing to peculiarities of soil. Peat and iron ore are said to be productive of blue flowers in the *Hydrangea*.—*H. Japonica*, introduced into Europe from Japan by Siebold, is remarkable for its very large cymes of flowers.—*H. nivea* and *H. quercifolia*, American species, are not unfrequently to be seen in flower-gardens in North America.

HYDRATES are substances in which a definite quantity of water is chemically combined with a definite quantity of some other constituent. Although water is a perfectly indifferent substance, possessing neither acid nor basic properties, yet it enters into combination both with acids and with

bases, and thus forms the bodies termed hydrates. Thus, when an acid has once been allowed to combine with water, the entire separation of the water can usually only be effected by the presence of some strong base, which displaces the water. If, for example, we distil diluted sulphuric acid, water is expelled up to a certain point, when both acid and water are distilled together. The liquid now contains one equivalent of water, and one of acid (HO, SO_3), and is termed hydrated sulphuric acid, and this equivalent of water can only be displaced by an equivalent of potash, or some other base. Water which thus supplies the place of a base in combination with acids is termed basic water. Hydrate of baryta (BaO, HO), hydrate of lime or slaked lime (CaO, HO), hydrate of sesquioxide of iron ($\text{Fe}_2\text{O}_3, 3\text{HO}$), and hydrate of oxide of copper (CuO, HO), are similar cases, except that here the water is displaced by an acid instead of a base. The above are examples of hydrates of acids and bases or oxides. Gypsum ($\text{CaO}, \text{SO}_3, 2\text{HO}$) is an example of a hydrate of a salt.

HYDRAULIC LIMES AND MORTARS. See CEMENTS.

HYDRAULIC PRESS, called also Bramah's Press, from the name of its inventor, depends on the principle, that a pressure exerted on any part of the surface of a liquid is transmitted undiminished to all parts of the mass, and in all directions. See HYDROSTATICS. The annexed figure represents the essential parts of the machine, the details of construction being omitted. F is the

cavity of a strong metal cylinder E, into which the piston, D, passes watertight through the top. A tube, G, leads from the cylinder to a force-pump H; and by means of this, water is driven from the tank T into the cavity F, so as to force the piston, D, upwards. The piston supports a table on which are placed the bales, books, or other articles to be pressed; and the rising of the table presses them against the entablature AA, which is fastened to the pillars B, B. The power of the press is readily calculated. Suppose that the pump has only one-thousandth of the area of F, and that, by means of its lever-handle, the piston of the pump is pressed down with a force of 500 pounds, the piston of the barrel will rise with a force of one thousand times 500 pounds, or more than 200 tons. The rise, however, will be slow in proportion to the power. The enormous multiplying power given by this machine has been employed for a great variety of useful purposes, such as compressing bales of cotton, paper, tobacco, wool, &c., for expressing oil from seeds, and raising weights. This was the means employed for launching the *Great Eastern* at Millwall, and for raising to their position the tubes of the Britannia Bridge.

HYDRAULIC RAM, a simple and conveniently applied mechanism, by which the momentum or weight of falling water can be made available for raising a portion of itself to a considerable height. In the annexed figure, which represents a section of Montgolfier's hydraulic ram, R is the

reservoir from which the water falls, RS the height of the fall, and ST the horizontal tube which conducts the water to the engine ABHTC. E and D are two valves, the former of which closes its cavity by ascending, the latter by descending; and FG is a pipe reaching within a very little of the bottom CB. The valves are such that the water at its normal pressure cannot support their weight; the valve E is prevented from falling below a certain point by a knob above mn. When the water is allowed to descend from the reservoir, after filling the tube BHS, it rushes out at the aperture mn, till its velocity in descending RST becomes so great as to force up the valve E, and close the means of escape. The water being thus suddenly checked,

and unable to find a passage at mn, will produce a great action on every part of the containing vessels, and by its impact raise the valve D. A portion of water being admitted into the vessel ABC, the impulse of the column of fluid is expended, the valves D and E fall; the opening at D being thus closed, and that at mn opened. The water now rushes out at mn as before, till its motion is again stopped by its carrying up the valve E, when the operation is repeated, the fluid impulse opening the valve at D, through which a portion of the water passes into ABC. The valves at E and D thus alternately closing and opening, and water at every opening of D making its way into ABC, the air therein is condensed, for it has no communication with the atmosphere after the water is higher than the bottom of the pipe FG. This condensed air, then, exercises great force on the surface, op, of the water, and raises it in the tube, FG, to a height proportioned to the elasticity of the imprisoned air. The principles of the hydraulic ram are susceptible of a very extensive application. In well-constructed rams, the mechanical effect obtained should be from 65 to 75 per cent. of the force supplied. For raising comparatively small quantities of water, such as for single houses, farmyards, &c., the ram is the best mechanism yet introduced. But the concussion, and consequent deterioration of the valves, places a limit to the use of the mechanism when applied to raise large quantities.

HYDRIDÆ, a family of serpents, sometimes so defined as to include numerous fresh-water snakes

Banded Sea Snake (*Chersydrus Fasciatus*):
a, head; b, part of back.

which are not venomous, and sometimes limited to venomous sea-serpents, inhabiting the Indian

Chinese, and tropical Australian seas. These serpents, forming the genus *Hydrophis* (or *Hydrus*), and other genera recently separated from it, have the tail compressed and the belly keeled, so that they have the power of swimming like eels; they have small heads and small eyes; they are remarkable for the large size of their nasal shields; they are generally of a yellowish-green colour, varied with blackish rings or lozenge-shaped spots. Their lungs are often prolonged into a reservoir of air as far as the commencement of the tail. They are often from two to five feet long. They are frequently seen asleep on the surface of the sea, and are easily caught in this condition, in which, apparently, they often fall a prey to sharks. They are supposed to live on small fishes and crustaceans. They are sometimes found coiled up among seaweed on the shore, and are much dreaded by fishermen. In some places, they are very numerous. One species, at least, is esteemed good food by the Tahitians. More than fifty species are known.

HYDRIDES. This term is applied both to combinations of hydrogen with metals, and to similar combinations with organic or compound radicals. Hydrogen forms hydrides with at least four metals—viz., arsenic, antimony, copper, and potassium. The first two of these are the well-known gases, arseniuretted hydrogen (AsH_3) and antimoniuiretted hydrogen (SbH_3). The hydride of methyl or marsh-gas ($\text{C}_2\text{H}_5\text{H}$), and the hydride of ethyl ($\text{C}_4\text{H}_5\text{H}$), are examples of the second variety of hydrides.

HYDROCARBONS. See CARBOHYDROGENS.

HYDROCELE (Gr. *hydor*, water, and *kēlē*, a swelling) is the medical term for a dropsy of the tunica vaginalis, a serous membrane or sac investing the testis. Hydrocele occurs as a smooth, pear-shaped swelling, fluctuating when pressed, devoid of pain or tenderness, but sometimes causing a slight uneasiness from its weight.

The quantity of serous fluid in the sac is usually from six to twenty ounces, but it occasionally exceeds a hundred ounces. Hydrocele may occur as a result of acute inflammation, but it most commonly comes on without any apparent local cause. It is most frequently met with about or beyond the middle period of life, and generally in persons of feeble power, or with a tendency to gout; sometimes, however, it occurs in young children, either in the same form as in adults, or as what is termed *congenital hydrocele*, when the communication between the tunica vaginalis and the abdominal peritoneum is not obliterated, as it normally should be.

The treatment is divided into the *palliative* and the *curative*. By the former, the surgeon relieves the present annoyance of his patient, while by the latter he aims at the permanent removal of the disease. The palliative treatment consists in the use of suspensory bandages, evaporating and discentient lotions, and tapping with a fine trochar. Tapping seldom gives more than temporary relief, the swelling usually again regaining its former bulk in three or four months.

The curative treatment consists in setting up sufficient inflammation in the tunica vaginalis to destroy its undue secreting faculty. This is most commonly done by the injection of tincture of iodine into the sac, or by the passage of a fine seton or an iron wire (as proposed by Dr Simpson) through it.

HYDROCEPHALUS. Under this term, which literally means *water in the head*, are included three distinct diseases—viz., acute hydrocephalus, chronic hydrocephalus, and spurious hydrocephalus, or, as Dr Marshall Hall termed it, hydrocephaloid disease.

By *Acute Hydrocephalus* is signified inflammation

of the brain as it usually occurs in scrofulous children. The name is not a good one, because it merely refers to a frequent effect of the disease, and not to its cause or essence; and because, further, a similar effect may result from other morbid conditions: it is, however, so universally adopted, that it would be inexpedient to change it. The disease is one of so dangerous a nature, that it is of the greatest importance to detect it in its earliest stage, and even to look out for indications of its approach. The premonitory symptoms (which, however, do not occur in all cases) consist chiefly in a morbid state of the nutritive functions. The appetite is capricious, the tongue foul, the breath offensive, the belly enlarged, and sometimes tender, and the evacuations unnatural; and the child is heavy, languid, and dejected, and becomes either fretful and irritable, or drowsy and listless. Restless sleep, attended by grinding of the teeth or moaning, a frequent sudden scream, clenching of the fists, and a turning in of the thumb towards the palm of the hand, are also important premonitory warnings.

After these symptoms have lasted for some days, severe pain in the head comes on; it is generally of a sharp shooting character, recurring at intervals, and often during sleep, and causing the child to shriek in a very characteristic manner. Coma or morbid drowsiness now supervenes, and the shrieking is replaced by moaning. Vomiting is a frequent concomitant of this stage of the disease. In this first stage of hydrocephalus, which most commonly lasts two or three days, the pulse is rapid, and the symptoms generally are those of excitement. In the second stage, the pulse becomes irregular, variable, and often slow. General heaviness and stupor come on. The light, which annoyed the child in the first stage, is no longer a source of annoyance; the pupils become dilated, the power of sight becomes imperfect or lost, and squinting is almost always to be observed. The little patient now lies on his back in a drowsy condition; and at this period spasmodic twittings, convulsions, or paralysis may come on. The excretions are passed unconsciously. This second stage may last a week or two, and is often attended by deceptive appearances of amendment, the child not unfrequently regaining the use of its senses for a day or two, but then relapsing into a deeper stupor than before. The symptoms in the third or last stage, which may last only a few hours, or may extend to a fortnight, are very similar to those in the second, except that the pulse again becomes very rapid, beating sometimes so quickly that it can scarcely be counted, and gradually gets more and more weak, till the patient expires. The characteristic appearances after death are softening of the central part of the brain, with the effusion of serous fluid, usually to the extent of several ounces, into the ventricles; and a tubercular deposit, in the shape of small granules, upon or between the membranes of the brain.

The only disorder with which acute hydrocephalus can easily be confounded is infantile remittent fever; but we have not space to notice the various points which enable us to discriminate between these two complaints. Acute hydrocephalus is essentially a disease of childhood; it scarcely ever occurs after the twelfth year. Half the cases that occur are in children between three and six years of age.

As the treatment should be left entirely to the physician, it is unnecessary to notice it further, than to state that strong antiphlogistic remedies—such as cold to the head, leeching, and active purging—applied in the first stage of the disease, yield the most satisfactory results; yet under this treatment, three cases out of four are lost.

Chronic Hydrocephalus is a perfectly distinct disease from acute hydrocephalus; while the latter is an inflammation, the former is a dropsy. In chronic hydrocephalus, a watery fluid collects within the skull, before the bones have united to form the solid brain-case, and by pressure outwards causes the bones to separate, and increases the size of the head sometimes to an enormous extent. Thus Dr David Monro relates the case of a girl six years old whose head measured two feet four inches in circumference. While the skull is rapidly enlarging, the bones of the face grow no faster than usual, and the great disproportion of size between the head and the face is at once diagnostic of the disease. This disorder sometimes commences before birth, and almost always in early childhood, before the fontanelles and sutures of the skull have closed. In some rare cases, it has occurred later, as, for example, at seven or nine years old, and the closed sutures have opened under the augmenting pressure. When the sutures will not yield, death from pressure on the brain speedily ensues. Most children with chronic hydrocephalus either recover or die in infancy; but a few survive, bearing their complaint to adult life, or even to old age. Blindness, deafness, palsy, and idiocy—one or more—are commonly associated with this disease, but occasionally the intellect and senses are sufficiently perfect for the ordinary requirements of social life.

The treatment may be attempted by internal remedies or by surgical appliances. The medical treatment most worthy of trial consists in the administration of diuretics, purgatives, and especially mercury, which may be given in the form of calomel in minute doses, and applied as ointment externally. The surgical expedients are bandaging and puncturing the head. The former has in some cases effected a permanent cure; the latter has in many cases certainly prolonged life, although the disease has finally conquered. Neither of these means is applicable after the bones of the skull have united.

This disease occasionally occurs in adult or in advanced life, after enlargement of the head has become impossible. Stupor, paralysis, and an inability or unwillingness to speak, are in these cases the most prominent symptoms. Dean Swift's death was due to this disease, and it is recorded that during the last three years of his life he remained in a state of silence, with few and slight exceptions.

Spurious Hydrocephalus—the *hydrocephaloid disease* of Dr Marshall Hall—resembles acute hydrocephalus in many of its symptoms, and has often been mistaken for it. Instead, however, of being an inflammatory disease, it is a disease of debility, and is due to a deficient supply of blood to the brain. The following are, according to Watson, the distinctive characters of this spurious hydrocephalus: the pale, cool cheek; the half-shut, regardless eye; the insensible pupil; the interrupted, sighing respiration; and the state of the unclosed fontanelle. If the symptoms are those of acute hydrocephalus, the surface of the fontanelle will be convex and prominent; while if they are due to spurious hydrocephalus, and originate in emptiness and want of support, the fontanelle will be concave and depressed. The remedies in this disease, which readily yields to treatment, are nourishing diet, small doses of wine or even of brandy in arrow-root, decoction of bark, ammonia, &c.

HYDROCHARIDEÆ, or HYDROCHARIDA'CEÆ. See ANACHARIS and VALLISNERIA.

HYDROCHLO'RIC ACID (symbol, HCl; equivalent, 36·5) is one of the most important compounds in inorganic chemistry. If the two gases which enter into its composition (hydrogen

and chlorine) be mixed in equal volumes, they will remain without action upon each other, if kept in the dark; but as soon as they are brought into direct sunlight, they unite with a loud explosion, and hydrochloric acid gas is the result. The principal characters of this gas are, that it is colourless, intensely acid, irrespirable, and even when largely diluted, is very irritating to the lungs and eyes, and very injurious to vegetation; that it is heavier than air (its specific gravity being 1·2474, air being taken at 1·000); that it can be condensed into a colourless liquid; that it is very soluble in water, and that it is neither combustible nor a supporter of combustion. When allowed to escape into the air, it produces white fumes, by condensing the atmospheric moisture. If the air be previously dried, no such fumes are apparent.

The solutions of this gas in water form the acid which was first known as *Spirit of Salt*, then as *Muriatic Acid*, and which is now termed *Hydrochloric* or *Chlorhydric Acid*. A saturated watery solution of this gas at 40° has a specific gravity of 1·21, and consists of 1 equivalent of the gas dissolved in 6 equivalents of water. It forms a colourless, fuming liquid, which acts as a caustic. On heating it, the gas is evolved abundantly until the temperature slightly exceeds 212°, when there distils over a diluted solution, having a specific gravity of 1·1, and consisting of 1 equivalent of the gas, and 16 equivalents of water. It is to these solutions of hydrochloric acid that the term *hydrochloric acid* is far more commonly applied than to the gas itself. They possess the ordinary characters of an energetic acid, and neutralise the strongest bases. The neutralisation is, however, not in consequence of the acid combining with the oxide, but is due to the simultaneous decomposition of the acid and of the oxide, water and a metallic chloride being formed. If M represents the metal, the reaction is expressed by the equation $MO + HCl = MCl + HO$. All metals which, at a red heat, decompose water, also decompose this acid, and cause an evolution of hydrogen, the reaction being expressed as follows: $M + HCl = MCl + H$.

Hydrochloric acid gas is a common gaseous volcanic product. Free hydrochloric acid, in a very dilute form, is also a constituent of the gastric juice of man and animals, and plays an essential part in the digestive process.

Commercial *muriatic acid*—to use the name employed by manufacturing chemists—is made by heating, in iron cylinders, common salt (chloride of sodium) and oil of vitriol (hydrated sulphuric acid), and condensing the evolved gas in water contained in a series of stoneware Wolfe's Bottles (q. v.), the reaction being explained by the equation:

This commercial acid may contain various impurities—as, for example, iron (which gives it a bright deep yellow colour), the chlorides of sodium and arsenic—the latter being derived from the oil of vitriol—sulphuric and sulphurous acids, chlorine, &c.; from which it can be purified to a great extent by dilution and redistillation. 'If pure,' says Professor Miller, 'the acid should leave no residue when evaporated; on saturating it with ammonia, it should give no precipitate of oxide of iron; sulphuretted hydrogen should produce no turbidity in it, which would be the case if arsenic, free chlorine, or sulphurous acid were present; and on dilution with three or four times its bulk of water, no white cloud of sulphate of baryta should be produced by the addition of chloride of barium.'

The presence of hydrochloric acid, or of the

soluble chlorides in solution, may be detected by the addition of a few drops of a solution of nitrate of silver, which occasions the formation of a white curdy precipitate of chloride of silver, which is insoluble in nitric acid, but dissolves in a solution of ammonia.

Liquid hydrochloric acid (under the name of spirit of salt) was known to the alchemists. Hydrochloric acid gas was discovered by Priestley in 1772; and Davy, in 1810, ascertained that it was composed of chlorine and hydrogen.

In many of their properties, the analogous acids, hydrobromic, hydrofluoric, and hydriodic acids resemble hydrochloric acid.

HYDROCOTYLE, a genus of umbelliferous plants, having simple umbels, entire acute petals, and fruit of two flat orbicular carpels, with five more or less distinct threadlike ribs, and no vittæ. The species are numerous, generally more or less

Marsh Pennywort, or White-rot (*Hydrocotyle vulgaris*).

aquatic, widely distributed. One only is a native of Britain, *H. vulgaris*, which grows in marshy places, and is called MARSH PENNYWORT from the orbicular leaves, and sometimes White-rot, Sheepsbane, Flowk-wort, &c., from a notion that it is injurious to sheep which eat it, causing foot-rot or fluke-worm—effects rather to be ascribed to the marshy situations in which it grows.

HYDROCYANIC ACID ($C_2N_2H_4$ or Cy,H), known also as Prussic Acid, from its having been first obtained by Scheele, in 1782, from the substance known as Prussian or Berlin Blue, is of almost equal interest to the chemist, the physician, and the toxicologist. We shall notice (1) its chemistry, (2) its medicinal value, and (3) its action as a poison, and its antidotes.

1. *Its Chemistry*.—Pure anhydrous hydrocyanic acid is a limpid volatile fluid, with a specific gravity of 0.697 at 64° F. It boils at 80°, and solidifies into a crystalline mass at 5° F. Its volatility is so great, that if a drop be allowed to fall on a piece of glass, part of the acid becomes frozen by the cold produced by its own evaporation. It possesses a very penetrating odour, resembling that of peach-blossoms or oil of bitter almonds. It burns with a whitish flame, reddens litmus paper slightly (its acid properties being feeble), and is very soluble in water

and alcohol. Pure hydrocyanic acid may be kept unchanged if excluded from light, which occasions its decomposition, and the formation of a brown substance known as paracyanogen.

Hydrocyanic acid is readily obtained by distillation from the kernels of bitter almonds, and many kinds of stone-fruit, from the leaves and flowers of various plants, and from the juice of the tapioca plant (*Jatropha manihot*). Anhydrous hydrocyanic acid is obtained by the reaction of concentrated hydrochloric acid on cyanide of mercury.

The preparation of the dilute acid is, however, of much greater practical importance. The London, Edinburgh, Dublin, and United States pharmacopœias agree in recommending that it should be obtained by the distillation of a mixture of dilute sulphuric acid and ferrocyanide of potassium (known also as prussiate of potash). The distillate should contain nothing but hydrocyanic acid and water, so that, by the addition of more water, we can obtain an acid of any strength we please. Sometimes, however, a second, or even a third distillation is necessary. The dilute acid of the *Ph. Lond.* contains 2 per cent.; that of the *Ph. Dub.* rather more; that of the *Ph. Edin.* contains 3.3 per cent.; while what is known as Scheele's acid is very variable, but averages 4 per cent. of the anhydrous acid.

The ordinary tests for hydrocyanic acid are 1, the peculiar odour; 2, the nitrate of silver test—there being formed a white precipitate of cyanide of silver, which is soluble in boiling nitric acid; 3, the formation of Prussian blue, by adding to the fluid under examination a solution of some proto- and per-salt of iron, by then saturating with caustic potash, and finally adding an excess of hydrochloric acid; when, if hydrocyanic acid is present, we have a characteristic blue precipitate; 4, the sulphur test, which is the best and most accurate that has yet been discovered. Let the suspected liquid be acidulated with a few drops of hydrochloric acid; place it in a watch-glass, and let a second watch-glass, moistened with a drop of a solution of hydro-sulphate of ammonia, be inverted over it; after a few minutes, let the upper glass be removed, and the moistened spot be gently dried. The whitish film which is left may consist merely of sulphur; when hydrocyanic acid is present, it consists of sulphocyanate of ammonia. Let this residue be treated with a drop of a weak solution of perchloride of iron, when, if hydrocyanic acid was present, a blood-red tint is developed, which disappears on the addition of one or two drops of a solution of corrosive sublimate. This is known as Liebig's test.

2. *Its Medicinal Uses*.—We are indebted to the Italians for the introduction of hydrocyanic acid in the materia medica; and it was first employed at the beginning of the present century. There are no cases in which it is so serviceable as in those affections of the stomach in which pain is a leading symptom, as in gastrodynia, water-brash, and in cases of intense vomiting. Hence it is often useful in English cholera, when opium has completely failed. In pulmonary diseases, it does not produce the good effects that were formerly ascribed to it; but it is sometimes useful in allaying spasmodic cough. It has been employed with advantage in chronic skin-diseases, to allay pain and irritation. A mixture of two drachms of the dilute acid (of 2 per cent. strength) with half a pint of rose-water, and half an ounce of rectified spirit, forms a good lotion. When given internally, the average dose is from 3 to 5 minims of the 2 per cent. dilute acid, three or four times a day; it must be administered in some milk vehicle, such as simple water, or orange-flower water.

3. *As a Poison*.—Hydrocyanic acid is one of our

most energetic poisons, and is frequently employed both in murder and suicide. When a *small* poisonous dose (about half a drachm of the 2 per cent. acid) has been taken, the first symptoms are, weight and pain in the head, with confusion of thought, giddiness, nausea (and sometimes vomiting), a quick pulse, and loss of muscular power. If death result, this is preceded by tetanic spasms and involuntary evacuations. When a *large* dose has been taken (as from half an ounce to an ounce of the 2 per cent. acid), the symptoms may commence instantaneously, and it is seldom that their appearance is delayed beyond one or two minutes. 'When,' says Dr A. S. Taylor, 'the patient has been seen at this period, he has been perfectly insensible, the eyes fixed and glistening, the pupils dilated and unaffected by light, the limbs flaccid, the skin cold and covered with a clammy perspiration; there is convulsive respiration at long intervals, and the patient appears dead in the intermediate time; the pulse is imperceptible, and the respiration is slow, deep, gasping, and sometimes heaving or sobbing.' The patient survives for a longer or shorter period, according to the dose. According to Dr Lonsdale, death has occurred as early as the *second*, and as late as the *forty-fifth* minute.

The parts specifically affected are, the brain and the spinal system. The affection of the respiratory system seems to be due to the influence of the acid on those parts of the nervous system from which the respiratory organs derive their nervous power. The immediate cause of death is, in most cases, the obstruction of the respiration; but in some cases, the stoppage of the heart's action.

Where the fatal action is so rapid, antidotes are of comparatively little value. Chlorine, ammonia, cold affusion, and artificial respiration are the most important agents in the treatment. The first two should be used with great caution, and only by the medical practitioner. Cold affusion on the head, neck, and down the spine is a valuable remedy, and it is asserted that its efficacy is almost certain when it is employed before the convulsive stage of poisoning is over, and that it is often successful even in the stages of insensibility and paralysis. Artificial respiration (see RESPIRATION, ARTIFICIAL) should never be omitted. Dr Pereira states, that he once recovered a rabbit by this means only, after the convulsions had ceased, and the animal was apparently dead.

HYDRODYNAMICS treats of the laws of the motion of liquids; the flow of water from orifices and in pipes, canals, and rivers; its oscillations or waves; and its resistance to bodies moving through it. The term hydraulics is sometimes applied to the same subjects, from the Greek word *aulos*, a pipe. The application of water as a moving power forms the practical part of the subject.—In what follows, the illustrations are mostly taken from the case of water, but the principles established are true of liquids in general.

Efflux.—If three apertures, D, C, E, are made at different heights in the side of a vessel (fig. 1) filled with water, the liquid will pour out with greater impetuosity from C than from D, and from E than from C. The velocity does not increase in the simple ratio of the depth. The exact law of dependence is known as the theorem of Torricelli; the demonstration is too abstruse for introduction here, but the law itself is as follows: 'Particles of fluid, on issuing from an aperture, possess the same degree of velocity as if they had fallen freely, in vacuo, from a height equal to the distance of the surface of the fluid above the centre of the aperture.' The jet from C, for instance, has the same velocity as if the particles composing it had fallen in vacuo from

the level of the liquid to C. Now, the velocity acquired by a body in falling is as the time of the fall; but the space fallen through being as the

Fig. 1.

square of the time, it follows that the velocity acquired is as the square root of the space fallen through. In the first second, a body falls 16 feet, and acquires a velocity of 32 feet. If E, then, is 16 feet below the level, a jet from E flows at the rate of 32 feet; and if D is at a depth of 4 feet, the velocity of the jet at D will be half the velocity of that at E, or 16 feet. In general, to find the velocity for any given height, multiply the height by 2×32 , and extract the square root of the product. This rule may be expressed by the formula $v = \sqrt{2gh}$, in which v signifies the velocity of the issue, g the velocity given by gravity in a second, or 32 feet, and h the height of the water in the reservoir above the orifice. This last quantity is technically called the *head* or *charge*.

That this theory of the efflux of liquids is correct, may be proved by experiment. Let the vessel, MB (fig. 1), have an orifice situated as at o ; the water ought to issue with the velocity that a body would acquire in falling from M to the level of o . Now, it is established in the doctrine of Projectiles (q. v.), that when a body is projected vertically upwards with a certain velocity, it ascends to the same height from which it would require to fall in order to acquire that velocity. If the theory, then, is correct, the jet ought to rise to the level of the water in the vessel at M. It is found in reality to fall short of this; but not more than can be accounted for by friction, the resistance of the air, and the water that rests on the top in endeavouring to descend. When the jet receives a very slight inclination, so that the returning water falls down by the side of the ascending, ten inches of head of water may be made to give a jet of nine inches. A stream of water spouting out horizontally, or in any oblique direction, obeys the laws of projectiles, and moves in a parabola; and the range of the jet for any given velocity and angle of direction may be calculated precisely as in projectiles. The range of horizontal jets is readily determined by practical geometry. On AB describe a semicircle; from D, the orifice of the jet, draw DF perpendicular to AB, and make BK equal to twice DF; then it can be proved by the laws of falling bodies and the properties of the circle, that the jet must meet BL in the point K. If BE is equal to AD, the perpendicular EH is equal to DF; and therefore a jet from E will have the same range as that from D. Of all the perpendiculars, CG, drawn from the middle point C, is the greatest; therefore, the jet from C has the longest possible range.

The area of the orifice and the velocity of the flow being known, it is easy to calculate the quantity of water discharged in a given time. Thus, suppose the area to be 1 square inch, and the velocity 20

feet a second, it is evident that there issues in a second a cylinder or a prism of water 1 square inch in section and 20 feet long, the content of which is $1 \times 240 = 240$ cubic inches. In any given time, then, as three minutes ($= 180$ seconds), the discharge is $240 \times 180 = 43,200$ cubic inches.

It has as yet been assumed that the water in the vessel or reservoir is kept constantly at the same height, and that thus the velocity is constant. We have now to consider the case of a vessel allowed to empty itself through an orifice at the bottom. As the surface of the water sinks, the velocity of the discharge diminishes or is retarded; and when the vessel is of the same area from top to bottom, it can be proved that the velocity is *uniformly* retarded. Its motion follows the same law as that of a body projected vertically upwards. Now, when a motion uniformly retarded comes to an end, the space described is just half what the body would have passed over, had it gone on uniformly with the velocity it had at the outset. Therefore, when the vessel has emptied itself in the way supposed, the quantity discharged is half what would have been discharged had the velocity been uniform from the beginning.

The 'Contraction of the Vein.'—When, by means of the area of the opening and the velocity thus determined, we calculate the number of cubic feet or of gallons that *ought* to flow out in a given time, and then measure the quantity that actually does flow, we find that the actual flow falls short of the theoretical by at least a third. In fact, it is only the central part of the jet, which approaches the opening directly, that has the velocity above stated. The outer particles approach from all sides, with less velocity; they jostle one another, as it were, and thus the flow is retarded. In consequence of this want of uniformity in velocity and direction among the component layers of the jet, as they enter the orifice, there takes place what is called a 'contraction of the vein' (*vena contracta*); that is, the jet, after leaving the orifice, tapers, and becomes narrower. The greatest contraction is at a distance from the orifice equal to half its diameter; and there the section of the stream is about two-thirds the area of the opening. It is, in fact, the section of the contracted vein that is to be taken as the real area of the orifice, in calculating by the theory the quantity of water discharged. If the wall of the vessel has considerable thickness, and the orifice is made to widen gradually inwards, in the proportions of the contracted vein, the stream does not suffer contraction, and the area of the orifice where it is narrowest may be taken as the actual area of discharge.

Adjutages.—It has as yet been supposed that the issue is by means of a simple opening or hole in the side or bottom of the vessel; but if the flow takes place through a short tube, the rate of discharge is remarkably affected. Through a simple opening, in a thin plate, the actual discharge is only about 64 per cent. of the theoretical; through a cylindrical conducting-tube, or *adjutage*, as it is called, of like diameter, and whose length is four times its diameter, the discharge is 84 per cent. The effect is still greater if the discharge-tube is made conical both ways, first contracting like the contracted vein, and then widening. The effect of a conducting-tube in increasing the discharge is accounted for by the adhesion of the water to its sides, which widens out the column to a greater area than it would naturally have. It has thus a tendency to form a vacuum in the tube, which acts like suction on the water in the reservoir, and increases the quantity discharged. The flow is more free if the orifice is in the bottom of the

vessel, than in the side on a level with the bottom. If the discharge-tube is made to project inwards beyond the thickness of the walls of the vessel, the velocity is much impeded, owing to the opposing currents produced by the water approaching the opening.

Pipes.—When a conduit pipe is of any considerable length, the water issues from it at a velocity less than that due to the head of water in the reservoir, owing to the resistance of friction. With a pipe, for instance, of $1\frac{1}{2}$ inch in diameter, and 30 feet long, the discharge is only one half what it would be from a simple orifice of the same diameter. The rate of reduction depends upon the diameter of the tube, its length, the bendings it undergoes, &c. The resistance to the flow of water in pipes does not arise properly from friction, as understood of solids, but from the adhesion of the water to the sides of the pipe, and from the cohesion of the watery particles among themselves; it makes little difference, therefore, whether an earthenware pipe, for instance, be glazed or not. Large projections form an obstacle; but mere roughness of surface is filled up by an adhering film of water, which is as good as a glaze. The resistance increases greatly with the narrowness of the pipes. Engineers have formulas, deduced in great part from experiment, for calculating the discharge through pipes of given length and diameter, and with a given head; but the subject is too complicated for introduction here. If water flowed in a conduit pipe without friction or other obstruction, so that its velocity were always equal to that due to the head of water, there would be no lateral or bursting pressure on the walls of the pipe; and if the pipe were pierced, the water would not squirt out. Accordingly, with a short tube or adjutage, which, instead of obstructing, increases the flow, there is not only no lateral outward pressure on the walls of the tube, but there is actually a pressure inwards. If a hole is made in the wall of a cylindrical adjutage, A (fig. 2), and

Fig. 2.

the one end of a small bent tube, *bc*, is inserted in the hole, while its other end is dipped in a vessel of water, *V*, the water will be sucked up the tube, shewing the tendency that the adjutage has to form a vacuum. But when the velocity of discharge is diminished by the friction of a long pipe, or by any narrowing, bending, or other obstruction in the pipe, then that portion of the pressure of the head of water that is not carried off in the discharge, becomes a bursting pressure on the walls of the pipe. This pressure is unequal at different parts of the pipe. At the end *e*, where the water issues free and unobstructed, it is next to nothing, and gradually increases towards the reservoir at *d*, where it is equal to the difference between the head of water in the cistern, and the head due to the velocity with which the water is actually flowing in the pipe. The principle now explained accounts for the fact, that pipes often burst or begin to leak on the motion of the water in them being checked or stopped.

Resistance of Water to Bodies moving through

it.—This is greatly affected by the shape of the body, which ought to have all its surfaces oblique to the direction of the motion. When a cylinder terminates in front in a hemisphere, the resistance is only one-half what it is when the cylinder terminates in a plane surface at right angles to the axis; and if instead of a hemisphere, the termination is an equilateral cone, the resistance is only one-fourth. If a globe is cut in halves, and a cylinder, whose length and the diameter of whose base are each equal to the diameter of the globe, is fixed between them; this cylinder with hemispherical ends experiences less resistance than the globe alone, the diminution being about one-fifth of the resistance to the globe. Also the resistance increases in a higher ratio than the simple one of the velocity. One part of the resistance arises from the momentum that the body has to give to the water it displaces. Moving at a certain rate, it displaces a certain quantity; moving at twice that rate, it displaces twice the quantity in the same time. But not only does it displace twice the number of particles of water; it also has to displace them with twice the velocity; the pressure of the resistance is thus not merely doubled, but quadrupled or squared. Similarly, when the velocity is tripled, the resistance arising from the simple displacement of water becomes nine times as great. Another part of the resistance of liquids to bodies moving in them is owing to the cohesion of the particles, which have not to be thrown aside merely as separate grains, but to be torn asunder. In addition to this, when the velocity is considerable, the water becomes heaped up in front, and depressed at the other end from not having time to close in behind, thus causing an excess of hydrostatic pressure against the direction of the motion. Owing to the combination of these causes, the real law of the increase of resistance is difficult to investigate, and the results of experiments are not a little discordant. See WATER-POWER, WAVES.

HYDRO-FLUORIC ACID. See FLUORINE.

HYDROGEN (symbol H, equiv. 1), so called from the Greek words *hydōr*, water, and *gennōo*, to generate, is an elementary substance, which exists in the form of a permanent, colourless, and inodorous gas. One of its most striking peculiarities is its specific gravity, it being the lightest of all known bodies. Assuming the weight of a given volume of atmospheric air to be 1, the weight of the same volume of hydrogen under similar conditions is 0.0692; hence hydrogen is $1\frac{1}{2}$ times lighter than atmospheric air; while, on the other hand, it is 241.573 times lighter than platinum, the heaviest body known. Its refractive power is greater than that of any other gas, and is more than 6 times as great as that of atmospheric air. It is combustible; that is to say, it is capable of combining with oxygen, and developing light and heat. When a lighted taper is passed up into an inverted jar of hydrogen, the gas burns quietly with a pale-blue, scarcely visible flame, and the taper is extinguished. The flame only occurs at the line of junction of the hydrogen and the external air. If the hydrogen be mixed with air or oxygen prior to the application of the taper, the whole mixture is simultaneously inflamed, and there is a loud explosion, which is most violent when 2 volumes of hydrogen are mixed with 1 volume of oxygen, or with 5 volumes of atmospheric air. The hydrogen and oxygen in these cases combine to form watery vapour or steam, which suddenly expands from the high temperature attendant on the combustion, but immediately afterwards becomes condensed; this condensation causes a partial vacuum, into which

the surrounding air rushes, and by the collision of its particles, produces the report. At ordinary temperatures, water dissolves rather less than 2 per cent. of its volume of hydrogen. It is one of the few gases which has never yet been liquefied. Pure hydrogen, though it cannot support life, is not poisonous, and when mixed with a sufficient quantity of atmospheric air or oxygen, may be breathed for some time without inconvenience.

Hydrogen does not possess very marked chemical properties. The only substances with which it combines directly at ordinary temperatures are chlorine and oxygen. Hydrogen and chlorine, mixed together, and exposed to direct sunlight, combine with explosion; in diffused daylight, they gradually unite; but in the dark do not act on one another. Hydrogen and oxygen do not combine spontaneously even in direct sunlight, but require the presence of a red-hot solid, of flame, or of spongy platinum.

It is generally stated that hydrogen does not exist naturally in a pure or uncombined state, but Bunsen recognised its presence in variable proportions in the gases evolved from the solfataras of Iceland, and it will probably be detected in other localities where similar geological relations hold good. In combination with oxygen, as water, it not only forms a very considerable part of the earth, and of the atmosphere, but enters largely into the structure of every animal and vegetable organism. It is an essential ingredient of many inflammable minerals, such as coal, amber, and petroleum; and of certain gases, such as marsh gas, ammonia, and hydrosulphuric acid (or sulphuretted hydrogen). It likewise enters into the composition of a large number of manufactured substances and products used in the arts, medicine, &c., as for instance, sal-ammoniac, starch, sugar, vinegar, alcohol, olefiant gas, aniline, indigo, morphia, strychnia, hydrocyanic acid, &c.

There are numerous ways in which hydrogen may be prepared, but the usual and most convenient process is by the action of diluted sulphuric acid on zinc. About half an ounce of granulated zinc is placed in a retort, and a dilute acid, prepared by gradually mixing an ounce of oil of vitriol with six ounces of cold water, is poured on the zinc. Hydrogen gas is rapidly evolved in great abundance, but the first portions should not be collected, since they are mixed with the atmospheric air which was contained in the retort. The rest of the gas may be collected in the ordinary way over water. In this process the zinc takes oxygen from the water, and forms oxide of zinc, which combines with the sulphuric acid, forming sulphate of zinc, which remains in solution, while the hydrogen of the decomposed water escapes. The reaction is shewn in the formula, $\text{Zn} + \text{H}_2\text{SO}_4 = \text{ZnO} \cdot \text{SO}_3 + \text{H}$. A precisely similar reaction ensues if we use iron in place of zinc, but in this case the gas is generally less pure.

Hydrogen gas, under the name of combustible air, was obtained in the 16th c. by Paracelsus by treating certain metals with dilute acids, and was more or less known to Boyle and others; but Cavendish, in his paper on 'Factitious Airs,' published in the *Transactions of the Royal Society* for 1766, was the first to describe accurately the properties of this gas, and the methods of obtaining it; hence he is usually mentioned as its discoverer.

HYDROGEN, BINOXIDE OF (symb. HO_2 , equiv. 17), is a colourless liquid of a syrupy consistence, with a specific gravity of 1.45 (water being 1), and a peculiar odour, something like that of very dilute chlorine. It bleaches vegetable colours, and when applied to the tongue or the skin, produces a white spot, and excites considerable pain. From the readiness with which it gives off its oxygen, it is a powerful oxidising agent. The method of

preparing it is complicated and difficult. This substance was discovered in 1818 by Thenard, who termed it oxidised water. Dr B. W. Richardson, an eminent London physician, has lately examined its value (in solution) as a therapeutic agent, and has found it to be of extreme use in whooping-cough, in certain forms of rheumatism, and (as a palliative) in the last stages of consumption.

HYDROGRAPHY (Gr. *hydōr*, water, *graphō*, to write) is a description of the surface waters of the earth, particularly of the bearings of coasts, of currents, soundings, islands, shoals, &c., and of anything the knowledge of which may be useful for purposes of navigation. It, consequently, includes the construction of charts, maps, &c., in which these particulars are detailed. It is, in fact, to the sea what geography is to the land. The first step in the erection of hydrography into a science, was made in the 15th c. by Henry the Navigator, who was the first to construct a sea-chart worthy of the name. Among the maritime nations of Europe, it is now made a matter of prime concern; the hydrographic office being an important branch of the naval administration. The head of the hydrographic department in the British service is usually a captain in the royal navy. The officers surveying in different parts of the world send their observations, soundings, &c.; and it is the business of the hydrographer to consolidate these into available maps. The hydrographer receives £800 a year in addition to his half-pay. In proof of the value attached to these Admiralty charts among the marine of England and even of foreign nations, it may be mentioned that in 1859, no less than 68,270 charts, besides 6918 books of sailing directions, were sold.

HYDROMANCY. See DIVINATION.

HYDROMANIA. See PELLAGRA and SUICIDE.

HYDROMETER. See AREOMETER.

HYDROMYS, a genus of rodent quadrupeds, of the family *Muridae*, of which there are only two known species, very similar to one another, natives of Van Diemen's Land. They have two incisors and four molars in each jaw. They are called BEAVER RATS in Van Diemen's Land; are nocturnal and very shy; inhabit the banks both of fresh and salt water, and swim well. The largest species is twice the size of a common rat. One of them has the belly white, the other yellow.

HYDROPATHY, or **HYGIENIC MEDICINE**, popularly termed the **WATER CURE**. Under the head of Baths and Bathing (q. v.), an account has been given of the bath in general, as a means of preserving health. We have here to speak of water in its manifold uses as an engine in the cure of disease, and as forming a principal element in that combination of hygienic appliances which goes to make up hydrotherapy as at present practised. (In accordance with the plan followed in other cases of the kind, the view exhibited is that of an adherent of the system.)

The efficacy of water, in the cure of numerous forms of disease, has long been recognised. Water was largely employed by Hippocrates, the 'Father of Medicine,' more than 2300 years ago, in the treatment of many kinds of disease; and along with a regulated diet, and an implicit belief in the *vis medicatrix nature*, it appears to have formed the chief element in his medical armoury. Horace has enshrined the memory of Antonius Musa, the hydro-pathic physician of the Emperor Augustus (Épist. i. 15). Both Celsus and Galen—who flourished, the one about 50 years B.C., and the other in the 2d c.—speak favourably in their writings of the use of water in the cure of disease, regarding it as

of high value in the treatment of acute complaints, particularly of fevers. Throughout the Middle Ages, likewise, many physicians of name, including Aetius and Paulus Ægineta, and the more celebrated Paracelsus, were advocates of the remedial virtues of water; all of them, however, having faith in its uses in the treatment rather of acute than of chronic disorders. In 1723, Nicolo Lanzani, a Neapolitan physician, published a learned treatise on the subject. In our own country, about the beginning of the 18th c., Sir John Floyer and Dr Baynard made a large use of water. Their conjoint work, denominated *Psychrolousia*, or the 'History of Cold Bathing, both Ancient and Modern,' is replete with quaint learning and practical shrewdness and sagacity. But the most able and scientific among the older treatises that have appeared in England on the subject of the water treatment, is the work of the well-known Dr Currie (q. v.), the biographer of the poet Burns, published in 1797, and entitled *Medical Reports on the Effects of Water, Cold and Warm*, &c. In this work, Dr Currie recommends the cold affusion in typhus and other fevers, and gives practical directions in regard to the cases and the times when it may be used with advantage. Eminent physicians of the present day have admitted that these views, so far as they went, were as scientific in principle as they were novel in their application; but the practice founded on them was considered too dangerous by Currie's contemporaries, and fell into speedy neglect. It is worthy of remark, that Currie appears to have limited his use of water to acute ailments exclusively.

We have thus seen that up to the beginning of the present century, by some of those who employed it as a curative agent, water was used in the treatment of acute, and by others of chronic diseases; by some as an internal agent alone, by others as an external application in the various forms of the bath, but never in all the manners combined. This combination was first effected by the original genius of Vincent Priessnitz, a Silesian farmer, with whom began a new era for the water-cure. It was owing, we are told, to his successful treatment of more than one bodily injury which he had sustained in his own person that, about the year 1820, Priessnitz became so fortified in his convictions as to the curative powers of water as to devote himself to employ it medically in the cure of others. Beginning with the external application of water for trifling diseases among the poor of his neighbourhood, he gradually undertook an extended range of cases, and multiplied the modes of administration, introducing the wet compress, the douche bath, partial baths of all kinds, the sweating process, the wet sheet, together with copious drinking of pure water. In addition to water in all these forms, he insisted on the value of exercise, diet, fresh air, and mental repose, in the cure of disease; thus practically calling to his aid the entire resources of hygiene, and establishing by a simple, yet thoroughly original combination, nothing less than a new system of medical treatment. As to the success which attended Priessnitz's practice, it is a historical fact that of 7500 patients, who had gone to Gräfenberg for advice and treatment, up to the year 1841, or within the space of about 20 years, there had been only 39 deaths, and some of these, according to the registry of the Austrian police, 'had died before commencing the treatment, while some others were reported in a forlorn state before anything was attempted.' It is to be regretted, however, that the founder of the new system was not himself an educated physician, so that he could have understood better the philosophy of his own practice, and explained it more correctly. He would not have called his system the

'Water-cure,' a name scientifically one-sided and incomplete, and therefore misleading. It is equally to be regretted that many of the immediate followers of Priessnitz, while destitute of his remarkable sagacity and genius, should have been no better furnished than himself with a scientific knowledge of disease and general professional culture.

In spite of all drawbacks, however, the undoubted merits of hydrotherapy at length called to its defence many men of standing in the profession, who, allowing for some of its early extravagances, stepped forth to explain it scientifically, and pressed it on the acceptance of their brethren; and from their advocacy has sprung up in England a school of hydropathic physicians, the philosophy of whose plan of treatment we shall now briefly describe.

Physiology teaches us, that the various organs of our bodies cannot be kept in a healthy state without the observance of certain regulations called the primary 'Laws of Health.' When these are broken, the result to the offender is disease in one of its many forms. Until the appearance of hydrotherapy, physicians attempted to correct the evil thus caused—and the great majority do so still—by the administration of one or other of the drugs which go to form the medical repertory known as the pharmacopœia; and the argument on which this practice has been based is the very simple one, that experience has proved the medicine or medicines to be efficacious in a large proportion of similar cases. Hydrotherapy proceeds according to a very different method. Taking as his central maxim the principle first propounded by Hippocrates, that it is nature's own strivings after health (*vis medicatrix nature*) that really cure the patient when he is cured, the function of art being mainly to remove obstacles, the hydropathic physician avoids using all means with whose effects he is not thoroughly conversant, or which may, at least, interfere with nature's own operations. Hence, as a rule, he eschews the use of drugs, and betakes himself to those more simple natural agents which, in their totality, receive the name of hygiene. The conditions of health, as unfolded by physiology, may be briefly stated to consist of five necessary requirements—air, exercise, water, diet, and nervous repose. These are undeniably essential to the preservation of health; no human being can possibly continue in a fair state of health when deprived of the just proportion of any one of them. This proposition, which may be regarded as axiomatic, forms the starting-point of hydrotherapy in the cure of disease. Admitted that certain agencies are necessary to the preservation of health, the hydropathic principle is simply this, that the very same agencies, infinitely modified of course according to the requirements of each particular case, and generally much intensified, are not only the safest, but by far the surest means of curing chronic disease; or, to put it more correctly, are the best means which can be brought to nature's assistance for enabling her to effect a cure herself.

Here it is proper to explain what is meant by saying that the natural agents of health are *intensified* when they are used, not for the preservation of health, but the cure of disease; or, in other words, when we pass from natural hygienics to natural therapeutics. Take the element of exercise, for instance, one of the most powerful hydropathic agencies. Every one knows, although but few act systematically on the knowledge, that a certain amount of exercise is necessary to maintain the body in health; the hydropathic doctrine, accordingly, is, that in the cure of chronic disease, this exercise must be intensified—increased to the full extent which the patient's strength will warrant. So, again, as to the use of water: a certain amount

of pure water, used externally and internally, is also necessary to the maintenance of health; hydrotherapeutically, a much more liberal use of the same element in both ways is necessary to the cure of disease. The reader's special attention is called to this, which in fact is the very kernel of the hydrotherapeutic theory.

Let us now explain more in detail how and in what cases hydrotherapy employs the agents on which it relies. Diseases may, for general purposes, be divided into two great classes: those in which the physician is called on to lower or *reduce* to the standard of health; and those in which the object of his endeavours is, on the other hand, to assist in *elevating* to the same standard. In the former category, range themselves all those diseases which are marked by a plethoric or inflammatory type—by an overplus of mal-directed strength in the economy; in the latter, those distinguished by a corresponding diminution in the vital powers. It may be truly affirmed, that to rectify both these abnormalities, and to restore the equilibrium of health, is the great object of medical treatment. The ordinary practice seeks to achieve this object mainly, in both instances, by means of drugs, respectively adapted to the two classes, and tending to lower in the one case and to exalt in the other. The hydropathic practice, with the same object in view, employs, as already stated, the natural remedies—air, exercise, water, diet, and repose.

Thus, in dealing with acute and plethoric complaints, and the whole order of diseases ranging themselves under the former of the divisions just indicated, water is the element which enacts by far the most conspicuous part, and the application of it most serviceable in these cases is the *wet sheet* or *pack*. Indeed, the discovery by Priessnitz of this application of water was perhaps the most important contribution which he made to the new system of which he was the practical founder, inasmuch as it at once supplied one of the most powerful and at the same time one of the safest methods of combating almost every form of acute disease. This, the most distinctive of hydropathic appliances, may be thus described: Over the mattress of a bed or sofa is extended a stout blanket, and on this is spread a linen sheet, well wrung out of cold water, so that it is only damp. On this the patient is laid, and immediately enveloped tightly with a heavy weight of blankets upon him, tucked in so closely as to completely exclude all air. The body's natural heat, acting on the damp linen, generates vapour almost immediately, and the patient forthwith finds himself, not in a cold, but in a comfortably warm vapour bath—in a novel, but by no means unpleasant form of body poultice. The effects of this process on the economy seem to be plain enough. It is clear, in the first place, that the pores of the skin, so numerous and performing so important a function, must thereby be thoroughly cleansed, and the blood itself depurated; with the equalisation of temperature over the entire surface of the body, will follow a corresponding equalisation in the distribution of blood throughout the system, thereby relieving internal congestions wherever occurring; and lastly, from the soothing effects on the nervous system, and the allaying of all irritation, must result not only the alleviation of pain, but that lowering of the heart's action, and with it of the circulation of the blood, of such incalculable importance in the treatment of many forms of disease, and especially of fevers. Such is the wet sheet.

Of the same order of remedy, although in many respects very different from it, is the Turkish bath, recently introduced into England, and now fairly

established throughout the country. In this bath, the hydropathic procedure has received a most important auxiliary in the treatment of many forms of disease, but in an especial manner of the kind more particularly under consideration at present, such as gout, rheumatism, bronchitis, and other complaints of an inflammatory or febrile character. The same end of diaphoresis, or sweating, is secured, although not so efficiently, by means of the vapour bath as used by the Russians, and by hot air as generated by the spirit-lamp. The latter has the advantage of being less expensive, and the bather not being required to breathe the heated air, many persons can use it who would be quite unable to respire, without faintness, the highly heated atmosphere of the Turkish bath. In addition to the above, must be mentioned the use of warm fomentations, in the form of flannels wrung out of boiling-water—a kind of application much relied on for subduing local pain proceeding from whatever cause, for relieving congestion, and abating and checking inflammation. So much for the principal hydropathic operations employed to treat acute and inflammatory diseases—processes corresponding in their aims and effects to antiphlogistic, diaphoretic, and sedative drugs.

We have now to speak of the hydropathic agents brought to bear on the second great division of maladies, wherein the object is not to lower, but to elevate, to the standard of health. In the former class of cases, it was stated that water was the agent most prominently brought forward, and it is in such diseases alone that the term 'water cure' is at all appropriate. In those we are at present dealing with, water certainly plays an important part, but it is only in its combination with good air, exercise, regulated diet, and nervous repose, that diseases are cured as they are. As an illustration: A cold bath is given in the usual way as a tonic. Its effects are admirable under certain conditions—the first and chief of these being that a good reaction takes place; that the blood, which had been driven by the constringent effects of the cold water from the surface of the body into the inner parts, should return in increased force when the stimulus of cold is withdrawn. But to this end, in all but very strong persons, exercise immediately after the bath is indispensably necessary, and must follow it as a matter of course, or the bath cannot be administered with comfort, or even with safety. As much might be said for the co-operative importance of pure air, of diet, and of nervous repose, all of them, if necessary to the preservation of health, of tenfold importance in the cure of disease. Thus the highly tonic properties of the bath, administered in its various forms, and followed by a due proportion of exercise, more especially in strong bracing air, produce at once a marvellous effect in sharpening the appetite and improving the powers of digestion, so that, if simple and nourishing diet is administered, better blood will be elaborated, and, consequently, every tissue of the body be more highly nourished and invigorated. It is scarcely necessary to say, that, in all cases, this is and must always be a gradual process, for it is evident that the treatment pursued, whether in reference to exercise, diet, or the use of the stimulus of water, must bear an accurate relation to the invalid's strength. Little by little, however, and in most cases much more rapidly than might be imagined, improvement begins to take place. From the great action brought to bear on the skin by means of the different applications of water, the prudent use of the Turkish bath, and the effects of full exercise, a rapid change of the particles of the body takes place—so rapid, that, according to Liebig, 'by means of the water-cure-

treatment, a change of matter is effected in a greater degree in six weeks, than would happen in the ordinary course of nature in three years'—while, at the same time, the effete matter thrown off is replaced by the healthier materials supplied to the economy by an improved quality of blood, itself the result of an improved digestion, and this, again, resulting from the heightened *vis vite* which the combined hydropathic agencies have produced. The forms of the bath may of course be varied *ad infinitum*, as well as its power according to the temperature of the water. The baths most in vogue in daily practice are technically denominated the *Wash down*, *Dripping sheet*, *Shallow*, *Sitz bath*, and *Douche*, together with the *Pack*, or *Wet sheet* before mentioned; in addition to which there is a catalogue of local applications, too extensive to enumerate. These various appliances of water are capable of producing extraordinary effects on the economy, constituting, as they do, especially when conjoined with exercise, the most powerful tonics, and, at the same time, the most safe and agreeable, that can be brought to bear on the body. It might truly be added that, in the treatment of chronic disease, this same element, water, is capable of becoming, according to the manner and quantity of its use, internally and externally, an alterative, derivative, diuretic, and diaphoretic. It is as a tonic and stimulant, however, that its virtues are most conspicuous, and most called into requisition for the cure of chronic ailments.

From a variety of circumstances, the system of hydropathic medicine has been greatly misunderstood and misjudged by the general public. For one thing, the name of 'water cure,' or 'hydropathy,' adopted by Priessnitz, has been very prejudicial, as leading to the false inference that the one element of water alone constitutes the bone and marrow of the system, playing the part of a panacea for every form of human ailment. Such a notion has never been maintained by the practitioners of scientific hydropathy, and it is matter of regret that some more comprehensive and catholic title, as that of 'hygienic medicine,' has not long since been adopted. As it is, the prejudice against the system is gradually giving way; it is no longer treated as heresy by the orthodox profession; and many enlightened practitioners are in the habit of sending certain classes of their patients to hydropathic establishments, and even subject themselves to the treatment. In fact, the tendency of ordinary medical practice has of late years been towards the principles on which hydropathy is based. A manifest disposition exists on the part of the more enlightened members of the profession to rely much less on art and much more on nature in the treatment of diseases of every type, but especially those of a chronic character, than was formerly the case; and as the practitioners of scientific hydropathy by no means exclude the use of drugs, when they appear to be necessary, it would seem that a convergence of opinion is really coming about.

Hydropathy, hitherto, has been almost exclusively practised in large establishments, presided over by competent medical men, and dedicated to a thorough and systematic carrying out of the principles on which the system of cure is founded. There can be no question that this is by far the most complete and satisfactory arrangement when it can be accomplished. But the power of leaving their daily work for the purpose of seeking health, is what falls to the lot of very few; and if the hydropathic treatment were to be absolutely limited to its chosen retreats in the country, and incompatible with the business and work of town-life, it would be shorn of half its utility as a remedy, and be a luxury to

which only the rich and disengaged could aspire. But exercise, morning and evening, can usually be had by most persons. The same applies to the systematic and persistent use of the bath, to the regulation of diet, and the observance of early hours. By these means, even without country air and other hygienic adjuncts, no doubt a vast deal might be done both for the cure of disease and the preservation of health. Towards effecting the latter object, at least, no one will deny the immense value of hydropathy. No one, having any practical acquaintance with it, can doubt its influence in the promotion of those habits of temperance, cleanliness, self-denial, and general obedience to the laws of health, which, while they tend so much to the happiness of the individual, go no less to secure the strength and prosperity of nations. To those who would inquire further into the subject, we may recommend the work of Dr Gully, entitled *The Water-cure in Chronic Disease*; that of Dr James Wilson, called *Principles and Practice of the Water-cure*; the several works of Dr Edward Johnson; and Dr Lane's treatise, *Hydropathy, or Hygienic Medicine*.

HYDROPHOBIA (derived from *hydōr*, water, and *phōbos*, fear) is one of the diseases that are produced by animal poisons. A person is bitten by a mad dog or other animal. The wound gradually heals in the ordinary manner. After an uncertain interval, usually ranging from six weeks to eighteen months, which is termed the period of *incubation*, the following symptoms appear: The patient experiences discomfort or pain at the seat of the bite. The cicatrix tingles, or feels stiff or numb; sometimes becomes swelled and livid, and occasionally reopens, and discharges a peculiar ichor. The morbid sensations gradually extend from the original seat of injury towards the trunk. This period is termed the stage of *recrudescence*. Within a few hours, or, at longest, a very few days after the exhibition of this local irritation, during which time the patient has a sense of general discomfort and illness, the specific constitutional symptoms begin to manifest themselves; he complains of pain and stiffness about the neck and throat, finds himself unable to swallow fluids, and every attempt to do so—often even the sight or the sound of fluids—brings on a terrible paroxysm of choking and sobbing; and this continues for two or three days, till the patient dies from pure exhaustion. The passage of a gust of wind across the face, or the waving of a mirror before the eyes, is often sufficient to excite these paroxysms. The mental condition in the last stage of this disease varies; the patient may be calm and tranquil; generally he is irritable and apprehensive, and suspicious; and in most cases, a certain degree of delirium, or even mania, is associated with the irritability. Death most commonly takes place on the second or third day after the commencement of the specific symptoms.

Some medical writers have maintained that hydrophobia may occasionally be spontaneously developed in man, as is undoubtedly the case occasionally in the lower animals (the dog and wolf, for example); but even if this ever occurs, the instances are so extremely rare as not to affect the general statement, that in man the disease is the result of an animal poison, which is most commonly communicated by the bite of the dog, but which has also been produced by the bite of the wolf, the jackal, the racoon, and the cat. The poisonous saliva is perfectly innocuous when applied to the unbroken skin; to produce its effects, there must be some abrasion of the cuticle; but according to the late Mr Youatt, it may enter the system by mere contact with mucous membranes.

The disease is said to have been caused by the

mere *scratch* of a cat; but as both cats and dogs frequently apply their paws to their mouths, the poisonous saliva may be introduced in this way by the claws.

There has been much discussion as to what becomes of the poison. Is it immediately taken into the system generally, or does it remain imprisoned in the wound or cicatrix for a time? In the latter case, we might successfully remove the poison any time between the infliction of the bite and the period of recrudescence; and that the poison is thus locally retained seems more than probable from the fact, that at this period morbid phenomena of various kinds exhibit themselves at the seat of the wound, and that these phenomena are speedily followed by the characteristic symptoms of the disease.

Little need be said of the treatment of hydrophobia, for there is no well-authenticated case of recovery on record. The most distressing symptoms may, however, be alleviated by chloroform, opiates, the hot-air bath, &c. But although the disease cannot be cured, its development may be prevented by the early and complete excision of the bitten part, provided the situation of the bite allows of the free use of the knife. 'If,' says Dr Watson, 'the injury be so deep or extensive, or so situated that you cannot remove the whole surface of the wound, cut away what you can; then wash the wound thoroughly and for some hours together, by means of a stream of warm water, which may be poured from a tea-kettle; place an exhausted cupping-glass from time to time over the exposed wound; and finally apply to every point of it a pencil of lunar caustic. If you cannot bring the solid caustic into contact with every part, you had better make use of some liquid escharotic; strong nitric acid, for example.' Early excision is the only sure preventive, but if, for any reason, the operation has been omitted in the first instance, it is advisable for the reasons already given regarding the probable latency of the poison, to cut out the wound at any period before symptoms of recrudescence appear. The reason why many neglect to have immediate recourse to excision probably is, that hydrophobia by no means follows, as a matter of certainty, the bite of a rabid animal. John Hunter states that he knew an instance in which, of twenty-one persons bitten by a mad dog, one alone was infected. On the other hand, we have evidence that of one hundred and fourteen persons who were bitten by rabid wolves, sixty-seven, or more than one-half, were victims to this disease. Although we have no very trustworthy evidence on a large scale, there is no doubt that the majority of persons who are bitten by a mad dog do escape the disease, even without taking any precaution. In many of these cases, the virus is probably removed by the teeth passing through the clothes.

The nature of the disease in the dog or other animal whose bite causes hydrophobia, is considered under **RABIES**.

HYDROPHYLLACEÆ, a natural order of exogenous plants, containing about 80 known species, natives chiefly of the colder parts of America. None of them are of importance for any use to which they are applied, although *Hydrophyllum Canadense* has been reputed in North America a remedy for snake bites, and the leaves of *H. Virginicum*, or Shawanese Salad, are eaten by the Indians, both raw and boiled; but some of them are favourite ornaments of our flower-borders, particularly different species of *Nemophila*. The order includes some small trees and bushes as well as herbaceous plants. They are often hispid, like the *Boraginaceæ*.

HYDROSTATICS treats of the equilibrium of liquids, and of their pressures on the walls of vessels containing them; the science depends on the way in which the molecules of a liquid form a mass under the action of gravity and molecular attraction, the latter of which is so modified in liquids as to give them their state of liquidity. While the particles of a liquid cohere, they are free to slide upon one another without the least apparent friction; and it is this perfect mobility that gives them the mechanical properties considered in hydrostatics.

The fundamental property may be thus stated: WHEN A PRESSURE IS EXERTED ON ANY PART OF THE SURFACE OF A LIQUID, THAT PRESSURE IS TRANSMITTED UNDIMINISHED TO ALL PARTS OF THE MASS, AND IN ALL DIRECTIONS. Most of the other propositions of hydrostatics are only different forms or direct consequences of this truth. This is a physical axiom, but its truth may be experimentally proved. Suppose a close box B filled with water, and having a tube *a* inserted into the upper cover, of an inch in area, and with a plug or piston fitting into it. If

Fig. 1.

the piston *a* is now pressed down upon the water with a force equal to a poundweight, the water, being unable to escape, will react upon the piston with the same force; but it obviously will not press more against *a* than against any other part of the box, therefore every square inch of the interior surface of the box is pressed outward with the force of a pound. If, then, there is another tube inserted in any part of the box with a plug of the same area, as at *b*, it will require a force of a pound to keep this plug in its place. (We leave out of account at present the pressure upon *b* arising from the weight of the water in the box above it, and consider only the pressure propagated by the forcing down of the plug *a*.) However many plugs of the same size there were, each would be pressed out with the same force of a pound; and if there were a large plug of four times the area, as at *c*, it would be pressed out with a force of four pounds. We have only, then, to enlarge the area of the piston *c* to obtain any multiplication of the force exerted at *a*. If the area of *c* is 1000 inches, that of *a* being one inch, a pressure of one pound on *a* becomes a pressure of 1000 pounds on *c*; and if we make the pressure on *a* one ton, that on *c* will be 1000 tons.

This seemingly wonderful multiplication of power has received the name of the *hydrostatic paradox*. It is, however, nothing more than what takes place in the lever, when one pound on the long arm is made to balance 100 pounds on the short arm.

If the pressure we have supposed exerted on the piston *a* arose from a pound of water poured into the tube above it, it would continue the same though the piston were removed. The pound of water in the tube is then pressing with its whole weight on every square inch of the inner surface of the box—

Fig. 2.

downwards, sidewise, and upwards. The apparatus called the *hydrostatic bellows* acts on this principle (see fig. 2). It consists of two stout circular boards

connected together by leather in the manner of a bellows, B. The tube A is connected with the interior; and a person standing on the upper board, and pouring water into the tube, may lift himself up. If the area of the upper board is 1000 times that of the tube, an ounce of water in the tube will support 1000 ounces at W. It is on the same principle that the Hydraulic Press (q. v.) depends.

1. *Equilibrium of Liquids*.—After this explanation of the fundamental properties of liquids, it may be enough to state the two conditions of fluid equilibrium which directly flow from it. (1.) Every molecule of the liquid must be solicited by equal and contrary pressures in every direction. This is a corollary from liquid mobility. (2.) The upper molecules of a liquid, which are free, must form a surface perpendicular to the impressed force. The truth of this will sufficiently appear from the proof, that the surface of a liquid at rest under gravity must be what is called horizontal. It can be shewn to be a consequence of the primary property of 'pressing equally in all directions.' For let *da* and *cb* be vertical lines, or lines in the direction of gravity; and *ab* a plane at right angles to that direction, or horizontal. A particle of the liquid at *a* is pressed by the column of particles above it from *a* to *d*; and the like is the case at *b*. Now, since the liquid is at rest, these pressures must be equal; for if the pressure at *b*, for instance, were greater than at *a*, there would be a flow of the water from *a* towards *b*. It follows that the line *ad* is equal to *bc*, and hence that *dc* is parallel to *ab*, and therefore horizontal. The same might be proved of any two points in the surface; therefore the whole is in the same horizontal plane.

Fig. 3.

2. *Pressure of Liquids on Surfaces*.—The general proposition on this point may be stated thus: The pressure of a liquid on any surface immersed in it, is equal to the weight of a column of the liquid whose base is the surface pressed, and whose height is the perpendicular depth of the centre of gravity of the surface below the surface of the liquid. See article CENTRE OF PRESSURE. The pressure thus exerted is independent of the shape or size of the vessel or cavity containing the liquid.

3. *Buoyancy and Flotation*.—As a consequence of the proposition regarding the pressure of liquids on surfaces, it can be shewn that when a solid body is immersed in a liquid, it loses as much weight as that of an equal bulk of the liquid weighs. It follows that, if a cubic foot of the liquid and of the solid have equal weights, the solid will lose all its weight, or will remain in the liquid wherever it is put; if a cubic foot of the liquid weigh more than one of the solid, the solid will not only lose all its weight, but will rise up, and that with a force equal to the difference; if a cubic foot of the liquid weigh less than one of the solid, the solid will lose weight, but will sink.

When a solid swims, or rises and floats on the surface of a liquid, the next problem of hydrostatics is to determine how much of it will be below the surface. We have already seen that any solid in a liquid is pressed upward with a force equal to the weight of the water whose room it occupies. Now, a floating body must be pressed up with a

Fig. 4.

force equal to its own weight, otherwise it would sink lower; hence, *a floating body displaces its own weight of the liquid*. A solid, as AB in fig. 4, sinks until the space occupied by the part B immersed would contain an amount of water equal in weight to the whole solid AB.

As the buoyancy of a body thus depends on the relation between its weight and the weight of an equal bulk of the liquid, the same body will be more or less buoyant, according to the density of the liquid, in which it is immersed. A piece of wood that sinks a foot in water, will sink barely an inch in mercury. Mercury buoys up even iron. Also a body which would sink of itself, is buoyed up by attaching to it a lighter body; the bulk is thus increased without proportionally increasing the weight. This is the principle of life-preservers of all kinds. The heaviest substances may be made to float by shaping them so as to make them displace more than their own weight of water. A flat plate of iron sinks; the same plate, made concave like a cup or boat, floats. It may be noted that the buoyant property of liquids is independent of their depth or expanse, if there be only enough to surround the object. A few pounds of water might be made to bear up a body of a ton weight; a ship floats as high in a small dock as in the ocean.

4. *Stability of Floating Bodies*.—Conceive *abd* (fig. 5) to be a portion of a liquid turned solid,

Fig. 5.

but unchanged in bulk; it will evidently remain at rest, as if it were still liquid. Its weight may be represented by the force *cg*, acting on its centre of gravity *c*; but that force is balanced by the upward pressure of the water on the different parts of the under surface; therefore, the resultant of all these elementary pressures must be a force, *cs*, exactly equal and opposite to *cg*, and acting on the same point *c*, for if it acted on any other point, the body would not be at rest. Now, whatever other body of the same size and shape we suppose substituted for the mass of solid water *abd*, the supporting pressure or buoyancy of the water around it must be the same; hence we conclude, that *when a body is immersed in a liquid, the buoyant pressure is a force equal to the weight of the liquid displaced, and having its point of application in the centre of gravity of the space from which the liquid is displaced*. This point may be called the *centre of buoyancy*.

We may suppose that the space *abd* is occupied by the immersed part of a floating body *aebd* (fig. 5).

The supporting force, *cb*, is still the same as in the former case, and acts at *c*, the centre of gravity of the displaced water; the weight of the body must also be the same; but its point of application is now *c'*, the centre of gravity of the whole body. When the body is floating at rest or in a state of equilibrium, this point must evidently be in the same vertical line with *c*; for if the two forces were in the position of *cs*, *c'g* (fig. 6), they would tend to make the body roll over. The line passing through

the centre of gravity of a floating body and the centre of gravity of the displaced water, is called the *axis of flotation*.

The equilibrium of a floating body is said to be *stable*, when, on suffering a slight displacement, it tends to regain its original position. The conditions of stability will be understood from the accompanying figures. Fig. 7 represents a body floating

Fig. 7.

Fig. 8.

in equilibrium, *G* being its centre of gravity, *B* its centre of buoyancy, and *AGB* the axis of flotation, which is of course vertical. In fig. 8 the same body is represented as pushed or drawn slightly from the perpendicular. The shape of the immersed portion being now altered, the centre of buoyancy is no longer in the axis of figure, but to one side, as at *B*. Now, it is evident, that if the line of direction of the upward pressure—that is, a vertical line through *B*—meets the axis above the centre of gravity, as at *M*, the tendency of the two forces is to bring the axis into its original position, and in that case, the equilibrium of the body is stable. But if *BM* meet the axis below *G*, the tendency is to bring the axis further and further from the vertical, until the body get into some new position of equilibrium. There is still another case; the line of support or buoyancy may meet the axis in *G*, and then the two forces counteract one another, and the body remains in any position in which it is put; this is called *indifferent equilibrium*. In a floating cylinder of wood, for instance, *B* is always right under *G*, in whatever way the cylinder is turned. When the angles through which a floating body is made to roll are small, the point *M* is nearly constant. It is called the *metacentre*; and its position may be calculated for a body of given weight and dimensions. In the construction and lading of ships, it is an object to have the centre of gravity as low as possible, in order that it may be always below the metacentre. With this view, heavy materials, in the shape of ballast, are placed in the bottom, and the heaviest portions of the cargo are stowed low in the hold. See SPECIFIC GRAVITY AND AREOMETER.

HYDROSULPHURIC ACID (HS), known also as *Sulphuretted Hydrogen*, *Sulphydric Acid*, and *Hydrothionic Acid*, is a natural gaseous constituent of many mineral waters, as, for example, those of Aix-la-Chapelle in Germany, Barèges in France, Abano in Italy, and Harrogate in England, and is evolved from fumaroles and volcanoes. It is formed spontaneously wherever sulphurous organic matters are undergoing putrefaction, as, for instance, in stagnant sewers and cess-pools, and in waters charged with organic matter and sulphates, especially sulphate of lime.

There are several ways of preparing this gas, which is very extensively used in laboratory operations. The following is that which is most commonly employed. Sulphide (the old sulphuret) of iron, in small fragments, is placed in a bottle, and dilute sulphuric acid is added. Water is decomposed, its hydrogen combining with the sulphur of the sulphide to form hydrosulphuric acid, which

escapes as a gas, while its oxygen enters into combination with the iron, forming oxide of iron (FeO), which unites with the sulphuric acid to form the ordinary protosulphate of iron or green vitriol, which remains in solution. The reaction is expressed by the equation :

Hydrosulphuric acid is a colourless gas of a strong and very nauseous odour, resembling that of rotten eggs. It consists of two volumes of hydrogen and one volume of sulphur vapour condensed into two volumes, which form its combining measure. It is about seventeen times heavier than hydrogen. By pressure, it is liquefied, and by the additional application of cold, it may be obtained in the solid form (see GASES). Water dissolves, at 59°, 3.23 volumes of this gas, but the solution soon becomes milky when exposed to the air, in consequence of the oxygen of the air combining with the hydrogen of the gas, and sulphur being precipitated. It is highly combustible, and burns with a pale blue flame, producing water and sulphurous acid, and, generally, a deposit of sulphur. It has a weak acid reaction, and forms one of the hydracids. Although a feeble acid, it combines readily with bases.

Its use as a reagent is dependent on the fact, that many of the sulphides which it forms with metallic oxides are insoluble in water, and are thrown down from solutions as precipitates with characteristic colours. Thus the gas, or a watery solution of it, gives an orange precipitate with the compounds of antimony—while with those of arsenic it gives a yellow—with those of lead and of silver, a black—and with those of zinc, a white precipitate.

The air of a room slightly impregnated with this gas may be breathed with impunity, but a small quantity of the undiluted gas inspired produces faintness, and its respiration, in a very moderate proportion, was found by Thénard to prove fatal—birds perishing in air which contained $\frac{1}{1000}$ th, and a dog in air containing $\frac{1}{8000}$ th part of this gas. Its poisonous effects are best counteracted by the inhalation of very diluted chlorine gas, which may be readily obtained from a little chloride of lime placed in the folds of a napkin moistened with vinegar.

A very minute trace of this gas may be detected by placing a piece of paper, moistened with a strong solution of sugar of lead, over the vessel or aperture—as, for instance, over an opening in a drain—from which we think it is escaping. If it be present, a more or less black—often only a brown—tint is developed after a few minutes, in consequence of the formation of sulphide of lead.

HYDROTHORAX (derived from *hydōr*, water, and *thorax*, the chest) is the term applied to dropsical collections in the Pleura (q. v.), a closed serous sac enveloping the lung on either side. When it exists to any extent, the pressure which it exerts on the lungs impedes the passage of the blood through them, and occasions difficulty of breathing, lividity of countenance, &c. ; and more or less dropsy in the face, ankles, &c., soon appears. The physical signs by which the disease can be detected are too purely professional for these pages.

The causes of hydrothorax are various. It may depend upon inflammation of the secreting membrane, or it may be a consequence of organic disease of the heart or lungs. With regard to treatment when the disease seems to depend upon inflammation of the pleura, great advantage may often be derived from occasional cupping and repeated blistering. The most popular internal remedy is a combination of squill and either calomel

or blue pill, which must be continued till slight symptoms of salivation manifest themselves.

HYDROZO'IA. See ZOOPLYTES.

HYÈRES, or HIÈRES, a small town of France, in the department of Var, is situated three miles from the Mediterranean, and eight miles east of Toulon. It is celebrated for the beauty of the situation and the mildness of the climate, and is therefore much resorted to by foreigners suffering from chest or nervous complaints. Near the coast lie the Îles d'Hières, called by the ancients the Stœchades, which, with the exception of the military garrisons of a few forts, are uninhabited. Here, the heat of the climate is tempered by the sea-breezes, and the season seems an eternal spring.

HYGIE'IA—in the classical mythology, the goddess of Health—the daughter of Æsculapius. She was worshipped at Athens, Corinth, Argos, and other important cities, and in works of art is usually represented as a blooming virgin, with a snake, the symbol of health, which drinks from a cup held in her hand.—

HYGIE'IA is the name of one of the newly-discovered Planetoids (q. v.).

HYGRO'METER (Gr. *hygros*, moist, *metron*, measure), an instrument for measuring the quantity of moisture in the atmosphere. The earlier forms of hygrometer depended upon the property possessed by some substances of readily absorbing moisture from the air, and being thereby changed in dimensions or in weight. Of this kind was the hair hygrometer of Saussure, in which a hair, which expands and contracts in length according as the air is more or less moist, was made to move an index; a similar instrument was the whalebone hygrometer of Deluc; but as other causes as well as moisture affect such instruments, they afford no accurate indications. The most perfect hygrometer, theoretically, is that of J. F. Daniell (q. v.). It consists of two bulbs connected by a bent tube, as represented in the figure, and enclosing a thermometer, together with some ether and vapour of ether, the air having been expelled.

The bulb, *b*, is covered with muslin, and *a* is either blackened or coated with metal. The observer's hand is placed for a short time on *b*, to drive the ether into *a*, leaving *b* and the tube filled with vapour of ether. A little ether is then dropped from a flask, of the form *c*, on the muslin-covered bulb; evaporation instantly takes place, and produces a cooling of *b*, which condenses the vapour inside; a fresh evaporation from *a* fills the vacuum, which is again condensed by dropping ether on *b*, and the process is repeated till the temperature of *a* is so reduced by successive evaporations (see EVAPORATION), that dew begins to be formed on the outside of the bulb. At

Hygieia.

the instant this occurs, the height of the mercury in the two thermometers is accurately noted, the one giving the dew-point temperature, and the other the temperature of the air. The actual quantity of moisture contained in a cubic foot of air can now be readily found from the following empirical formula: weight of moisture in grains = $\frac{5656 \cdot 2}{448 + t} \times p$;

where t is the temperature of the air at the time of observation, and p (found from tables) the elasticity of vapour at the temperature of the dew-point. The evident defects of this instrument are, first, its rapidity of operation, so that no time is allowed for the glass, ether, and thermometer to come to the same temperature, and, in consequence, the dew-point is given higher than it actually is; secondly, its costliness, owing to the great consumption of ether; and, thirdly, its uselessness in tropical countries, owing to the difficulty of preserving the ether in a fluid state. Daniell's hygrometer was used at the Royal Observatory, Greenwich, from 1840—the commencement of meteorological observations—till 1847, when it was superseded by the more convenient instrument, the WET AND DRY BULB THERMOMETERS. This instrument consists of two thermometers—one of ordinary construction, which serves to give the temperature of the air; the other has its bulb covered with a piece of muslin or other similar material, to which is attached an absorbent wick, communicating with a vessel of rain-water, an arrangement by which the muslin is kept constantly wet. The evaporation from the muslin, and consequent cooling of the bulb, being in proportion to the dryness of the air; the difference between the readings of the two thermometers will be greatest when the air is driest, and zero when it is completely saturated with moisture. The height of the mercury in each of the thermometers being found, the elastic force of vapour at the dew-point is calculated by the formula of Dr Apjohn (*Proceedings of the Royal Irish Acad.*, 1840):

$$(1) F = f - \frac{d}{88} \cdot \frac{h}{30}; \quad (2) F = f - \frac{d}{96} \cdot \frac{h}{30};$$

the first formula to be used when the wet thermometer is above, and the second when it is below, the freezing-point (32°). In these formulæ, F is the elastic force of vapour at the dew-point; d , the hygrometric depression, or depression of the dew-point; h , the height of the barometer. After F has been determined, the quantity of moisture in a cubic foot of air can be found as before. (In these calculations, the *Hygrometric Tables* of Mr Glaisher will be found to be of great use.)

HYKSHOS, the name of an Egyptian dynasty, generally known as the Shepherd Kings, derived from *hyk*, a ruler, and *shos*, a shepherd; or, according to another version, from *hyk*, a captive, and *shos*, a shepherd. According to Josephus and Africanus, they consisted of six or eight kings, named (1), Salatis, Silitis, or Saïtes, who reigned 19 or 15 years; (2), Beon, Banon, or Bnon, who reigned 43 or 44; (3), Apachnas, Apachnan, or Pachnas, who reigned 36 or 61 years; (4), Apophis, Aposhis, who reigned 61; (5), Anas, or Anan, who reigned 50; (6), Archles, who reigned 49; (7), Assis, or Assteth, who reigned 49 years and 2 months; and (8), Apobis, who reigned 61 years. The greatest discrepancy exists in the names and their arrangement, and as to the total number of years of the dynasty. Manetho, according to Josephus, states that they reigned 511 years, but the total of the reigns he cites amounts to only 259 years 10 months; while Africanus makes their duration 284 years, and Eusebius 103. Africanus makes the Shepherds consist of the

15th, 16th, and 17th dynasties, and to have ruled 953 years, but only gives the names and reigns of one, which he calls the 15th; while Eusebius makes them more correctly the 17th dynasty. They are stated in the Egyptian annals to have been a race of conquerors sprung from the East, who, under Salatis, their first king, took Memphis, and rendered tributary the whole of Egypt, and fortified the city of Avaris, on the east of the Bubastite arm of the Nile, where he maintained a garrison of 240,000 soldiers. Their oppression, however, drove the Egyptians to revolt, and under Taakan, the predecessor of Aahmes or Amasis I. of the 18th dynasty, a religious quarrel about the temples of Ra or the sun, and of Set, the god of the H., seems to have commenced, when a long war broke out, which ended under Aahmes, with the siege of Avaris, and a king who is called Misphragmuthosis, supposed to be a Thothmes, finally drove them out. The monument of an officer, named Aahmes-Penneben, at El Kab, recounts this siege and his exploits. Finally, according to Manetho, they departed under treaty. The great interest attaching to the H. is, that they were confounded with the Hebrews, or supposed to be the monarchs under whom Joseph entered Egypt, by the old ecclesiastical writers. In the monuments and the papyrus of Turin, in which portions of their names occur in the list of the kings, they bear the full titles of monarchs, although the papyri state that there were no kings in Egypt at the time, and that Taakan was only himself a *hek*, or prince of the south. The H., on a contemporary inscription remaining at El Kab, are called *Mena*, or Shepherds. The H. were by no means the devastating conquerors described by the historian. They entered Egypt, it appears from the monuments, about the 14th Egyptian dynasty, and were content with inscribing their names and titles on the monuments of their predecessors, the name of Appapus having been found on a colossus of Sebakhetp III. of the 13th dynasty, and on that of a king of the 14th dynasty at San. Traces of that of Saïtes or Salatis have been also found at Tel-Mokdam or Cynopolis. The greatest divergence of opinion has prevailed amongst authors as to their race and origin. Josephus calls them Hebrews or Arabs; the Syncellus, Phœnician shepherds. They have also been supposed to be Idumæans, Ishmaelites, or Scythians. Their physiognomy seems to indicate a Semitic origin, while their worship of Set connects them with the Khita, a people to the north of Palestine, on the confines of Mesopotamia. The names of the kings exhibit no foreign peculiarities; some are purely Egyptian. As regards the date of the H. dominion, the most conflicting opinions have prevailed amongst scholars. Bunsen makes their rule end 1639 B.C.; Lepsius, 1842 B.C. Placing, however, the discovered date of Thothmes III., 1445 B.C., in his 16th year, the close of H. dominion must have ended about 1500 B.C.

Bunsen, *Egypt's Place*, vol. ii. pp. 405, 578; Lepsius, *Königsbuch*; Boikh, Manetho, p. 231; De Verria, *Rev. Arch.* (1861), vol. iv. p. 249; Mariette, *Rev. Arch.* (1861), vol. iii. pp. 97, 247, 337.

HYLEOSAURUS (Gr. forest-lizard), a huge dinosaurian reptile, found in the Wealden strata of Kent and Sussex. Fragments of different individuals have been found sufficient to give an approximate notion of the affinities and great size of this reptile. The bones of the head have not yet been observed; its teeth were comparatively small, and close set; they seem to indicate that it was a vegetable eater. The body was broader than high, and terminated in a long slender flexible tail; the limbs were relatively short; the skin was covered with scutes and tubercles; and a row of very large

thin angular bony spines extended down the back, and formed a serrated dermal crest, like the horny spines of the modern iguana. It is supposed to have attained a length of 25 feet. The remains of only one species have been found; it has been named *H. Oweni*.

HYMEN, or **HYMENÆUS**, in Grecian mythology, the god of marriage; but originally, the word seems to have denoted only the bridal-song which was sung by the companions of the bride as she went from her father's house to that of the bridegroom. The god H. is first mentioned by Sappho. The legends concerning him are various; but he is generally said to be a son of Apollo and some one of the Muses. He is represented as a boy with wings and a garland, a bigger and graver Cupid, with a bridal-torch and a veil in his hands.

HYMENOPTERA (Gr. membrane-winged), an order of insects, containing a very great number of species, estimated at about one-fourth of the whole class, and of which some, as ants and bees, are singularly interesting and important. They have the mouth furnished with mandibles for cutting and tearing, but the other parts of the mouth are adapted for suction, and are generally narrow and elongated, often united into a kind of proboscis, as in bees. See **BEE**. The antennæ are generally slender, but often exhibit differences in the sexes of the same species. The wings are four in number, the first pair larger than the second, the wings of the same side united in flight by little hooks. The wings, when at rest, are laid one over

Wing of Honey Bee.

another horizontally over the body. The wings are entirely membranous, not reticulated as in the *Neuroptera*, but with comparatively few nervures, the arrangement of which is so constant in the whole order, that particular names have been given to them and to the spaces between them, and their diversities have been made use of in classification. The wings are wanting in the imperfectly developed females (*neuters*) of some. Besides the ordinary eyes, all the H. have three small simple (or *stematic*) eyes on the top of the head. The abdomen is generally united to the thorax by a slender pedicel. The abdomen of the females is generally furnished with an organ capable of being protruded, but for different purposes in different sections of the order, it being in some of the hymenopterous tribes an ovipositor or borer, and in others a sting. The H. in their perfect state generally feed on honey, but some of them prey on other insects, which are the food of the larvæ of a greater number; whilst the larvæ of some feed on various vegetable substances. The metamorphoses of the insects of this order are perfect; the larvæ are generally—although not in all the families—destitute of feet; the pupæ take no food. The H. are remarkable for the dilatation of the *tracheæ* or air-tubes into vesicles, and the general perfection of the respiratory system. The instincts, and even apparent intelligence, displayed by some of them—particularly the *social* kinds, which live in communities—have excited admiration from the earliest times.—The order is divided into two sections—*Terebrantia*, having an ovipositor; and *Aculeata*, having a poison-reservoir and sting. To the former belong saw-flies, gall-flies, ichneumons, &c.; to the latter belong ants, bees, wasps, &c.

HYMETTUS, a mountain in Attica, now called Trelo Vouni, situated to the south-east of Athens, and famous among the ancients for its honey and its marble. The honey still retains its reputation.

HYMN, a canticle of praise or of prayer addressed to the divine honour. The word in its strict acceptation supposes a certain metrical structure, or at least some kind of rhythmical cadence. The use of hymns dates from the earliest days of Christianity (Matt. xxvi. 30; Col. iii. 16); but our information as to the hymns of the early ages, and still more as to their authors, is extremely imperfect. The *Te Deum* is variously ascribed to St Ambrose, St Hilary, to Abundius, and to a monk named Sissabul. To Prudentius, with greater certainty, are assigned the *Hymn of Holy Innocents*, *Salvete Flores Martyrum*, and the *Ales Dei Nuntius*. Even the names of the authors of the more modern hymns are often involved in mystery; but some of the most esteemed hymns are known as the productions of Sedulius, of Fortunatus, of Paul the Deacon, of St Bernard, and St Thomas. The number of hymn-writers in the modern languages is so great as to preclude the possibility of any enumeration. The most complete modern collection of medieval Latin hymns is Mone's *Hymni Latini Medii Ævi*, 3 vols. 8vo. Friburg, 1856.

HYOSCYAMUS. See **HENBANE**.

HYPATIA, daughter of Theon, an astronomer and mathematician of Alexandria, and head of the Neo-Platonic school in that city, was born in the latter part of the 4th century. She was equally remarkable for her beauty, her wisdom, and her tragic fate. From her earliest youth, she exhibited an amazing intelligence, in consequence of which, her father, one of the most erudite savans of his time, resolved to give her genius a thoroughly philosophic culture. She succeeded her father in the chair of philosophy at Alexandria; and the fame of her lectures drew round her students from all parts of the East where the influence of Greek thought and knowledge was felt. H. seems to have been worthy of the lofty eulogies she has received. Amid the widespread corruptions of Alexandria, she lived as spotless as a vestal; and if her teaching was not one that could lay a strong hand on the vices of heathenism, and arrest their course, it was at least sufficient not only to preserve herself from pollution, but also to inspire her with a love of beauty, truth, and goodness, that was Christian in its spirit and earnestness, if heathen in its form and limitations. The citizens of Alexandria were proud of her; and such reliance was placed on her judgment and sagacity, that the magistrates used frequently to consult her on important cases. Among those who were most intimate with her was Orestes, prefect of the city. At this time, the Bishop of Alexandria was Cyril (q. v.), a fierce hater of heathens and heretics. Detesting Orestes, whom he suspected of being no true Christian, and who had drawn up an accusation against him for exciting a tumult, he soon cast an evil eye on H., whom he regarded as a Satanic enchantress, and the grand obstacle to his reconciliation with the prefect. His hatred communicated itself to the lower clergy, and especially to certain savage monks from the Nitrian deserts, who, headed by one Peter, a reader, attacked H. in the streets as she was returning from her lecture-room. The maiden was dragged from her chariot, hurried to the Casarian Church, where she was stripped naked, and murdered with tiles, after which she was torn to pieces, and her limbs carried to a place called Cinaron, and there burned to ashes, 415 A. D.

HYPERÆSTHESIA (derived from *hyper*, over, and *æsthesia*, a sensation) include those affections which have this property in common—viz., an exalted irritability and increased irritation of the

nerves. Hyperæsthesia of the cutaneous nerves is manifested by pain in its various modifications, which is sometimes intensely severe, as in Tic Douloureux (q. v.), while hyperæsthesia of the nerves of special sense is manifested by phantasms, illusions, &c. The following points are common to the whole class of these affections: 1. Periodicity, or the alternations of paroxysms and intermissions; 2. Uniformity and persistence of the symptoms, however long the duration of the disease; 3. No danger to life; 4. Freedom from this class of diseases in early life. Of the diseases predisposing to hyperæsthesia, hysteria is far the most frequent; but it is sometimes induced by rheumatism, gout, skin-diseases, &c.

HYPERBOLA. If two similar cones be placed apex to apex, and with the lines joining the apex and centre of base in each, in a straight line; then if a plane which does not pass through the apex be made to cut both cones, each of the two sections will be a *hyperbola*, as PBN, P'AN'. It is, viewed analytically, the locus of the point to which the straight lines EP, FP differing by a constant quantity are drawn from two given points, E and F. These given points are called the *foci*,

one being situated in each hyperbola. The point G, midway between the two foci, is called the *centre*, and the line EF the *transverse axis* of the hyperbola. A line through G perpendicular to the transverse axis is called the *conjugate axis*; and a circle described from centre B, with a radius equal to FG, will cut the conjugate axis in C and D. If G be taken for the origin of co-ordinates, and EM and E'F' for the axes, the hyperbola is expressed by the equation $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$. (GB = a, GC = b). The

hyperbola is the only conic section which has Asymptotes (q. v.); in the figure these are GT, GT', GS, GS'. It also appears that if the axes of co-ordinates be turned at right angles to their former position, two additional curves, HCK, H'DK', will be formed, whose equation is $\frac{x^2}{b^2} - \frac{y^2}{a^2} = 1$. These

two are called *conjugate hyperbolas*, and have the same asymptotes as the original hyperbolas. These asymptotes have the following remarkable property: If (starting from G) the asymptotes be divided in continued proportion, and from the points of section lines be drawn parallel to the other asymptote, the areas contained by two adjacent parallels and the corresponding parts of the asymptote and curve are equal; also lines drawn from the centre to two adjacent points of section of the curve, enclose equal areas. The equation to the hyperbola when referred to the asymptotes is $xy = ab$; which shews that as the ordinates decrease in geometrical progression, the abscissæ increase in the same ratio.

HYPERBOLÉ (Gr. *hyper*, over, and *ballein*, to throw) is the name given to a figure of rhetoric, by which expressions are employed that, taken literally,

signify more than is really meant. The use of the figure is to arrest the attention. Hyperbole is the basis of many metaphors. Thus, we call Nero a 'monster;' Tamerlane, a 'tiger;' and so on.

HYPERBOREANS (that is, dwellers beyond Boreas or the North Wind), a name given by the ancients to all the unknown peoples of the West and North. The Greeks imagined the country north of the Rhipæan (generally supposed to be the Ural) Mountains to be inhabited by the H., and their residence was gradually referred to more distant regions; but it was universally supposed that, as the favourites of Apollo, they enjoyed a terrestrial paradise, a bright sky, and a perpetual spring, a fruitful land, and everlasting youth and health.

HYPERICA'CEÆ, or HYPERICINÆ, a natural order of exogenous plants, containing about 300 known species, trees, shrubs, and herbaceous plants, widely distributed over the world, and in very different climates, but particularly numerous in North America. The leaves are generally covered with pellucid dots, and the edges of the leaves, sepals, and petals bordered with black glands. The stamens are united at the base, and grouped in from 3 to 5 bundles.—The species of *Vismia* yield a substance resembling gamboge. Many of the H. belong to the genus *Hypericum*, or St John's Wort, of which some species are common natives of Britain, adorning woods, heaths, &c., with their bright yellow flowers. *H. calycinum*, a spreading shrubby species, naturalised in some places in Britain, has flowers more than two inches in diameter. *H. perforatum*, the common or true St John's Wort, has astringent properties, and is used for gargles and lotions, and internally in dysentery, &c., although not recognised in the pharmacopœia. Superstitious notions are connected with it in many parts of Europe, particularly when gathered on the day of St John the Baptist.—*H. Androsæmum* (or *Androsæmum officinale*), commonly called Tutsan, a pretty common native of Britain, with berry-like fruit, was once in great esteem as a vulnerary. Its English name is *Tutsan*, from the French *tout saint*, all whole.

HYPERION. See TITANS.

HYPERSTHENE, a mineral closely related to augite and diallage. It is a bisilicate of iron and magnesia. It is crystalline, but often found granular or disseminated. Viewed in one direction, with reference to its cleavage planes, it is copper-coloured, in another it is dark brown. When cut and polished, it is cherry-red, with a pearly lustre, and is valued for rings, brooches, &c. The finest specimens are brought from the coast of Labrador, although it is found in Norway, Sweden, Germany, Scotland, &c. It is sometimes found in connection with felspar, forming *Hypersthene rock*, a rare kind of trap rock.

HYPERTROPHY (Gr. *over-nourishment*) is the term applied in medicine to the enlargement of certain organs of the body. The best examples of this change are seen in the muscular system, where it may occur altogether independently of disease. The huge bosses of flesh that stand prominently forward in the arm of a blacksmith or of a pugilist, and in the leg of an opera-dancer, are illustrations of hypertrophy, where the general health may be perfect. In double organs, such as the kidneys and lungs, if the organ on one side degenerates through disease, the organ on the opposite side is often found to enlarge, and carry on double work. In these cases, hypertrophy is an effect of disease, but is at the same time a resource of nature to preserve life.

There are, however, cases in which the hypertrophy has a hurtful instead of a conservative

effect, as, for example, hypertrophy of the thyroid gland, constituting the disease known as goitre or bronchocele, hypertrophy of the prostate gland, of the spleen, &c. The following are, according to Mr Paget, the conditions which give rise to hypertrophy: 1. The increased exercise of a part in its healthy function; 2. An increased accumulation, in the blood, of the particular materials which a part appropriates in its nutrition or in secretion; 3. An increased afflux of healthy blood. In hypertrophy of the muscular tissue, the first and third of these conditions are present. In hypertrophy of the fatty tissue, constituting obesity, there is an excess of fat or of its chief elements in the blood.

HY'PHASIS. See **SUTLEJ.**

HY'PHEN (Gr. together, in one), the name given to a mark in writing, thus (-), indicating that two words or syllables are to be connected; e. g., bull-fight.

HY'PNOTISM (from the Greek word *hypnos*, sleep) is a term invented by the late Mr Braid, of Manchester, to designate certain phenomena of the nervous system which in many respects resemble those which are induced by animal magnetism, but which clearly arise from the physical and psychical condition of the patient, and not from any emanation proceeding from others. The following are his directions for inducing the phenomena, and especially the peculiar sleep-like condition of hypnotism. Take a silver lancet-case or other bright object, and hold it between the fingers of the left hand, about a foot from the eyes of the person experimented on, in such a position above the forehead as to produce the greatest strain on the eyes compatible with a steady fixed stare at the object. The patient must be directed to rivet his mind on the object at which he is gazing. His pupils will first contract, but soon dilate considerably; and if, after they are well dilated, the first and second fingers of the operator's right hand, extended and a little separated, are carried from the object towards the eyes, the eyelids will most probably close with a vibratory motion. After ten or fifteen seconds have elapsed, it will be found that the patient retains his arms and legs in any position in which the operator places them. It will also be found that all the special senses, excepting sight, are at first extremely exalted, as also are the muscular sense and the sensibility of heat and cold; but after a time the exaltation of function is followed by a state of depression far greater than the torpor of natural sleep. The patient is now thoroughly hypnotised. The rigidity of the muscles and the profound torpor of the nervous system may be instantly removed, and an opposite condition induced by directing a current of air against the muscles which we wish to render limber, or the organ we wish to excite to action; and then by mere repose the senses will speedily regain their original condition. If a current of air directed against the face is not sufficient to arouse the patient, pressure and friction should be applied to the eyelids, and the arm or leg sharply struck with the open hand.

From the careful analysis of a large number of experiments, Mr Braid is led to the conclusion, that by a continual fixation of the mental and visual eye upon an object, with absolute repose of body and general quietude, a feeling of stupor supervenes, which renders the patient liable to be readily affected in the manner already described. As the experiment succeeds with the blind, he considers that 'it is not so much the optic, as the sentient, motor, and sympathetic nerves, and the mind, through which the impression is made.'

Many of the minor operations of surgery have

been performed on patients in the hypnotised state without pain, and hypnotism has been successfully employed as a therapeutic agent in numerous forms of disease, especially such as have their seat in the nervous system. An interesting memoir *On Hypnotic Therapeutics* was published by Mr Braid in the 17th volume of *The Monthly Journal of Medical Science* (1853).

HYPOCAUST, a form of furnace much used by the Romans, for the purpose of heating baths and apartments. The fuel is placed in a chamber under the floor, and the smoke and heated air are made to circulate round the walls and under the floor, by means of hollow tubes, or a hollow lining. The full benefit of the fire is thus obtained, in place of a large portion of the heat being allowed to escape, as it does, in the case of an open fireplace, up the chimney. The Romans invariably used this form of furnace for heating their dwelling-houses, and in all the Roman houses which have been discovered in this country, remains have been found of the hypocaust. It is now coming again into use for heating the so-called 'Turkish Baths.'

HYPOCHÆRIS, a genus of plants of the natural order *Compositæ*, sub-order *Cichoraceæ*, of which one species, *H. radicata*, or Long-rooted Cat's-ear, is extremely common in meadows and pastures in Britain. Its leaves are all radical, and spread on the ground, resembling in form those of the dandelion, but rough; the stem is branched, the flowers not unlike those of the dandelion, but smaller. Cattle eat this plant readily, and its abundance is not deemed injurious to pasture or fodder.

HYPOCHLO'ROUS ACID (ClO) is a dark red fluid, which, at a temperature of about 70°, becomes converted into an orange-coloured gas, which very readily explodes into its ultimate constituents. A watery solution of this gas has a penetrating, chlorine-like odour, a caustic action on the tongue, colours the skin brown, and if applied for any length of time, causes it to ulcerate. It is the active ingredient of the different bleaching-powders and salts. Its salts—the hypochlorites—present very much the same odour as the acid. Their solutions bleach organic pigments, such as litmus and indigo, and are employed largely as bleaching agents.

HYPOCHO'NDERS (Gr. *hypo*, under; *chondros*, a cartilage) are the two lateral and superior regions of the Abdomen (q. v.) under the cartilages of the false ribs, and to the right and left of the epigastrium.

HYPOCHONDRI'ASIS (so called from its supposed connection with the hypochondriac regions of the abdomen), a disease characterised by extreme increase of sensibility, palpitations, morbid feelings that simulate the greater part of diseases, exaggerated uneasiness and anxiety, chiefly in what concerns the health, &c. In extreme cases it becomes a species of insanity (see below). The disease is intimately connected with, if not caused by, disorder of the digestive functions. See **INDIGESTION**.

Hypochondriacal Insanity.—When sombreness of disposition and anxiety concerning personal comfort become exaggerated, and attention is directed chiefly to the state of the health, it amounts to common hypochondriasis. When it passes beyond the control of the will, when the whole mind is directed to the state of the system, or to particular organs, and exalts and misinterprets sensations, the condition is designated hypochondriacal insanity. The disease may be described as the engrossment of the attention by false impressions conveyed, or

conceived to be conveyed, from internal organs. These sensations may, in many instances, be real, and proceed from actual alterations in the structure or functions of the parts supposed to be affected; but they may likewise consist of ordinary sensations, excited and intensified by the act of attention which makes them known to the patient. Neither the experience nor the sufferings of the victims are imaginary, however absurd their errors, and however groundless their apprehensions may be; the disease consists in the exaltation of sensibility and attention, and in the delusions which originate in that morbid state. A man lives in constant fear of death; he is firmly convinced that he labours under cancer, consumption, disease of the heart, and lives upon drugs; that his stomach, or bowels, are contracted, or the abode of frogs, a fetus, or an army of soldiers; that his legs are transformed into glass or ice; that his whole body has assumed the shape of a teapot, or the magnitude of a hippopotamus. It is often a precursor of melancholia, as in the case of Cowper the poet, and other kinds of alienation; but it must likewise be regarded as a distinct and independent affection, traceable, generally, to dyspepsia, or disorder of the digestive and assimilative apparatus. It is probable that shades and degrees of this malady may constitute those links which connect partially healthy from absolutely unsound minds. In females, there are often added to the phenomena already described many of the symptoms of hysteria and great impressionability, and even convulsive affections; there is likewise encountered the simulation of diseases, the tendency to deceive others after having deceived themselves into the belief that they are invalids, and labouring under grievous and incurable disorders. They crave sympathy and support, as subject to affections of the spine, the joints, the lungs. They abstain from food, or devour inedible and disgusting substances; they writhe in what appears excruciating pain, and they voluntarily sustain great suffering during the treatment of their fancied ailments. A patient of Dr Page, Carlisle, underwent amputation of the finger, wrist, forearm, and ultimately of the arm, in order to be relieved of sores which she produced. Certain of the maladies which are pretended, or feared, or fancied, appear to be called into existence under the morbid influence of volition: and there are strong grounds for believing that the concentration of attention upon a particular function, not merely interferes with its exercise, but disturbs the physical condition, and leads to degeneration of the tissue of the organ with which it is connected by capillary congestion, or evolution of nerve-force. —Falret, *De l'Hypochondrie et du Suicide* (1822); Andrew Combe, *On Hypochondriasis, Phrenological Journal*, vol. iii. p. 51; Cheyne, *The English Malady* (1733); Arnold, *Observations on Nature, Kinds, &c., of Insanity* (1782).

HYPOTASIS (Gr. *Hypostasis*, subsistence), the term employed by Greek theological writers to designate the distinct subsistence of the three persons of the Trinity. Originally, the meaning of the word was unsettled. It was used by the Fathers of the council of Nice, in the sense of *ousia*, essence or substance, and this confusion of phraseology supplied the most formidable weapon to the semi-Arians in the controversy about the Homoousian (q. v.). The use of the word *hypostasis*, however, was settled at a synod held by Athanasius in 357, in which it was fully distinguished from *ousia*, and explained as synonymous with *prosopon*, which the Latins rendered by *persona*, person. From this time, the word was adopted into the theological language of the Latin Church, in which it is used indiscriminately with *persona*.

HYPOTASTIC UNION (Gr. *Hypostasis*, person), a union of natures or substances so intimate as to constitute one undivided person. The term is used to describe the mysterious union of the divine and human natures in Christ, in virtue whereof, while each nature is complete, even after union, yet each merges its separate personality in the undivided person of the God-man, to which all the actions, whether divine or human, are ascribed. This form of expression was devised for the purpose of excluding the doctrine of a mere moral union held by Nestorius. See **MONOPHYSITES**, **NESTORIANS**, **TRINITY**.

HYPOTHEC, a term in the law of Scotland, but not used in England, to denote a lien or security over goods in respect of a debt due by the owner of the goods. Thus, a landlord has a hypothec over the furniture or crops of his tenant in respect of the current rent; so a law-agent or attorney has a hypothec over the title-deeds of his client in respect of his account or bill of costs. In England, these rights are called liens, and are not so liberally allowed. See Paterson's *Comp. of E. and S. Law*, s. 594. There is also a hypothec in favour of seamen over the freight in respect of their wages.

HYPOTHECA'TION is the pawning of a ship for necessities, or to raise money in some critical emergency.

HYPOTHENUSE, the name of that side in a right-angled triangle which is opposite to the right angle. The well-known property of the hypotenuse, that the square described on it is equal to the sum of the squares described on the other two sides, is proved in the famous 47th proposition of the first book of Euclid's *Elements*, and has, in the sixth book, been generalised into the following form: The figure described on the hypotenuse is equal to the similar figures described on the other two sides. It is said that the 47th proposition was discovered by Pythagoras, who was so overjoyed at his good fortune, that he sacrificed a hecatomb to the Muses. Camerer, in his edition of Euclid, gives seventeen different demonstrations of this proposition.

HYPOTHESIS. In endeavouring to explain natural phenomena, we have often to assume or imagine a cause, which, in the first instance, we do not know to be the real cause, but which may be established as such when we find that its consequences agree with the phenomenon to be explained. Every genuine theory was at one stage a mere conjecture, and became a true theory in consequence of being proved or verified by the proper methods. Thus, when it occurred to Newton that the force of gravity on the earth, as exemplified in falling bodies, might extend to the distance of the moon, and might be the power that compelled it to circle round the earth, instead of going off in a straight line through space, the suggestion was only an hypothesis, until such time as he was able to shew that it accounted exactly for the facts, and then it became a theory.

A difference of opinion has arisen as to what constitutes a legitimate hypothesis, there being manifestly some necessary limits to the process of imagining possible causes. The case that has chiefly contributed to make this a question is the celebrated undulatory theory of light, a theory, or hypothesis rather, remarkable not only for the extent to which it explains the facts, but for having led to the discovery of new facts by way of inference from the theory itself. Notwithstanding all this amount of coincidence, the ethereal substance whose undulations are supposed to constitute light in its passage from the sun to the earth, is not known to have a real existence. It is an imaginary element, so

happily conceived as to express with fidelity a series of extremely complicated phenomena. This was not the character of Newton's hypothesis as to the motion of the moon; the power supposed by him (the earth's gravity) was an actual or existing force, and all he did was to suggest that it extended as far as the moon. Accordingly, M. Auguste Comte and Mr J. S. Mill have laid it down as the condition of a sound scientific hypothesis, that the cause assigned to the phenomenon in question should be either a real cause, or capable of being ascertained to be a real cause, and that the liberty given to the scientific inquirer should be confined to imagining its operation in a particular sphere, and the law and amount of its operation, since both these could be verified by experiment and calculation. On the other hand, Dr Whewell has contended, that an amount of agreement with observed facts, such as has been exemplified by the undulatory hypothesis, is sufficient to establish not merely an hypothesis, but a theory, at least until such a time as some discordant facts arise, when the theory must be modified or abandoned. But whatever name be given to this class of suppositions, it is evident that they must be deemed inferior in scientific value to the other class of suppositions, where no cause or agent is assumed but what is actually known to exist, and where the only question is, the presence of that agent in such manner and amount as to tally with the observed facts. Gravity, heat, electricity, magnetism, are established natural agents, and when we assume any one of these as the cause of some phenomena, we are on safe ground so far, that if it be once shewn that they are actually operative in the case we are dealing with, and that their calculated effect exactly coincides with the observed effect, the explanation is complete and final; no subsequent discovery can disturb a conclusion established in this way. But if we have to assume the very agency itself, or to imagine a power that we have no experience of, the coincidence between the laws of the assumed agency and the laws of the phenomena produces at best but a temporary or provisional evidence, which is liable to be superseded whenever a still better imagined machinery shall be brought forward. Thus, in the case of light, the first hypothesis, that of Newton himself, was a stream or shower of corpuscles; this gave way to the undulatory ether, whose merit lay in embracing the facts more closely; but we have no security against the ultimate preference of some third supposition which shall displace the second, as that did the first; while, perhaps, a day may come when an agency shall be proved to exist capable of explaining the phenomena. Even granting that we must sometimes assume an unknown agent (when an effect seems to be beyond the power of all the recognised forces), yet, in ordinary researches, it is considered a grave objection if the assumed agent be of such a subtle, or occult nature, or so far removed from observation, that its existence does not admit of being proved. Such was the doctrine of the Cartesian vortices, and such are any hypotheses as to the shapes, sizes, and distances of the ultimate atoms of matter. Such also is the doctrine of nervous fluids, whereby the impulses of mind are supposed to be propagated between the brain and the other parts of the body.

HYPOXANTHINE, a substance found in the spleen and muscles of the heart of man, and in the spleen and blood of the ox. It is a white crystalline powder, almost insoluble in cold hydrochloric acid, very slightly soluble in boiling alcohol, and requiring for solution in water 1090 equivalents of cold, or 180 of boiling water. Its solution has a neutral re-action.

HYPSILANTIS. See YPSILANTI.

HYRA'CEUM, a peculiar substance found in the crevices of the rocks of Table Mountain, Cape of Good Hope. It is one or more of the excrements of the Cape Hyrax (*Hyrax Capensis*). Hyraceum is a blackish-brown viscid material, not unlike soft pitch, having a strong and offensive taste, not unlike castoreum, for which it has been used as a substitute in medicine. At one time, so large a quantity was found as to suggest the idea of its being used as a manure, but the supply was soon exhausted, and only a small quantity is now imported to meet the demand of the curious pharmacist.

HYRACOTHERIUM, a genus of fossil Pachydermata, belonging to the division *Perrysodactyla*, the animals of which are characterised by having an odd number of toes. The genus was founded by Owen on the fragmentary remains of two species found in Lower Eocene strata; a third species from the same beds has been since described by him from more complete materials, under the name *Platolophus vulpiceps*; he considers it only a sub-genus, and as we can see no characteristics to separate it generically from the other two, we place it here as a true hyracothere. The fossil was discovered in a nodule from the Roman cement bed of the London Clay near Harwich. It is the most complete Eocene mammalian fossil of the London Clay. It consists of an entire skull and a portion of the rest of the skeleton, including the right humerus and femur, a great part of the left femur, the left tibia, and three metatarsal bones, apparently of the same foot, besides fragments of pelvis, ribs, and vertebrae. The head (fig. A 1 and A 2) is 5 inches long, and 2 inches 2 lines broad; it is slender, tapering

Hyracotherium :

- A 1, A 2, skull of *Hyracotherium* (*Platolophus*) *vulpiceps* (one-third natural size). A 3, molar tooth (natural size).
B 1, B 2, skull of *H. leporinum* (one-third natural size). B 3, molar tooth (natural size).
C 1, portion of lower jaw and tooth of *H. cuniculus* (natural size). C 2, molar tooth (natural size).

gradually from the zygomatic region to the muzzle; the upper outline is straight; the bony rim of the orbit is incomplete behind for about one-fifth of its circumference. The narrow skull and incomplete orbit ally it to the *Palaeothere*; the same form of orbit occurs also in the rhinoceros, and more exactly in the tapir. The straight contour of the skull, and the structure of the nasal aperture, shew affinities with the horse and hyrax. The third molar of the upper jaw (fig. A 3) shews the structure

of the teeth. The teeth, as well as the form of the lower jaw, tell plainly of the herbivorous character of the hyracothere. The bones of the leg exhibit ungulate affinities, and their form and proportions are between those of the hyrax and the tapir. The second species was founded on a mutilated cranium (fig. B 1, B 2), rather larger than a hare's, found in the cliffs of London Clay near Herne Bay. It shows a skull very like the first species, though broader at the orbital region. The third molar tooth (fig. B 3) has a larger number of cones than the same tooth in the first species. The third species was founded on several teeth which belonged to a smaller animal than either of the others, found in the Eocene sand underlying the Red Crag at Kyson, in Suffolk. The molar (fig. C 2) exhibits a structure similar to that of the others figured. From the same deposit were obtained two teeth belonging to a lower jaw, one of them, the third molar, still in its socket, and having a fragment of the jaw attached to it (fig. C 1). These teeth were considered by Owen to belong to a quadrumanous animal, and were described by him as *Macacus Eocenus*, 'at once the first terrestrial mammal which has been found in the London Clay, and the first quadrumanous animal hitherto discovered in any country in Tertiary strata so old as the Eocene period.' Since its publication, speculative geologists have made good service of this 'monkey.' Owen has, however, recently stated (*Ann. Nat. Hist.*, Sept. 1862), that the two teeth belong to the third species of hyracothere.

HYRAX. See DAMAN.

HYRCANIA, a district of ancient Asia, bounded on the N. by the Caspian Sea and the Oxus (sometimes called, in consequence, *Hyrcanum Mare*), on the E. and S. by the Elburz Mountains, which separated it from Parthia, and on the W. by Media. It corresponds with the modern Mazanderán and Asterabad. With the exception of the coast districts, and the valleys among the hills, which produced corn, oil, and wine, it was not a fertile region; dense forests prevailed, through which roamed multitudes of savage animals, the Hyrcanian tiger in particular being celebrated. The inhabitants were of the same stem as the Parthians, and were noted for their wild and rude character.

HYRCANUS, the name of two Jewish high-priests and princes of the Asmonean family.—1. JOANNES H., son of Simon Maccabeus, who ruled 136—106 B.C., was at first tributary to the Syrians; but on the death of Antiochus, made himself independent, subdued the Samaritans on the north, and forced the Idumæans on the south to adopt the laws and customs of the Jews. He also concluded an alliance with the Romans, or rather confirmed that which his father Simon had previously made; built the strong fortress of Baris on the north-eastern angle of Mount Moriah, and extended his territories almost to the ancient limits of the Davidian monarchy. He is also supposed to have founded the Sanhedrim (q.v.). Originally a Pharisee, he subsequently attached himself to the party of the Sadducees, who were anxious to keep on good terms with the Romans, and who discountenanced the turbulent religious patriotism of the Jewish masses. H. was, comparatively speaking, a just and enlightened ruler, and the country enjoyed great prosperity during his reign. He left five sons, two of whom, Aristobulus and Alexander, governed with the title of king.—2. HYRCANUS II., son of Alexander, and grandson of the preceding, was a feeble prince. On the death of his father (78 B.C.), he was appointed

high-priest by his mother Alexandra, who ruled Judæa herself for the next nine years. After her death (69 B.C.), his younger brother, Aristobulus, a braver and more energetic man, seized the government, and forced H. to withdraw into private life. Induced by the Idumæan, Antipater, and aided by Aretas, king of Arabia Petraea, he endeavoured to win back his dominions, but was not successful until Pompey began to favour his cause. After some years of tumultuous fighting, Aristobulus was poisoned by the partisans of Ptolemy (49 B.C.), and H., who had for some time possessed, if he had not enjoyed, the dignity of high-priest and ethnarch, was now deprived of the latter of these offices, for which, in truth, he was wholly incompetent. Cæsar (47 B.C.), on account of the services rendered to him by Antipater, made the latter procurator of Judæa, and thus left in his hands all the real power, H. busying himself only with the affairs of the priesthood and temple. Troubles, however, were in store for him. Antipater was assassinated, and Antigonus, son of Aristobulus, with the help of the Parthian king, Orodes I., invaded the land, captured H. by treachery, cut off his ears, and thus disqualified him for the office of high-priest, and carried him off to Seleucia on the Tigris. Some years later, Herod, son of his old friend Antipater, obtained supreme power in Judæa, and invited the aged H. home to Jerusalem. He was allowed to depart, and for some time lived in ease and comfort, but falling under suspicion of intriguing against Herod, he was put to death (30 B.C.).

HYRTL, JOSEPH, a distinguished anatomist, was born in 1811 at Eisenstadt, in Hungary, studied at Vienna, and early acquired eminence both as a scientific anatomist, and upon account of the extreme beauty of his anatomical preparations. He became Professor of Anatomy in Prague in 1837, and at Vienna in 1845. Whilst yet a student, he enriched the Anatomical Museum of Vienna with many preparations. He has contributed not a little to the progress of comparative anatomy, especially that of fishes, and has made the anatomy of the ear a subject of very particular investigation. Besides many articles in medical and scientific journals, he has published a number of works on the subjects above indicated; and a *Lehrbuch der Anatomie des Menschen* (2 vols. 1847; 4th ed. 1855), which has become a text-book in all the German universities, and has been translated into various languages. He has formed a museum of comparative anatomy in Vienna, which promises to become one of the finest in Germany.

HYSSOP (*Hyssopus*), a genus of plants of the natural order *Labiata*, distinguished by four straight diverging stamens, and a calyx with 15 ribs. The known species are few. The Common H. (*H. officinalis*) is a native of the south of Europe and the East. It is found on the Alps of Austria. It is a half-shrubby plant, about 1½ feet high, the upper part

Common Hyssop
(*Hyssopus officinalis*).

of the stems quadrangular, the leaves evergreen and lanceolate, the flowers in one-sided whorled racemes. The flowers are generally of a very beautiful blue. It has an agreeable aromatic odour. It has long been in cultivation for the sake of its leaves and young shoots, which are sometimes used for culinary purposes as a seasoning, but more generally in a dried state as a stomachic and carminative. A syrup made with them is a popular remedy for colds. The virtues of *H.* depend on a volatile oil.—It is very doubtful what plant is the *H.* of the Bible. It has been supposed to be some species of *Phytolacca* (q. v.), as *P. acinosa*, a native of the Himalaya; but of late, strong arguments have been advanced in favour of the common Caper (q. v.).—*HEDGE H.* is *Gratiola officinalis*. See *GRATIOLA*.

HYSTERIA (so called from the Greek word *hysteria*, the womb) is a disease which simulates so many other diseases, that it is not easy to describe it with the brevity which the limits of this work necessitate.

The hysterical fit or paroxysm—the most marked form or manifestation of the disorder—is almost, though not exclusively, confined to women, and chiefly to young women. In a severe case, the trunk and limbs are strongly convulsed; the patient struggles violently, retracting and extending her legs, and twisting her body with such force that the aid of three or four strong persons is often required to prevent a slight and apparently feeble girl from injuring herself or others. ‘The head,’ says Dr Watson in his Lectures, ‘is generally thrown backwards, and the throat projects; the face is flushed; the eyelids are closed and tremulous; the nostrils distended; the jaws often firmly shut; but there is no distortion of the countenance. If the hands are left at liberty, she will often strike her breast repeatedly and quickly, or carry her fingers to her throat, as if to remove some oppression there; or she will sometimes tear her hair, or rend her clothes, or attempt to bite those about her. After a short time, this violent agitation is calmed; but the patient lies panting, and trembling, and starting at the slightest noise or the gentlest touch; or sometimes she remains motionless during the remission, with a fixed eye; till all at once the convulsive movements are renewed; and this alternation of spasm and quiet will go on for a space of time that varies considerably in different cases; and the whole attack frequently terminates in an explosion of tears, and sobs, and convulsive laughter.’

In another less frequent form of the affection, the patient suddenly sinks down insensible and without convulsions: after remaining for some time in this state, with flushed cheeks, a turgid neck, and irregular breathing, she recovers consciousness, but remains for some time depressed in spirits and fatigued.

During the attack, especially in the first variety, the patient complains of uneasiness in the abdomen, and of a sensation as if a ball were rolling about, and rising first to the region of the stomach, and then to the throat, where she feels as if she were being choked. The abdomen is distended with wind, which moves, with a loud rumbling sound along the intestinal canal, and is often discharged by eructation. Towards the close of the fit, but more commonly after it is over, a large quantity of pale limpid urine is discharged.

In many respects, this affection resembles Epilepsy (q. v.). According to Dr Marshall Hall, the most essential difference is this: that in hysteria, much as the larynx may be affected, it is *never* closed; while in epilepsy, it is closed. Hence, in the former, we have heaving, sighing inspiration; and in the latter, violent, ineffectual efforts at expiration.

The hysterical fit varies in duration from a quarter of an hour or less to many hours.

The persons who suffer from hysteria are commonly young women in whom the process of menstruation is disordered, and who are either naturally feeble, or have been debilitated by disease or want; and in patients of this kind, the hysteria, or the hysterical tendency, is apt to shew itself in mimicking so faithfully many of the most important diseases, that the physician has often great difficulty in determining the true nature of the case. Among the disorders that may be thus simulated by hysteria are, inflammation of the peritoneum (or Peritonitis, q. v.), various forms of palsy, inflammation of the larynx (or Laryngitis, q. v.), inability to swallow (or Dysphagia), painful affection of the breast, disease of the hip and knee joints, and disease of the spine. Many of these cases of pseudo-disease come to a sudden favourable termination under some strong mental or moral emotions. Those who are old enough to recollect the morbid religious excitement that prevailed at the time when Irving and his followers believed in the ‘unknown tongues,’ can hardly fail to remember the remarkable, or, as many regarded it, the miraculous cure of a young paralytic lady, who was made to believe that if, on a certain day, she prayed for recovery with sufficient faith, her prayer would be answered, and she would recover at once. She did so, and her palsy instantly disappeared. This case, which was regarded by the believers in the movement as a direct answer to prayer, and as inaugurating a new era of miraculous cures, admits of easy and rational explanation by some psychologists. There are various instances on record where, in a similar way, an alarm of fire has instantly cured an hysterical paralysis that had lasted for years.

In the cases already noticed, the patient is not guilty of wilfully deceiving the physician; but in other instances they are found to practise the most remarkable impositions, pretending by various frauds to be suffering from spitting of blood, from stone in the bladder, &c., or to be living without food of any kind.

Hysteria is a very troublesome affection to deal with, because it is very readily induced by example, or, as Dr Watson terms it, is propagable by moral contagion. If, in a hospital ward or in a factory where many young women are congregated, one girl goes off in a fit, all the others who may happen to have a hysterical tendency will probably follow her example. In such cases, a decided order that the next girl who is attacked shall be treated with the actual cautery, or even with the cold affusion, will often have a marvellous effect in checking the spread of the disorder.

During the fit, the treatment to be adopted is to prevent the patient from injuring herself, to loosen her dress, and to admit an abundance of fresh cool air; to dash cold water upon the face and chest; and, if she can swallow, to administer a couple of ounces of the asafetida mixture, or a drachm of the ammoniated tincture of valerian in a wine-glass of water. After the paroxysm is over, the patient should have an active purge, and the bowels should be kept properly open by aloetic aperients; and the shower-bath, preparations of iron, and tonic treatment generally should be adopted, and all abnormal bodily and mental excitement, such as late parties in hot rooms, novel-reading, &c., should be carefully avoided.

I

I THE ninth letter in the alphabets of Western Europe, was called by the Greeks *Iota*, after its Semitic name (Heb. *Jod*), which signifies 'hand.' The oldest forms of the letter, as seen in the Phœnician and Samaritan, have a rude resemblance to a hand with three fingers; but by gradual simplification, the character came to be the smallest in the alphabet, and 'iota' or 'jot' is a synonym for a trifle. The original sound of the letter, and that which is considered its proper sound in all languages except English, is that given to Eng. *e* in *me*; with this power, it forms one of the fundamental vowels *i, a, u* (see **A** and **LETTERS**). What is called the long sound of *i* in Eng. is really the diphthong *ai* rapidly pronounced. The power that the vowel *i*, followed by another vowel, has of turning the preceding consonant into a sibilant, has been noticed in regard to the letter **C** (q. v.); further instances may be seen in such French words as *rage, singe*, from Lat. *rabies, simia*. In Lat., there was but one character for the vowel *i* and the semi-vowel now denoted by the character *j*. See **J**.

IAMBIC VERSE, a term applied, in classic prosody, and sometimes in English, to verses consisting of the foot or metre called *Iambus*, consisting of two syllables, of which the first is short, and the second long (—). Archilochus (q. v.) is the reputed inventor of iambic verse. The English language runs more easily and naturally in this metre than in any other. See **METRE, VERSE**.

Thē stāg | āt ēve | hād drūnk | hīs fill.

Lady of the Lake.

IAMBlichus, the proper name of several persons in classical antiquity, as—1. A king of Emesa, who, in the civil war, took the part of Antony.—2. A Syrian freedman, who flourished at the end of the reign of Trajan and beginning of that of M. Aurelius (117—169 A.D.). He was instructed by a Babylonian in the language, manners, and literature of Babylon, and wrote the *Babylonica*, or *Loves of Rhodanes and Sinonis*, in 16 or 39 books, which has been preserved by Photius, c. xciv., and Leo Allatius. It is the oldest of the novels of antiquity which has reached the present day, but is not of any great merit either as to style or plot. 3. A philosopher who flourished under Constantine about 310 A.D., born of an illustrious and wealthy family at Chalcis, in Cœle-Syria, pupil of Anatolius and Porphyry, and of the Neo-Platonic school of Plotinus, whose doctrines he extended. Little is known of his life; but he was followed by a numerous school, who listened with enthusiasm and respect, and who thought that he was inspired, had intercourse with the gods, and could divine and perform miracles. This gave him immense credit. His doctrines were a syncretic mixture of Pythagorean and Platonic ideas, mixed with superstition and magic, and the supposed manifestation of God by ecstasies, and a communication with the spiritual world by ceremonies. One of his great works; On the Choice of Pythagoras (*Peri Aïresos Pythagorou*) consisted of 10 books, of which there remains the

1st, A Life of Pythagoras, filled with prodigies, and evidently written against Christianity. 2d, An Exhortation to Philosophy (*Protreptikoi Logoi eis Philosophian*), an ill-arranged introduction to Plato. 3d, On the Common Knowledge of Mathematics (*Peri Koinos Mathematikes Epistemes*), full of fragments of Pythagoras, Philolaus, and Archytas. 4th, On the Arithmetical Introduction of Nicomachus. The 5th and 6th books are lost. The 7th, The Theology of Arithmetic (*Ta Theologoumena tes Arithmetikes*); the 8th, The History of Music; the 9th, Geometry; the 10th, On the Study of Heavenly Bodies. He also wrote a work on the Soul, commentaries on Plato and Aristotle, another on the complete Chaldaean Philosophy, another on Beginnings, and one on Sacred Images, in which he affirmed that the gods resided in their statues. His celebrated work on the Mysteries (*Peri Musterion*) is, however, disputed; it is supposed by Meiners not to be written by I.; but is asserted by Tennemann to be the work of this author. It is drawn up as the answer of Abammon, a priest, to a letter addressed to his pupil, Anebo, by Porphyry. It contains many Egyptian doctrines, and esoteric explanations derived from the Hermetic Books, the writings of Bitys and others, mixed with Pythagorean and Neo-Platonic ideas. The style of I. is not careful, and inferior to Porphyry. I. is supposed to have died at Alexandria, 333 A.D.—Several other writers of this name are known, as a younger philosopher of the Neo-Platonic school, born at Apamea, and supposed to be a nephew of the preceding, praised by Libanius to Julian the Apostate; another, son of Himerius, mentioned by the same author, and a physician at Constantinople.

Eudocia, *Violetum*, p. 244; Eunapius, *Vit. Philosoph.*, p. 20; Hebensbreit, *De Iamblichō* (Leip. 1744); Brucker, *Hist. Crit. Phil.*, ii. p. 260; *Iamblichus*, a Gale, fo. (Ox. 1678).

IBARRA, or SAN MIGUEL DE IBARRA, a town of Ecuador, South America, in the department of Quito, and 60 miles north-east of the town of that name. It is situated on the northern base of the volcano of Imbabura, is well built, and carries on manufactures of wool and cotton. Pop. estimated at about 10,000.

IBERIA. See **HISPANIA** and **GEORGIA**.

IBERIS. See **CANDYTUFT**.

IBEX, the ancient name of the Bouquetin (q. v.), or Steinbock of the Alps; and now, according to some zoologists, of a genus of the goat family, or sub-genus of goat, having the horns flat, and marked with prominent transverse knots in front, whereas those of the true goats are compressed and keeled in front, and rounded behind. The species are all inhabitants of high mountainous regions. The I. of the Caucasus and the I. of the Pyrenees differ a little from the I. of the Alps, and from one another, but the differences may perhaps be regarded as those of varieties rather than of species.

The conventional ibex represented in Heraldry resembles the heraldic antelope in all respects, except that the horns are straight and serrated.

IBICUI, or IBICUY, an important affluent of the Uruguay (q. v.).

IBIS, a genus of birds of the family *Ardeidae*, or, according to some ornithologists, of *Scolopacidae*, and perhaps to be regarded as a connecting link between them. The bill is long, slender, curved, thick at the base; the point rather obtuse; the upper mandible deeply grooved throughout its length. The face, and generally the greater part of the head, and sometimes even the neck, are destitute of feathers, at least in adult birds. The neck is long. The legs are rather long, naked above the tarsal joint, with three partially united toes in front, and one behind; the wings are moderately long; the tail

Sacred Ibis.

is very short. The SACRED I., or EGYPTIAN I. (*I. religiosa*), is an African bird, two feet six inches in length, although the body is little larger than that of a common fowl.—The GLOSSY I. (*I. falcinellus*) is a smaller species, also African, but migrating northwards into continental Europe, and occasionally seen in Britain. It is

also a North American bird. Its habits resemble those of the sacred ibex. Its colour is black, varied with reddish brown, and exhibiting fine purple and green reflections. It has no loose pendent feathers.—The WHITE I. (*I. alba*), a species with pure white plumage, abounds on the coasts of Florida. Audubon saw multitudes on a low islet, and counted 47 nests on a single tree.—The SCARLET I. (*I. ruber*) is a tropical American species, remarkable for its brilliant plumage, which is scarlet, with a few patches of glossy black.—The STRAW-NECKED I. (*I. or Geronticus spinicollis*) is a large Australian bird of fine plumage, remarkable for stiff naked yellow feather-shafts on the neck and throat.

The SACRED IBIS, one of the birds worshipped by the ancient Egyptians, and called by them *Hab* or *Hib*, and by the modern Egyptians *Abu-Hannes* (i. e., Father John), is a bird with long beak and legs, and a heart-shaped body, covered with black and white plumage. It was supposed, from the colour of its feathers, to symbolise the light and shade of the moon, its body to represent the heart; its legs described a triangle, and with its beak it performed a medical operation; from all which esoteric ideas it was the avatar of the god Thoth or Hermes (see HERMES), who escaped in that shape the pursuit of Typhon, as the hawk was that of Ra, or Horus, the sun. Its feathers were supposed to scare, and even kill, the crocodile. It appeared in Egypt at the rise, and disappeared at the inundation of the Nile, and was thought, at that time, to deliver Egypt from the winged and other serpents which came from Arabia in certain narrow passes. As it did not make its nest in Egypt, it was thought to be self-engendering, and to lay eggs for a lunar month. According to some, the basilisk was engendered by it. It was celebrated for its purity, and only drank from the purest water, and the most strict of the priesthood only drank of the

pools where it had been seen; besides which, it was fabled to entertain the most invincible love of Egypt, and to die of self-starvation if transported elsewhere. Its flesh was thought to be incorruptible after death, and to kill it was punishable with death. Ibises were kept in the temples, and unmolested in the neighbourhood of cities. After death, they were mummied, and there is no animal of which so many remains have been found at Thebes, Memphis, Hermopolis Magna, or Eshmun, and at Ibiu or Ibeum, fourteen miles north of the same place. They are made up into a conical shape, the wings flat, the legs bent back to the breast, the head placed on the left side, and the beak under the tail; were prepared as other mummies, and wrapped up in linen bandages, which are sometimes plaited in patterns externally. At Thebes, they are found in linen bandages only; well preserved at Hermopolis in wooden or stone boxes of oblong form, sometimes in form of the bird itself, or the god Thoth; at Memphis, in conical sugar-loaf-shaped red earthenware jars, the tail downwards, the cover of convex form, cemented by lime. There appear to be two sorts of embalmed ibises—a smaller one of the size of a cornerake, very black, and the other black and white—the *Ibis Numenius*, or *Ibis religiosa*. This last is usually found sometimes with its eggs, and with its insect food, the *Pimelia pilosa*, *Akis reflexa*, and portions of snakes, in the stomach. It is said to resemble the I. of India rather than Africa. By the Jews, it was held to be an unclean bird.—Wilkinson, *Manners and Customs*, v. 7, 217; Passolegna, *Catalogue Raisonné*, p. 255; Pettigrew, *History of Mummies*, p. 205; *Horapollo*, i. c. 30, 36.

IBRAHIM PASHA, the adopted son of Mohammed Ali (q. v.), the viceroy of Egypt, was born in 1789, and gave the first proofs of his gallantry and generalship in 1819, in quelling the insurrection of the Wahabis. He afterwards subdued Sennaar and Darfur. He invaded the Morea at the head of an Egyptian army in 1825, with the view of reducing it under the power of Mohammed Ali; but the intervention of the great powers in the affairs of Greece compelled him to abandon this enterprise in 1828. Mohammed Ali having conceived the design of adding Syria to his dominions, Ibrahim crossed the Egyptian border with an army in October 1831, took Acre by storm, and quickly made himself master of the whole of Syria. A peace was concluded on 4th May 1833, the Turks not only consenting to give up Syria, but also making over Adana to Ibrahim personally, on a kind of lease. When war broke out again between Mohammed Ali and the sultan in 1839, Ibrahim was again successful, totally routing the Turks in the great battle of Nisib on 24th June. The interference of the great powers, eventually compelled him to relinquish all his Syrian conquests, and to return to Egypt, suffering, during his passage through the desert, the most terrible hardships and losses, whilst the attempt to elevate Egypt to complete independence came to an end. In 1848, when the aged pacha had sunk into absolute dotage, I. went to Constantinople, and was installed by the Porte as Viceroy of Egypt; but on 9th November 1848, he died at Cairo. He was succeeded, not by any of his own children, but by Abbas Pasha (q. v.), the favourite grandson of Mohammed Ali.

IBRAÏL. See BRAHILOV.

ICE is water in the solid form. It is specifically lighter than water which is just about to freeze, and therefore swims in it. Water, in becoming solid, expands about $\frac{1}{10}$ of its volume or bulk. The formation of ice takes place generally at the surface of water. This is owing to the peculiarity, that

when water has cooled down to within $7^{\circ}4$ of freezing, it ceases to contract, as before, with increase of cold, and begins to expand until it freezes; which causes the coldest portions of the water to be always floating on the surface. In some circumstances, however, not very well explained, ice forms at the bottom of rivers, and is called ground-ice.

Water in ordinary cases freezes at the degree of heat marked 32° on Fahrenheit's thermometer, and 0° on the Centigrade and Reaumur's; but if it is kept perfectly still, it may be cooled to nearly 22° F. below freezing, and still remain liquid. The least shake, however, or the throwing in a solid body, makes a portion of it freeze instantly, and its temperature rises immediately to 32° . Sea-water, and salt water in general, freezes at a lower temperature than pure water; in doing which, part of the salt separates, and the ice, when melted, gives water that is fresher than the original. The colour of pure ice is deep blue, which is only discernible, however, when it is in large masses. It is best seen in the clefts of a glacier or an iceberg.

In the neighbourhood of the poles, and on mountains of a certain height in all latitudes, there exist immense masses of permanent ice; and even in some districts of Siberia, where a kind of culture is practicable in summer, there are found at a certain depth below the surface of the earth strata of ice mingled with sand. In sinking a well at Yakutsk, the soil was found frozen hard to the depth of 382 feet, and consisting in some parts entirely of ice. These permanent masses of ice must be classed with rocks and mountains, as among the solid constituents of the globe. In the lower regions of the torrid zone there is no ice, and in the temperate zones, it is a passing phenomenon. From the polar ice-fields and glaciers which are always protruding themselves into the sea, great floating masses become detached, and form *icebergs*, flocs, and drift-ice. These bergs or mountains of ice are sometimes more than 250 feet above the sea-level. They present the appearance of dazzling white chalk-cliffs of the most fantastic shapes. Fresh fractures have a green or blue colour. From the specific gravity, it is calculated that the volume of an iceberg below the water is eight times that of the protruding part. Icebergs, and flocs or ice-fields, are often laden with pieces of rock and masses of stones and detritus, which they have brought with them from the coasts where they were formed, and which they often transport to a great distance towards the equator. These floating masses of ice are dangerous to navigation.

The hardness and strength of ice increase with the degree of cold. In the severe winter of 1740, a house was built of the ice of the Neva at St Petersburg 50 feet long, 16 wide, and 20 high, and the walls supported the roof, which was also of ice, without the least injury. Before it stood two ice-mortars and six ice-cannon, made on the turning-lathe, with carriages and wheels also of ice. The cannon were of the calibre of 6-pounders, but they were loaded with only $\frac{1}{4}$ lb. of powder, and with hemp-balls—on one occasion with iron. The thickness of the ice was only four inches, and yet it resisted the explosion.

About twelve years ago, Faraday called attention to a remarkable property of ice, since (incorrectly) called *Regelation*. He endeavoured to account for the fact, that two slabs of ice, with flat surfaces, placed in contact, unite into one mass when the temperature of the surrounding air is considerably above the freezing-point, by assuming that a small quantity of water, surrounded on every side by ice, has a natural tendency to become ice; and the fact, that two blocks of ice placed in contact do not

unite unless they are *moist*, seems to bear out this idea. But J. Thomson gave a totally different explanation of this phenomenon. He shewed that the capillary force of the film of water between the plates is sufficient to account for a very considerable pressure between them; so that from his point of view the phenomenon would be identical with the making of snowballs by pressure; and the formation, by a hydraulic press, of clear blocks from a mass of pounded ice, an observed fact, the explanation of which is to be found in the property of ice mentioned below. See *Proceedings of the Royal Society*, 1860—1861. Faraday, taking up the question again, has shewn that the (so-called) regelation takes place in water as readily as in air, a fact quite inconsistent with the action of capillary forces. To this, J. Thomson has replied, shewing, very ingeniously, that the capillary forces he at first assumed are not necessary to a complete explanation of the observed phenomena. See reference above.

Other views of the question are numerous, for instance, that of Persoz, adopted by Forbes, in which ice is considered as essentially colder than water, and as passing through a sort of viscous state before liquefying, as metals do during the process of melting. This idea, however, has not of late found much support; and it is probable that the true solution of the question is, as J. Thomson has lately pointed out, to be found in the analogy of the crystallisation of salts from their aqueous solutions.

However that may be, there is no doubt about the following property of ice, theoretically predicted by J. Thomson from the experimental fact of its expanding in the act of freezing, and demonstrated by means of the Piezometer by W. Thomson—viz., that the freezing-point of water, or the melting-point of ice, is *lowered by pressure*; and the brothers have, with singular ingenuity, applied this to the explanation of the motion of glaciers. That a mass of glacier-ice moves in its channel like a viscous fluid, was first completely established by Forbes. Thomson's explanation of this motion is of the following nature: In the immense mass of the glacier (even if it were homogeneous, much more so when full of cracks and fissures, as it always is), there are portions subjected to a much greater strain than others. The pressure to which they are subjected is such as corresponds to a melting-point considerably below the temperature of the mass—and therefore, at such points, the ice melts, the strain is relieved, and the whole mass is free for an instant to move nearly as a fluid would move in its place. But, the strains being thus for an instant removed, the temperature and pressure of the water are again consistent with freezing—the thin layer of water quickly solidifies, and then matters proceed as before. Thus, at every instant, the strains at different parts of the mass melt it at those places where they are greatest, and so produce the extraordinary phenomenon of a mass which may in common language be termed *solid*, and even *rigid*, slowly creeping down its rocky bed like a stream of tar or treacle.

Ice-Trade and Manufacture.—The trade in ice is now one of great and increasing importance. Ice has always been esteemed as a luxury in warm weather; and this early led to the storing of it in winter and preserving it for summer use. The Greeks, and afterwards the Romans, at first preserved snow, closely packed in deep underground cellars. Nero, at a later period, established ice-houses in Rome, similar to those in use in most European countries up to the present time. But these means were not enough to supply the luxurious Romans with ice for cooling beverages, and they actually established

a trade in snow, which was brought to Rome from the summits of distant mountains.

The trade in ice in this country has, until lately, been very limited, having been chiefly confined to the supply required by a few of the first-class fish-mongers and confectioners—the private residences of the more opulent families being furnished with ice-houses in which a sufficiency is kept for private use. But the North Americans have started a trade in this article in their own cities, which has extended to Europe and Asia, and has, in an incredibly short space of time, attained a surprising magnitude. The export of ice from America was commenced about 1820, by a merchant named Tudor, who sent ice from Boston to the West Indies. After persevering against many losses, he succeeded in establishing a trade with Calcutta, Madras, and Bombay; and now not only is it sent in vast quantities to those places, but also to Hong-kong, Whampoa, and Batavia. About fifteen years since, the Wenham Lake Ice Company commenced sending ice to this country from Boston, which is the great American port for shipment of this material; and since then, not only has there been a continually increasing supply, but the success of the Company has been so great as to tempt others into the market, and many cargoes now annually come from Norway and Sweden.

In America the ice is chiefly collected in the neighbourhood of Boston, Philadelphia, Baltimore, Washington, and New York, and the lakes which supply it form no small part of the property of those whose lands border thereon; these have all been carefully marked out, and the right secured, so that, when the winter comes, and the ice is formed, the harvest begins with great regularity. The ice is cleared from snow by means of an implement called the plane. An ice-plough, drawn by horses, and driven by a man riding upon it, is then made to cut deep parallel grooves in the ice, and these are again crossed by other grooves at right angles, so that the whole of the surface is deeply marked out into small squares, measuring a little more than three feet. A few of these square blocks being detached by hand-saws, the remainder are easily broken off with crowbars, and floated away to the ice storehouses, which are usually built of wood, on the borders of the lake. Some of these are of vast dimensions, and contain vaults of great depth; the walls are double, and sometimes treble, being altogether as much as four feet in thickness, and having hollow spaces between to render them non-conductors. The blocks of ice are covered up with sawdust, a layer being placed between each tier of blocks. Many of these ice-houses are made large enough to hold from 40,000 to 50,000 tons of ice. When fully stored, a large quantity of dried marsh-grass is trodden in upon the top, to the thickness of several feet, and the doors are then securely closed. The domestic consumption of the United States in 1860 had reached very nearly one million tons, and the export trade exceeds 280,000 tons per annum, of which England takes, on an average, about 20,000 tons, costing £20,000. The total value of the ice which is stored in America has been computed at £900,000, and if to this we add the ice-trade of Norway, Sweden, Russia, which, from the slight data we possess, is estimated at £600,000, we have the astounding fact, that a value of one million and a half sterling is added to a comparatively small body of water by the mere act of freezing.

Notwithstanding the facilities for importing ice, there is, and always will be, a necessity for procuring it locally if possible. Hence there has been much talent brought to bear in devising means for

artificial freezing. See FREEZING MIXTURES. But until recently, the modes of producing ice artificially were too costly to be practically useful. The desideratum, however, may now be considered as supplied; for machines are constructed by Mr Siebe of Lambeth capable of producing ten tons per day. Such a machine requires steam-power to work it, and its action consists in evaporating ether or any similarly volatile liquid *in vacuo*, and again condensing the vapour to liquid, so as to be used afresh. By this machine, 20° F. below zero (52° of cold) has been easily obtained, and such a machine is now regularly producing large quantities of ice nearly under the equator in Peru, where previously ice had never been seen; and others are in use in India and at the Cape in the service of the government, for the use of the troops and hospitals. Another machine was shewn in the London Exhibition of 1862 by the French firm of Carré and Co., which, from its extreme simplicity, and the fact that it can be adapted to the humblest kitchen, seems to promise extensive application. The price is from £4 upwards; and as the volatile liquid is only the aqueous solution of ammonia, the cost of working it is very slight. It is believed that an increased demand is all that is required to enable ice to be produced by these machines at a cheaper rate than its transport from America. The machine-made ice has the same valuable quality that distinguishes the imported lake ice, viz., its perfect purity, so that pieces of it can be put into the drink that is to be cooled.

ICEBERG. See ICE.

ICE PLANT (*Mesembryanthemum* [q. v.] *crystallinum*), an annual herbaceous plant, a native of Africa and of the south of Europe, remarkable for the watery vesicles (*papule*) with which its whole surface is covered, and which have the appearance of granules of ice, and sparkle in the same manner in the sun. It is common as a tender annual in our green-houses, the peculiarity from which it derives its name making it an object of interest. The seeds are used for food in the Madeira Islands. The ashes supply barilla, and the plant is burned on this account in countries where it abounds.

ICELAND, an island in the northernmost part of the Atlantic, on the confines of the Arctic Ocean; in N. lat. 63° 23'–66° 33', and W. long. 13° 22'–24° 35', distant about 600 miles from Norway, and 250 from Greenland, 250 from the Farøe Isles, and above 500 from the north of Scotland. It belongs to the kingdom of Denmark. Its extent is about 39,207 square miles; its extreme length from east to west is upwards of 300 miles, its greatest breadth from north to south about 200. Its coasts, particularly on the north and west, are very much broken by bays or *fjords*. In some of the bays are numerous small islands. I. is in many respects one of the most interesting parts of the world. Its physical features are very remarkable, and not less so its history and the character of its inhabitants. It consists in great part of lofty mountains, many of which are active volcanoes; only certain level districts along the coasts, and a few dales, chiefly in the south, are habitable, or in any degree capable of cultivation, whilst even there scarcely a tree is to be seen, and the climate is unsuitable for grain. The interior of the island is almost entirely occupied with rugged tracts of naked lava and other volcanic products, vast ice-fields in many places connecting its high mountain summits, among which are prodigious glaciers, in some instances descending even to the coast, they and the torrents which gush from them rendering communication between one inhabited spot and another very difficult and dangerous.

Yet here has civilisation been long established, and the people, necessarily very poor, have cultivated poetry and other departments of literature with great success.

The highest mountain in the island is Oeräfa Jökul, which attains a height of 6426 feet above the level of the sea. It is situated in the south-east, and is connected with a vast mountain mass, of which several of the summits are actively volcanic, no less than 3000 square miles being perpetually covered with ice and snow at an elevation varying from 3000 to above 6000 feet, whilst all underneath seems to be full of either active or smouldering volcanic fire. The most celebrated volcano is Hecla (q. v.). Krafia is perhaps the most noted of a great group of active volcanoes in the north of the island. The eruptions of Hecla have caused no little devastation, but still more terrible and destructive have been those of Oeräfa Jökul and other volcanoes of the same mountain mass, which burst forth for the first time within the historic period in 1724. In repeated instances, volcanic islets have been thrown up in the bays and near the coasts of I., which have generally disappeared again within a short time. Connected with the volcanic fires are also hot springs in great number, some of which flow gently, and others, called *Geysers* (q. v.), gush up at intervals and with ebullitions of great violence. Numerous hot springs may in many places be seen sending up their steam in a single little valley, and the Icelanders are accustomed to avail themselves of them for the washing of clothes and other purposes. The water of some is merely lukewarm, whilst that of others is boiling; some are pure, and some sulphureous. They are subject to great variations, and appear and dry up very suddenly. Earthquakes are frequent, and the island suffered very severely from this cause in 1755 and 1783. The winter is not generally more severe than that of Denmark, although more protracted, and it is rather the shortness of the summer and the insufficiency of summer heat, with the superabundance of moisture, than the severity of the winter, which is unfavourable to the growth of corn and plants of many other kinds. In the southern portions of I., the longest day lasts 20 hours; the shortest, 4 hours. In the northern districts, the sun never sets for a whole week in midsummer, and in midwinter never rises above the horizon during an equally long period of time.

About 20,000 oxen, 30,000 or 40,000 horses, and 500,000 sheep constitute the chief part of the wealth of the inhabitants. The oxen are generally destitute of horns. The horses are small, but vigorous and active. They receive little attention from their owners, whose oxen require almost all the hay and other fodder they can store up for winter. I. ponies have now begun to be imported into Britain. Reindeer were introduced into I. by a public-spirited governor in 1770, and have become naturalised in the uninhabited tracts of the interior, where, however, their presence is of little importance. Seals abound on the coasts, where sea-fowls are also extremely numerous, and their flesh, eggs, and feathers are much sought after. Swans, and other *Anatide*, frequent the lakes. The Eider Duck is plentiful on many parts of the coast, and its down is a principal article of commerce. Fish of many kinds are abundant on the coasts, salmon and trout in the rivers. The food of the people consists in great part of fish. The cod-fishery is extensively prosecuted by the French, from two to three hundred French vessels and about 7000 seamen being employed in it, under the immediate patronage of the French government, which aims at thus training seamen for the navy. The salmon-fishery of some of the

rivers has begun to be prosecuted for the supply of the London market. The herring-fishery has not hitherto received special attention, but vast shoals of herrings frequent the fiords. The most important agricultural operations are those of the hay-harvest. The seeds of the *Melur*, or Upright Sea Lyme Grass (*Elymus arenarius*), are gathered and used for making pottage and cakes, and are esteemed as a luxury; bread made of imported grain being seldom seen in the houses of the common people. Meal made of Iceland Moss (q. v.) is used in a variety of ways, and this lichen is gathered in large quantities both for home use and for exportation. Potatoes, turnips, kale and cabbage, spinage, parsley, radishes, mustard, cresses, &c., are produced in gardens. The mineral wealth of I. has only begun to be developed. In no part of the world is sulphur found in such abundance. Iron ore is also found. There is a peculiar kind of brown coal called *Surturbrand* (q. v.), which, along with drift-wood, is much used for fuel on the northern and eastern coasts.

The population of I. was once 100,000, but it subsequently diminished. Since 1840, when it amounted to 57,094, a gradual increase has taken place, until in 1855 it had reached 64,603. The people, who are of Scandinavian origin, are distinguished for honesty, purity of morals, and a wonderful love of education. Notwithstanding their poverty and other adverse circumstances, it is rare to find an Icelander who cannot read and write. They belong to the Protestant Church. The clergy are, like their parishioners, very poor; they are under one bishop. The Icelanders are strongly attached to their native country, and delight in the study of its history as set forth in ancient *sagas* and poems. Their language is the old Norwegian, preserved in almost its pristine purity. See SCANDINAVIAN LANGUAGES AND LITERATURE. They are rather a small race, and seldom attain to a great age. Scurvy is a very common disease, and cases of elephantiasis are frequent, probably owing in a great measure to the nature of their food, and still more to their miserably crowded and unventilated dwellings, which are mostly cottages of the humblest description, built of turf or of pieces of lava, the crevices stuffed with moss, and the roof formed of turf. The knitting of stockings and gloves is a common kind of domestic industry, and with the sale of skins, wool, feathers, eider-down, fish-oil, &c., enables the peasantry to procure a few articles of foreign produce. The chief imports are rye, barley, flour, coffee, liquors, tobacco, sugar, coal, iron, &c. In 1855, upwards of 40,000 Danish barrels of grain (of all kinds) were imported; also about 427,000 lbs. of coffee, 448,000 quarts of various liquors, 109,000 lbs. of tobacco, 457,000 lbs. of sugar, and 32,000 chaldrons of coal. The annual exports are valued at 4,000,000 ryksdaler (£900,000), and consist of dried fish, wool, hosiery, tallow, train-oil, lard, and preserved meat. The destruction of meadows by volcanic eruptions, and the interruption of fishing by drift-ice, have sometimes caused great distress. Since 1855 free-trade has been in force; 32 authorised trading-places have been opened, of which Reikiavik, with a population of 1350, and situated at the head of a bay in the south-west of the island, is the most important. Here the governor resides; the *Althing* (from *Thing*, a public assembly), a kind of parliament, is held; here are a public library of 8000 volumes, a Royal Icelandic Society, and an Observatory. Three newspapers are published here, and Icelandic books are printed. There is regular steam-communication during summer with Leith and Copenhagen.

The authentic history of I. begins in the 8th c.,

when emigrants from Norway settled here. The Landnama Book, however, one of the earliest of the records of the island, states that the Christian relics found here by the Norwegians on their arrival—as wooden crosses, &c.—had been erected previously by Irish settlers. However this may be, it is certain that the first authentic successful settlement of I. was made under Ingolf, a Norwegian, who, after a fruitless attempt on the south coast in 870, succeeded in establishing himself at Reikiavik in 874. The changes introduced in Norway by Harald Haarfager caused many who could not endure them to betake themselves to other countries, and particularly to I., all the habitable coast districts of which were occupied within sixty years, and the old Norwegian institutions were transferred to it unmodified. The government was at first, in the times of paganism, hierarchic and aristocratic; it became afterwards a kind of aristocratic republic. The Althing met every summer in the valley of Thingvall. Christianity was not established by law till 1000 A.D., and then not without much opposition. Schools were then founded, and two bishoprics in Holar and Skalholt.

The Icelanders were enterprising sailors in the early periods of their history, and discovered Greenland about the year 932, and a part of the American coast, which they called *Vineland*, about 986. They made voyages also to the south, visiting the furthest parts of the Mediterranean. The most flourishing period of Icelandic literature and commerce was from the middle of the 12th to the beginning of the 13th c., when, in consequence of domestic broils, Haco VI. of Norway succeeded in reducing the whole island under his sway, and a declension began, which continued till a new impulse was given to the minds of men, here as elsewhere, by the Reformation. When Norway was united to Denmark in 1380, I. shared its fate, but was not transferred along with Norway to a new allegiance in 1814. The Protestant religion was introduced in 1540, but not fully established till 1551. In the 17th c., the island suffered much from the ravages of Algerine pirates, who carried away many persons to slavery. In 1707, small-pox carried off 18,000 persons; and in 1784—1785, about 9000 died of famine. Famine was again very severe in 1824 and 1825, and was followed by a fatal epidemic in 1827.—The Althing, after it had subsisted for fully 900 years, was suppressed in the beginning of the 19th c., but was reorganised on a somewhat different model in 1843.—See Von Troil, *Letters on Iceland*, 1772; Sir George Mackenzie, *Travels in Iceland*, 1810 (cheap edition by W. and R. Chambers, 1851); Henderson, *Journal of a Residence in Iceland*, 1818; R. Chambers, *Tracings of Iceland and the Farøe Islands*, 1856; C. S. Forbes, *Iceland, its Volcanoes, Geysers, and Glaciers*, 1860.

ICELAND MOSS (*Cetraria Islandica*), a lichen found in all the northern parts of the world, and valuable on account of its nutritious and medicinal properties. It is collected as an article of commerce in Norway and Iceland. In very northern regions, it grows even near the level of the sea; in more southern countries, it is found on mountains. It is not uncommon in the mountainous parts of Britain, although not turned to any economic account. In Carniola, it is used for fattening cattle and pigs. It grows in extreme abundance in Iceland on tracts otherwise desert; and numerous parties migrate from great distances with horses, tents, and provisions, in the summer months, for the sole purpose of gathering it, as an article of commerce, and for food. In many places, this lichen thickly covers the whole surface of the ground, growing about 1½—4 inches high; and

consisting of an almost erect *Thallus* (q. v.). It is of a leathery and somewhat cartilaginous substance. When I. M. is used as an article of food, its bitterness is first partially removed by steeping in water, after which, in Iceland and other northern countries,

Iceland Moss (*Cetraria Islandica*).

it is sometimes pounded and made into bread; or it is prepared by boiling, the first water being rejected. It is often boiled with milk, making a kind of jelly, either with milk or water. It is an agreeable article of food, and very suitable for invalids. It contains about 80 per cent. of a kind of starch called *Lichen Starch*, or *Lichenin*, and owes its bitterness to an acid principle, *Cetraric Acid*.—An allied species, *Cetraria nivalis*, growing in northern countries, possesses similar properties. It is very abundant in some parts of Iceland, is much used for food, and is called *Mary's Grass* by the Icelanders.

ICHNEUMON (*Herpestes*), a genus of digitigrade carnivorous quadrupeds of the family *Viverridae* (q. v.), having a much elongated body, small head, sharp muzzle, rounded ears, and short legs. The species, which are pretty numerous, are natives of Africa and the warmer parts of Asia. One, the **ANDALUSIAN I.** (*H. Widdringtonii*), occurs in the south of Spain. They feed on small quadrupeds,

Egyptian Ichneumon (*Herpestes Ichneumon*).

reptiles, eggs, and insects. Some of them, particularly the **EGYPTIAN I.** (*H. Ichneumon*) and the **MANGOSTE** or **MUNGUS** (*H. griseus*) of India, have been greatly celebrated as destroyers of serpents and other noxious reptiles, many wonderful fables being superadded to the truth on this subject. The Egyptian I., the I. of the ancients, is larger than a cat, gray, with black paws and muzzle, and a black tuft of diverging hairs at the end of the tail. It abounds in Lower Egypt, but in Upper Egypt it is comparatively rare. It often enters houses, and devours poultry and their eggs. With noiseless gliding motion it advances on serpents until it can suddenly

seize them behind the head, where its long sharp teeth inflict a fatal wound. It scratches up the sand for the eggs of crocodiles, which it eats with great avidity. It was a sacred animal among the ancient Egyptians; the killing of it was forbidden; and individuals, for the maintenance of which funds were set apart, were objects of worship. The I. is easily domesticated, and forms a cat-like attachment to the place of its residence. It is useful in keeping houses free of rats and other vermin. It is therefore not unfrequently domesticated in Egypt, as the mangouste also is in India. This species is rather smaller, of a lighter colour, and has a pointed tail.

ICHNEUMON, a Linnæan genus of insects, now constituting a family or tribe, *Ichneumonidae*, of the order *Hymenoptera*, section *Terebrantia*. The *Ichneumonidae* are extremely numerous. Gravenhorst's *Ichneumonologia Europæa* describes nearly 1650 European species, and they are equally abundant in other parts of the world. Many of them are minute, others are large insects; a few of the tropical species are amongst the largest of insects. They have the abdomen united to the thorax by a pedicel, which is often very slender. The abdomen itself is slender, and the whole form attenuated. The antennæ are generally thread-like, composed of a great number of joints, and are kept in very constant vibration. The ovipositor in some is short; in some it is very long, much longer than the body of the insect, and enclosed in a kind of sheath formed of two parts, concave on their inner surface, from which it is disengaged when about to be used, the whole then often seeming as three threads proceeding from the extremity of the abdomen. All the *Ichneumonidae* deposit their eggs either in or on—generally in—the bodies, eggs, or larvæ of insects, or in spiders. Some of them deposit their eggs in aphides. They are thus extremely useful to the farmer and gardener. Particular species of *Ichneumonidae* are the natural enemies of particular kinds of other insects. Thus, *Microgaster glomeratus* and *Pimpla instigator* lay their eggs in the caterpillars of the cabbage butterfly. Some species deposit only one egg in the egg or larva which is destined to afford food to their own larva; others deposit a number of eggs together. Those which have a long ovipositor use it to reach eggs or larvæ under the bark of trees, in holes of wood, &c. The I. larvæ generally consume only the fat of the larva on which they feed, which continues to subsist and so to sustain them till they are ready for transformation into pupæ. In their perfect state, the *Ichneumonidae* feed only on the juices of flowers. They are very often to be seen flying about umbelliferous flowers. The I. larvæ are without feet. The pupæ of many are enclosed in silken cocoons.

ICHOLOGY (Gr. science of footprints) is the name given to that section of Palæontology which treats of the impressions made on mud or sand, now indurated into rock, by the animals of the period to which the rocks belong, or by meteoric or other transitory physical forces. The actual remains of the hard portions of the animals themselves are the materials on which chiefly rests our knowledge of the former inhabitants of the globe; but of many animals we know nothing more than the more or less distinct impressions made by them as they moved over the surface of a muddy shore. And in some beds, not only is the evidence of the shore-wave preserved in the ripple-mark, and the influence of the sun's heat exhibited in the superficial cracks, but frequently the passing hail-storm, or the sudden and heavy thunder-shower, has left its impress upon them, and this so perfectly, that it is not difficult to

determine, from the form of the cup-like depression, whether or not the rain was accompanied by a breeze, for, by observing the amount of difference in the sides of the cup, and the position of the highest side, the direction of the gale and its velocity may be approximately determined. Though the force or body forming the impression has been removed immediately after it has made the pressure, yet in these prints the evidences of animal life and of the activity of physical forces, have come down to us from the remotest periods.

The impressions occur almost invariably on rocks that have been deposited as mud; only in a few cases have they been noticed in sandstone. Sometimes the argillaceous deposit is a thin layer between two sandstone beds; it is then difficult to obtain a clear surface in the shale; but the details are carefully preserved in relief in the natural cast on the under surface of the superimposed sandstone. In this manner the footprints are preserved at Stourton in Cheshire.

The necessary conditions for the preservation of footprints seem to be either of the following. The silt-bed may have formed an extensive flat shore, uncovered by the tide at each ebbing. Whatever impressions were made on this plastic surface would be baked and hardened by the influence of the sun, if it remained for a sufficient time uncovered by the water; and when the tide again flowed, the hardened mud, resisting its influence, would receive another film of sediment, which would specially deposit itself in the depressions, and thus secure the permanence of the impressions. These influences would operate more powerfully on portions of the shore which were under water only at spring-tides. The impressions of numerous wading birds are preserved in this manner at the present day, on the plastic mud which covers the flat shore of the Bay of Fundy, where the tide rises, it is said, as much as 70 feet. Both Gould and Lyell have given detailed accounts of the process as it goes on there. The other method is one independent of the sun's influence, where, on an ordinary muddy shore during the recession of the tide, the depressions are filled up by blown sand, and the tide, on its return, flows over a level surface, on which it deposits a fresh layer of silt.

The study of ichnology carries us back to the remotest known period of animal life on the globe. The deposit from which has been obtained the fragment of the oldest known trilobite (Palæopyge), contains the borings of certain worms (fig. 1) and

Fig. 1.—Annelid Borings (*Arcticolites*):
From Cambrian Rocks.

impressions of rain-drops. In strata of the same period, but a little later, series of regularly recurring groups of markings are considered by Mr Salter as having been produced by the sharp claws of crustacea in walking; while other sets he refers, with considerable show of probability, to the strokes of the bifurcate tail of an unknown crustacean as it swam through shallow water. From the American representatives of the same rocks (Potsdam sandstones), Professor Owen has described a number of impressions made apparently by different animals, to which he has given the generic name of *Protichnites*. The slabs shew that the animals

made at each step 14, 16, or more impressions. They were most probably crustacea, furnished with three or four pairs of bifurcating limbs, like the modern king-crab. Similar impressions have been observed in the Lower Silurian rocks of Eskdale in Scotland, and have been named *P. Scoticus*. The tracks of numerous annelids occur also in these rocks. They

Fig. 2.—*Nereites Cambrensis* :
From the Lower Silurian Shales of Moffat.

exhibit the impressions of the creatures as they moved along, or sometimes through, the soft mud, and they frequently terminate in a distinct impression of the form of the worm itself, produced perhaps by the dead body, although no trace of the body itself is preserved (fig. 2).

The footprints of a small reptile had been observed on the sandstone of a quarry near Elgin, which most probably belongs to the Old Red Sandstone Measures. In 1851, it was discovered that they were produced by a little reptile (*Telerpeton Elginense*), whose remains were there found. And lately, Professor Huxley has referred a different set of impressions to his lately described remarkable fish-like reptile, *Stagonolepis*.

The Coal Measures of our own country and of Germany have disclosed the footprints of different reptiles.

The New Red Sandstone strata abound in footprints. It was the Permian or lower division of this series that supplied, in 1828, the impressions which gave the first indication of animal life from such evidences to the mind of Dr Duncan—a man who deserves to be remembered less for his works in natural history, important though they were, than for his eminent services to his country as the founder of savings-banks. The tracks he described occur on the layers of unctuous clay which separate the beds of sandstone in the quarries at Corncockle, Dumfriesshire; they frequently are clear and delicate, as at the moment when they were impressed, and

Fig. 3.—Footprints of a Tortoise :
From the Permian Sandstone of Annandale.

are repeated bed after bed on the fresh tablets as they were prepared for their reception. From their number and direction, they seem to be the tracks

of animals passing together across a tide-receded estuary, to some frequented ground periodically sought for food or pleasure. No animal remains whatever have been found associated with them; they seem, however, to belong to forms of tortoise. The slab figured is a portion of the track probably of a long-tailed Chelonian, with a stride a little over six inches. The pad of the foot was soft and smooth; the light impressions of the fore-foot were nearly obliterated by the hind-foot, which was furnished with four claws (fig. 3). Sir William Jardine, on whose property the Corncockle quarries are, has made these tracks the subject of a valuable and elaborate monograph.

In the Triassic rocks, the well-known foot-tracks of the *Labyrinthodon* (q. v.) occur.

The earliest evidence of the existence of birds are the traces of their feet in the argillaceous sandstones of Connecticut, which are now known to be of the Lower Oolitic age. The

structure of the tridactyle feet which produced these impressions exhibits the regular progression in the number of the toe-joints from the innermost to the outermost toe peculiar to birds, and they must be taken as evidencing the occurrence thus early of the class, although a considerable interval elapses before the first true fossil of a bird occurs; namely, the remarkable long-tailed bird from the Upper Oolite rocks of Solenhofen, recently described by Professor Owen. Immense tridactyle footprints have been known for many years in rocks of Wealden age in the south-east of England. At first, they were supposed to be birds; but a more careful examination has shewn them to belong to reptiles; and the discovery in the same strata of the perfect foot of a young *Iguanodon*, measuring 21 inches in length, and furnished with three toes, which would form a print precisely similar to the tracks so long known, shews them to have been certainly produced by the *Iguanodon* (q. v.).

Fig. 4.—Footprints of Birds :
On the Oolitic Sandstones of
Connecticut.

ICHTHYODORULITE (Gr. fish-spear-stone), the name given to fossil fish spines, that are not uncommon in the stratified rocks. Plagiostomous fishes have their dorsal fin furnished in front with a strong bony spine. The fin is connected with the spine, and is elevated and depressed by its movement. It seems also to be employed by the fish as a defence against its larger foes. Some bony fishes have similar spines, as the Sticklebacks, Silurids, &c. The spines are most frequently unassociated with any fish remains, having belonged to plagiostomous fish, in which the spine is simply implanted in the flesh, and consequently would be speedily separated from the body of the fish when it began to decompose.

The earliest certain evidence of vertebrate animals is the spines of plagiostomous cartilaginous fishes which occur in the bone bed of the Ludlow rocks, the uppermost of the Silurian deposits. Spines belonging apparently to three species have been found; they are small, compressed, slightly curved,

and finely grooved lengthwise, and belong to the genus *Onchus*. Along with them have been found petrified portions of tubercular and prickly skin, like the shagreen of the shark.

The Old Red Sandstone has supplied such a variety of spines as to have afforded the materials for establishing fourteen genera, and in the Coal Measures they are more numerous, belonging to no less than twenty-one genera.

ICHTHYOLOGY (Gr. *ichthys*, a fish; *logos*, a discourse), that branch of natural history which treats of fishes. Aristotle is the most ancient author having any claim to be noticed in a history of ichthyology, nor was this science much indebted to any other of the ancients. In modern times, it began to be cultivated, about the middle of the 16th c., by Belon, Rondelet, and Salviani. Towards the close of the 17th c., it made great progress through the labours of Willoughby and Ray; in the 18th c., through those of Artedi, Klein, Linné, Gronow, Brunich, Scopoli, and Bloch; in the beginning of the 19th c., through those of Cuvier and De la Cépède; whilst, more recently, Valenciennes, Müller, Agassiz, and Owen are eminent amongst many who have prosecuted the study of ichthyology with ardour and success. The name of Yarrell deserves to be particularly mentioned for his work on British Fishes. The earlier ichthyologists generally included the *Cetacea* among fishes. Linné removed the *Cetacea* to their proper place. He also placed the *Cartilaginous Fishes* with Reptiles in his class *Amphibia*, from which they have since been,

by the common consent of naturalists, brought back to their place in the class of Fishes. Linné's system of ichthyology is almost as artificial as his system of botany. It is founded on the relative positions of the pectoral and ventral fins, without reference to any important point of comparative anatomy or animal economy. Other ichthyologists, both before and since, have laboured to discover a natural arrangement, to which the progress of comparative anatomy has greatly contributed, although success is still confessedly very imperfect. Even the system of Agassiz, founded on the external covering of fishes, is not wholly artificial, and is of very convenient application to fossil ichthyology.

ICHTHYOSAURUS (Gr. fish-reptile), a remarkable genus of reptiles which inhabited the sea during the deposition of the Secondary strata. Like the modern *Cetacea*, their structure was modified to suit their aquatic life. The body was shaped like that of a fish, the limbs were developed into paddles, and the tail, long and lizard-like, was furnished, it is believed, with a fleshy fin, as in the dolphin, except that its position was vertical. The head was large, and produced into a long and pointed snout, resembling that of the crocodile, except that the orbit was much larger, and had the nostril placed close to it, as in the whale, and not near the end of the snout. The jaws were furnished with a large series of powerful conical teeth, lodged close together in a continuous groove, in which the divisions for sockets, which exist in the crocodile, were indicated by the vertical ridges on the maxillary bone.

Ichthyosaurus.

The teeth were hollow at the root, sheathing the young teeth, which gradually absorbed the base of the older ones, and, as they grew, pressed them forward, until they finally displaced them. The long and slender jaws were strengthened to resist any sudden shock by being formed of many thin bony plates, which produced light and elastic as well as strong jaws. The most remarkable feature in the head was the eye, which was not only very large—in some specimens measuring 13 inches in diameter—but was specially fitted to accommodate itself for vision in air or water, as well as for speedily altering the focal distance while pursuing its prey. The structure, which thus fitted the eye so remarkably to the wants of the animal, consists of a circle of 13 or more overlapping sclerotic bony plates surrounding the pupil, as in birds. This circle acted as a sort of self-adjusting telescope, and accompanied by the extraordinary amount of light admitted by the large pupil, enabled the ichthyosaurus to discover its prey at great or little distances in the obscurity of the night, and in the depths of the sea. The neck was so short that the body was probably not in the least constricted behind the head. The backbone was fish-like; each joint had both its surfaces hollow, making the whole column very flexible. The small size of the paddles compared with the body, and the stiffness of the short neck, seem to suggest that the tail must have been an important organ of motion.

Professor Owen is satisfied that it was furnished with a vertical tail, because the vertebrae are compressed vertically, and also because the tail is frequently found disarticulated a short distance from its extremity, as if the weight of the upright tail had caused it to fall when the animal had begun to decompose. The fish-like body, the four paddles, and especially the powerful tail, would make the ichthyosauri active in their movements; and consequently, with their predaceous habits, very dangerous enemies to the other animals that inhabited with them the Secondary seas. That their principal food consisted of fishes, is evident from the masses of broken bones and scales of contemporary fishes that have been found under their ribs in the place where the stomach of the animal was situated.

The remains of ichthyosauri are peculiar to the Secondary strata, occurring in the various members of the series from the Lower Lias to the Chalk, but having their greatest development in the Lias and Oolite. More than 30 species have been discovered; they differ from each other chiefly in the form of the head, some having a long and slender snout, like the gavia of the Ganges, while others had short and broad heads, more like the common crocodile.

The great repository for ichthyosaurian remains hitherto has been the Lias at Lyme Regis.

ICHTHYOSIS, or **FISH-SKIN DISEASE**, is characterised by a hardened, thickened, rough, and almost horny state of the cuticle, which breaks

into small, irregular, scale-like pieces, which do not readily exfoliate, but which, if removed, are speedily reproduced. The disease may affect almost the whole surface, or may be confined to a single part; and is most frequently, but not always, congenital. It is attended with no constitutional disturbance, and the general health is often very good. The disease is, however, extremely obstinate, and when congenital, may be considered as incurable.

The treatment consists in the frequent use of the warm or vapour bath, so as to soften the thickened epidermis and to facilitate its removal, and friction by means of a piece of flannel may be conjoined with the bath. The employment of sulphureous baths, such as those at Harrogate, has occasionally been found of temporary use; and the internal administration of tar, cod-liver oil, &c., sometimes gives relief.

ICICLES, in Heraldry, are charges of the same shape as drops in the bearing called Gutté (q. v.), but reversed. They have also been called Clubs, Locks of Hair, and Guttés reversed.

ICILIUS, the name of a plebeian family in Rome, which produced some of the most zealous defenders of the plebeian interest against the patricians. The name of one of them is associated with one of the most touching incidents in the legendary history of Rome. See **APPIUS CLAUDIUS**.

ICO'D, or **ICOD DE LOS VINOS**, a small town on the north-west coast of Tenerife, one of the Canaries (q. v.). Pop. upwards of 5000.

ICOLMKILL. See **IONA**.

ICONIUM. See **KONIEH**.

ICONOCLASTS (Gr. *eikon*, image, and *klazo*, I break), the name used to designate those in the church, from the 8th c. downwards, who have been opposed to the use of sacred images;—that is, of statues, pictures, and other sensible representations of sacred objects;—or at least to the paying of religious honour or reverence to such representations. The iconoclast movement had its commencement in the Eastern Church. Opinion is divided as to the origin and antiquity of the practice of Image-worship (q. v.) in the church; but it is certain that in the 6th and 7th centuries it prevailed extensively, especially in the Eastern Empire, and that practices existed in some churches which were a source of much suspicion, and even of positive offence. Many bishops interposed to correct these abuses; but the iconoclast movement, strictly so called, began with the imperial edict issued in 726 by the Emperor Leo III., surnamed the Isaurian, forbidding the honours paid to sacred images, and even commanding the removal from the churches of all images, that of our Lord alone excepted. This was followed by another decree in 730, which prohibited, under pain of death, as sinful and idolatrous, all acts of reverence, public or private, to images, and directed that, wherever such images should be found, they should forthwith be removed or destroyed. The attempt to enforce this decree occasioned great agitation, especially in the Greek islands and in Italy. The popes Gregory II. and Gregory III. protested vehemently against it, repudiating the imputation of idolatry, and explained the nature of the honours to images for which they contended. Leo persevered, nevertheless, in his opposition, which was continued by his successor, Constantine, surnamed Copronymus. Under this emperor, a council was held in Constantinople in 754, in which the iconoclast decrees were affirmed in their fullest extent; and Constantine's son, Leo IV., renewed, on his accession in 773, the

enactments of his predecessors. Under the widow of Leo, the Empress Irene, a council was held at Nice, 786 (see **IMAGE-WORSHIP**), in which these proceedings were condemned and revoked; but other succeeding emperors, Nicephorus (802—811), Leo the Armenian (813—820), Michael the Stammerer, and Theophilus, returned, with greater or less severity, to the policy of the iconoclast emperors. As regards the Greek Church, the controversy may be said to have been finally settled under the Empress Theodora in a council held at Constantinople in 840, or at least by a subsequent one of 870. The modern usage of the Greek Church permits pictures, but rejects graven or sculptured representations of sacred objects. Except in Italy, the iconoclast controversy created but little sensation in the Western Church until the movement in the time of Charlemagne and his successors, which shall be noticed under **IMAGE-WORSHIP**.

In the modern church, the popular violences directed in Switzerland, Great Britain, and some parts of Germany, against crucifixes, images of saints, and other objects associated with what has been stigmatised as the idolatry of Rome, have sometimes been described under the name of Iconoclasm.

ICY CAPE, a headland of Russian America, is in the 71st degree of north latitude, about the middle of that long reach of the arctic coast between Cape Lisburne on the south-west, and Cape North or Point Barrow on the north-east. It was discovered by Cook in 1778, and was his furthest point north of Behring's Strait.

IDA, a high mountain range, in Asia Minor, extending from Phrygia through Mysia into Troas. The city of Troy was situated at its base. It is the scene of many ancient legends. The southern part of the range was called Gargarus, the highest peak of which is about 4700 feet above the sea. Here there was a temple of Cybele, who therefore was called the *Idæan Mother*. From Ida flow several famous streams, as the Granicus, Simois, and Scamander.—There is another Ida in Crete, extending from west to east, and now called Psiloriti. On this Ida, according to an ancient legend, Zeus was educated.

IDE (*Leuciscus Idus*), a fish of the family *Cyprinidæ*, of the same genus with the roach, dace,

Ide (Leuciscus Idus).

chub, &c. It is a native of the lakes of the northern parts of Europe, ascending rivers in April and May to spawn. The ide is one of those fishes which it seems both easy and desirable to introduce into British waters.

IDEA. This word has borne very distinct meanings in the history of philosophy. Down to the 17th c., it had the signification given to it by Plato, and referred to the Platonic doctrine of eternal forms existing in the Divine mind, according to which the world and all sensible things were framed. Plato made a great distinction between

the *intelligible*, or what occupied the intellect, and the *sensible*; the one represented the eternal, the immutable, and the certain; the other, the mutable and fleeting part of the universe. The forms preceded the matter; the actual circles occurring in nature were produced from a pre-existing ideal circle holding a place in the Divine intelligence; the actual men were generated from an ideal man. The word was used in this sense in literature as well as in philosophy down to the 17th c., as in Spenser, Shakspeare, Hooker, and Milton. Thus in *Paradise Lost*—

‘God saw his works were good,
Answering his fair *idea*.’

Sir W. Hamilton dates the change that came over the application of the word from the publication of Descartes's *Discourse on Method* in 1637, remarking, however, that in a treatise by David Buchanan, published at Paris the year before, the new meaning had been introduced. ‘The fortune of this word is curious. Employed by Plato to express the real forms of the intelligible world, in lofty contrast to the unreal images of the sensible, it was lowered by Descartes, who extended it to the objects of our consciousness in general. When, after Gassendi, the school of Condillac had analysed our highest faculties into our lowest, the *idea* was still more deeply degraded from its high original. Like a fallen angel, it was relegated from the sphere of Divine intelligence to the atmosphere of human sense; till at last *Ideologie* (more correctly *Idealogie*), a word which could only *properly* suggest an *à priori* scheme, deducing our knowledge from the intellect, has in France become the name peculiarly distinctive of that philosophy of mind which exclusively derives our knowledge from the senses.’—Hamilton's *Discussions*, p. 70.

In speaking of the mental representation of external things, Descartes, instead of employing the various terms *image*, *species*, *phantasm*, &c., which had been the words formerly in use for that particular signification, used the word *idea*. In this he was followed by other philosophers, as, for example, Locke, who states that he has adopted the word to stand for ‘whatever is the object of the understanding, when a man thinks.’ Thus the mental impression that we are supposed to have when thinking of the sun without seeing the actual object, is called our *idea* of the sun. The *idea* is thus in contrast with the sensation, or the feeling that we have when the senses are engaged directly or immediately upon the thing itself. The sensation is what constitutes the *thing*, the reality: the impression persisting after the thing has gone, and recoverable by mental causes without the original, is the *idea*. Although the word in this application may be so guarded as to lead to no bad consequences, Dr Reid was of opinion that it gave countenance to the setting up of a new and fictitious element in the operations of the mind. This, however, raises the great question of metaphysics—namely, the exact nature of our knowledge of an external world. See PERCEPTION.

It is difficult to avoid the use of the word *idea*, and yet, owing to the looseness of its application, there is a danger of its not conveying a definite signification. We need a general word to express the contrast to sensation, or to actuality; and no better term has yet been found than *idea*, being what is common to memory and to imagination, and expressing the mind as not under the present impression of real objects, but as, by its own tenacity and associating powers, having those objects to all practical ends before its view. Thus, all our sensations, whether of sight, hearing, touch, taste, or smell, and all the feelings that we have in the

exercise of our moving energies, become transformed into ideas when, without the real presence of the original agency, we can deal with them in the way of pursuit or avoidance, or can discriminate and compare them, nearly as if in their first condition as sensation. Sir W. Hamilton, in his *Lectures on Logic* (i. 126), has endeavoured to avoid employing the word, but other writers on mental philosophy have freely adopted it in the above acceptance. See also GENERALISATION and IMAGINATION.

IDELER, CHRISTIAN LUDWIG, an eminent astronomer and chronologist, was born 21st September 1766, at Gross-Brese near Perleberg in Prussia, and, after holding various offices, received a professorship at the university of Berlin in 1821. He died August 10, 1846. I.'s most important works are, *Historische Untersuchungen über die Astronomischen Beobachtungen der Alten* (Leip. 1806); *Untersuchung über den Ursprung und die Bedeutung der Sternnamen* (Berlin, 1809); *Handbuch der Mathematischen und Technischen Chronologie* (2 vols. Berlin, 1825—1826), the last of which was the first work that presented a clear view of the reckoning of time among the ancients; and *Die Zeitrechnung der Chinesen* (Berlin, 1839).

IDEM SO'NANS, a term sometimes used in English law, where a mistake as to a surname is made in a legal document, to denote that the name used by mistake was of a similar sound, in which case the mistake is generally treated as immaterial.

IDENTITY of person in point of law must often be proved in legal proceedings, as in proving a marriage, proving a pedigree, proving a thief, &c. The usual proof is the oath of some one who knew or was cognizant of the facts at both the times referred to. A favourite defence of thieves and persons accused of crime is, that it is a case of mistaken identity, in which case the prisoner must generally establish an *alibi*—i. e., that he was in some other place at the time in question.

IDENTITY, CONTRADICTION, AND EXCLUDED MIDDLE. It has been common to look upon some truths as necessary, in opposition to others that, although certain to all intents and purposes, are not necessary, but *contingent*. Thus, it is considered a necessary truth, that two straight lines cannot enclose a space; that the less cannot include the greater; that a man cannot be in two places at the same time. On the other hand, it is not necessary that gold should be yellow, or water transparent: these facts, we conceive, might have been otherwise arranged. There has been much controversy as to this character of necessity that distinguishes some of our beliefs from others. See NECESSITY. The schoolmen laid down three principles, involving what they considered the widest generalisations of our necessary beliefs: these are the laws of Identity, Contradiction, and Excluded Middle.

The law of Identity is expressed thus: ‘Whatever is, is;’ a proposition justly considered as irresistible. If any objection lies against it, it is, that nothing appears to be got by affirming it. When we say that ‘Water freezes at 32°,’ there is a piece of new information conveyed; by merely knowing water in its liquid state, we should not know that at 32° it became solid; the affirmation is something real. But when we say that ‘Water is water,’ there is the form of information, but nothing is conveyed; the proposition belongs to the class termed ‘identical.’ We merely re-affirm what is already affirmed. The law of identity can only mean that we are to adhere to the meaning of a word as once given; that is to say, we should be consistent

in the use of terms. It is a law, not of things, but of the employment of language to denote things.

The law of Contradiction is, that 'the same attribute cannot be both affirmed and denied of the same subject;' or that a thing cannot be and not be at the same time. In other words, two affirmations that contradict each other cannot be both true. We cannot say both that the 'Sun has risen,' and the 'Sun has not risen;' 'Gold is heavy,' and 'Gold is not heavy.' Here, also, one might suggest the remark, that the proposition is an identical one; for the use of the word 'not' can only mean that the proposition to which it is coupled cannot be held along with the proposition to which it is not coupled. That if the affirmative be true the negative must be false, and if the negative be true the affirmative must be false, are but the same thing differently expressed. The word 'not' is an abbreviation for what would otherwise be a more roundabout expression. Instead of saying: 'I disbelieve, and deny that gold is white,' we say: 'Gold is *not* white.' So far, therefore, the principle of contradiction, like that of identity, is not a law of things, but of the use of language; implying simply, that when we have affirmed a fact in one form of words, we must, in varying our terms, adhere to the same affirmation.

But this remark does not exhaust the scope of the principle. It has already been observed (see *CONDITIONED*), that our knowledge can never be confined to one absolute property; in other words, to know a thing, we must know something different from it. We cannot even be conscious of one unvarying impression; animals that live in total darkness are not conscious of the darkness, they would become so only in passing into light. It is true that we are constantly in the habit of mentioning a single property, and leaving out of account the related fact but for which the first would have no existence; we may talk of light without alluding to darkness. But it is not the less certain that the alternative circumstance, for the time suppressed, is a real part of the case; and there are many occasions, when our meaning cannot be fully imparted without actually quoting the alternative; and to be logically or formally complete, we ought at all times to state the two.

There are many qualities the very mention of which brings vividly before the mind an opposed couple: as, up, down; straight, crooked; desire, aversion; &c. But beyond these cases, it is a tenable assertion that every fact or property recognised by the human mind must be recognised with relation to some other fact or property, its contrast or opposite, but for which as an alternative, the mind would not have that opportunity of *transition* essential to consciousness itself. Take *redness*, which does not suggest to the mind an opposite in the same manifest form as in the above instances. If all light were red, there would be no designation of redness; the only terms would be light and dark. But as there are varieties of light, that is, as we experience mental shocks or impressions by transitions occurring under the luminous agency, we are made alive to subordinate differences, which we mark as so many distinct properties. When white and red are presented to the eye in succession, there is imparted a shock of difference, developing an item of knowledge, which, to be fully expressed, would be 'white-red.' White would then mean the opposite of red, and red the opposite of white; to the affirmation, 'Snow is white,' there would correspond as an essential and inseparable part of the same fact, 'Snow is not red.' But as there are a great many transitions of colour that make the mind sensible to difference, the mention of one colour is attended

with, not one simple denial, but many denials. We have red-green, red-yellow, red-blue, &c.; and, moreover, when these couples pass in succession before the view, we are further struck with the fact of *agreement* in the common effect 'redness.' Thus, the fact or property, 'redness,' is the name for the common element in certain couples, which element it affirms, while denying in each case the contrasting element; it is not-white, not-green, not-yellow, not-blue, and not every other colour, which placed side by side with it made the mind alive to difference. When, by differences and agreements as now described, a class of colours is constituted, the mention of one is the denial of every other member of the class; and the denial of one is the mention of some other or others, provided we are keeping our attention confined to that class. Professor de Morgan has introduced into logic the phrase 'universe of the proposition,' to intimate the class of objects implied when an affirmation, with its corresponding denial, is given forth. Thus, 'Such a thing is red,' implies as the universe of the proposition the class of colours; 'A rose smells sweet' is in the universe 'odours.'

Many other examples might be quoted in illustration of the general principle, and also to shew that, in the case of ambiguity or uncertainty in the meaning of a positive term, the proper remedy is to demand an explicit statement of the quality, or qualities, denied. Thus, if a thing is spoken of as 'beautiful,' which contrast is intended? for there are several implied in the name. Is it 'beautiful, not ugly or deformed,' 'not indifferent or insipid,' 'not sublime?' &c. The important function of *defining* terms is thus, in the last resort, to bring into open statement, what is usually left in the form of a tacit understanding, the denial corresponding to each affirmation. See also *CONDITIONED*.

The principle of Excluded Middle is another form of the principle of Contradiction, implying the same general fact, and resting on the same foundation. It is, that of two contradictories, both cannot be false, or one must be true. Any given assertion must be *either* true or false; either the affirmative is true, or otherwise the negative is true, which means that the affirmative is false. 'This house is either mine or not mine;' 'Gold is yellow, gold is not yellow,' cannot be both false, one must be true. There is no *middle course* in such an alternative. But on examination, it will appear that this principle does not hold in the same unqualified sense as the principle of contradiction; for the attribute affirmed or denied must be something intelligible and definite, as well as relevant to the subject in hand. We often say such a thing is neither big nor little, implying that there is a certain mean point that excludes the extremes, and yet those two terms are the negative of each other. In a word, it is an essential condition of the principle that the universe of the proposition should be distinctly understood and kept in view. If we say 'this is either red or not red,' the alternative is indisputable within the universe 'colour,' but not otherwise; the taste of an orange is neither red nor not red: if we jump over the boundaries of the class, the principle no longer holds good.

The three principles of Identity, Contradiction, and Excluded Middle, are usually talked of as necessities of the human mind, from which there is no escape. But we have just seen that in the case of the Excluded Middle, there are possible evasions; and even the principle of contradiction itself is flatly met by Hegel, who lays it down as a maxim of his philosophy that 'being' and 'not being' are the same, and deduces important inferences therefrom. All this should make us cautious in declaring

any formula or any doctrine to be absolutely necessary, or imperative on the human mind.

IDES. See CALEND.

IDIOCY is the non-development of the mental faculties. A dement is deprived of powers which he once possessed; an idiot never, or only imperfectly, possesses such powers. In certain cases, the human form appears scarcely to be animated by intelligence at all; it is a senseless, motionless mass, to which the special senses impart no intimation of an external world, and from which there emanate no manifestations of human love or passion, or perception. The degrees of deprivation are, however, very numerous and sharply defined, so as to suggest different modes of management and training, and different degrees of moral responsibility in the individuals. The general characteristics of the vast majority of idiots may be held to be diminutive stature, grotesque appearance, inactivity, uncleanly habits, gluttony, obtuse or acute sensibility, inability to regulate movements, to articulate, to count, degradation of propensities, and helplessness. The various degrees of their dependence upon others has been estimated thus: of 574—53 were as helpless as infants; 74 as children of two years old; 94 as children of seven years old; 138 could engage in simple work with some small profit, if carefully watched and directed; 179 could nearly earn their bread; and 36 could, under due discipline, maintain themselves. In this calculation, imbeciles are included. The arrestment of the evolution of intelligence, in whole or in part, may commence and be consummated previous to birth, in consequence of moral impressions or accidents or diseases on the part of the mother; during infancy, from defective nutrition or injudicious management; and during childhood up to puberty, from scrofula, rickets, hydrocephalus, and from unwise interference with the faculties in process of growth. A large number of idiots are microcephalous, or present heads of very small dimensions; and though they decay and die at an early age, they are apparently healthy. But a much larger number are not merely examples of imperfect growth; they labour under positive disease and degeneration, and present symptoms either of constitutional taint, or of those specific affections, such as convulsions and paralysis, as are referred to the nervous structure.

The ameliorations which occasionally take place under judicious treatment, and the educability of a few individuals within a certain range, have suggested to physicians and philanthropists the propriety of attempting to rouse, direct, and apply such powers as may exist. The experiment has not yet been fully carried out, but a magnificent training institution has been in operation for several years at Earlwood, Reigate; a smaller well-conducted school exists at Baldovan, in Forfarshire; and another, which is intended, and deserves to be a national establishment for Scotland, is now erecting at Larbert.—Seguin, *Traitément Moral, &c., des Idiots*; Art. 'Idiotisme,' *Dict. de Médecine*; Abbots, *Handbook of Idiocy*; Buckminster Brown, *Treatment and Cure of Cretins and Idiots*.

IDIOSYNCRASY (Gr., a peculiar temperament), the name given to any constitutional peculiarity. Thus, there are persons who have a great dislike to particular kinds of food, smells, sounds, &c., which to most persons are agreeable; and, on the other hand, a desire is sometimes manifested for things generally disliked. In particular individuals, again, an eruption of the skin will be caused by eating strawberries, or swooning by the smell of a rose, and that quite unconnected with any liking or disliking; and such effects are pro-

duced when the person is unaware of the cause. Idiosyncrasies also occur, in consequence of which certain medicines become inoperative, or certain poisons harmless. Idiosyncrasies are either permanent or temporary, sometimes arising from mere morbid conditions, and disappearing along with them.—The term is also employed to denote *mental*, as well as *physical* peculiarities.

IDOCRASE. See VESUVIAN.

IDOL (Gr. *eidōlon*, an image), **IDOLATRY** (worship [*latreia*] of images). By the name idol is meant an image intended to represent a divinity, and to be adored as such. The act of worshipping such an object as a divinity is called idolatry. Although the first principles of reason suggest to man's mind the idea of one Supreme Being, the source of all existing things, and the origin of all good (see God), yet the very earliest historical records, sacred and profane, teem with evidences of the errors into which men quickly fell through ignorance and passion, changing 'the glory of the uncorruptible God into an image made like to corruptible man, and to birds, and four-footed beasts, and creeping things' (Rom. i. 23). To these images, as well as to the images of inanimate objects, or of the ideal powers or forces supposed to be embodied in such objects;—as the sun, the moon, the stars, air, water, fire, and other natural elements—divine honours were paid by most of the ancient nations; to which honours the name of idolatry has been given. Hence, as each of these corrupt worships had its own peculiar symbols, the idolatry of the ancient Gentile religions may be reduced to four classes: 1. The idolatry of nature-worship, which was of two kinds—the first of inorganic nature, which consisted chiefly in *Litholatry*, or the worship of stones or pillars, mentioned in Leviticus, xxvi., and in Numbers, xxxiii. 52; the second of organic nature, or of the powers of nature, as *Dendrolatry*, or the worship of trees—under which form were symbolised the productive or generative powers of nature, and to which the most modern investigators of Phœnician antiquities trace the origin, as well of the grossly immoral worship of the *Ashtaro* of the Phœnicians, as of the phallic worship, which found its way, under various forms, through all the kindred races, both in the West and in the East. 2. The idolatry of animal-worship, which we find as well in the (perhaps originally symbolical) worship of the sacred oxen, the crocodiles, and serpents among the Egyptians, as in that of the still more degrading forms of animal life which constituted the object of adoration with other nations. 3. A higher form of idolatry, which prevailed among the races of Chaldean origin, was *Astrolatry*, or star-worship, which is often designated by the name of *Sabaism*. There was one form of Sabaism which cannot strictly be called idolatry, as it did not involve the use of idols, but addressed itself directly either to the heavenly bodies themselves, or to the element of fire, with which they were associated. But the same object of religious worship, coupled with the use of idolatrous representations, is found in the worship of Baal, of Moloch, and of Tammuz, the Phœnician Adonis (Ezekiel, viii. 14). 4. The last form of idolatry, and that which prevailed in the later period of the ancient Gentile religions, was *Anthropolatry*, or the worship of representations of the human form. It is chiefly familiar to us through the mythology of Greece and Rome, but it also found a place in most of the other religious systems, in some of which the representations of the human form were variously modified, so as to symbolise those special attributes which formed the peculiar objects of the worshippers' adoration. Of this

there are many examples in the mythological representations of the Egyptians and of the Indians. In the Egyptian religion, indeed, and in the later Grecian, many of the idols were representations of pure abstractions, as of certain faculties or affections of the mind, of virtuous desires, or of evil passions. Nor can it be doubted, that among the more cultivated classes, there were individuals by whom these abstractions were fully understood, and by whom the crude idolatry of the multitude was regarded solely as a device adapted to their more gross and material conceptions.

The Jews, notwithstanding the many safeguards by which the belief of the one Supreme Being was protected in their religious system, were frequently seduced into the idolatrous worship of the Gentile nations among which they were thrown. It is one of the most remarkable among the anomalies of the history of this singular people, that the great and radical purification of their faith in the unity of God dates from their protracted Babylonian captivity, from which time it was maintained, notwithstanding the effort of Antiochus Epiphanes to introduce the Greek idolatry (1 Macc. i.), down to the coming of our Lord. The idolatry into which the Jews fell at different periods was chiefly of the first and the third forms described above.

The idolatry of the savage tribes of the African and Oceanian races is for the most part of the class described under the head FETICHISM.

IDRIA, a small but important town of Austria, in the crownland of Carniola, celebrated for its quicksilver mines (discovered in 1497), is situated in a deep, caldron-shaped valley, on a river of the same name, 22 miles west-south-west of Laibach. The descent to the mines is by 757 steps, hewn in the rock, and is easy, and free from danger. They are said to be the richest in Europe. Upwards of 220 tons of quicksilver are produced here annually, and about 60 tons of cinnabar (red sulphuret of mercury). Pop. 4500, about 400 of whom are regularly employed as miners, the others chiefly in the manufacture of linen and silk fabrics and bone-lace; and in distilling spirits.

IDUME'A. See EDOM.

IDUN, or **IDUNA**, the name of a goddess of the northern mythology. She was the daughter of the dwarf Svald; but being received among the Æsir, she became the wife of Bragi. I possessed a precious apple, by the use of which the gods preserved their perpetual youth. She was carried off by the giant Thiassi, with the assistance of Loki; but the gods sent the latter after her, to bring her back, which he did, after changing himself into a falcon, and I into a nut.

IDYLL (Gr. *eidullion*, Lat. *idyllium*, a little image), a term generally used to designate a species of poem representing the simple scenes of pastoral life. It is, however, an error to suppose that the idyll is exclusively pastoral; certainly, there is no warrant for such a notion in the usage either of the ancients or the moderns. Of the thirty *Eidyllia* of Theocritus, not more than one-half are pastoral in their character. After the use made of the word by Tennyson, in his *Idylls of the King*, which are epic in their style and treatment, and romantic and tragic in their incidents, it becomes very difficult to say what is not an idyll.

IGLAU, a very old walled town of Austria, in the province of Moravia, is situated on the river Iglawa, close to the Bohemian boundary, 49 miles west-north-west of Brünn. It consists of the town proper and of three suburbs. In the midst of the spacious and beautiful town square, stands the guard-house. I. carries on spinning, dyeing, and brewing,

as well as extensive manufactures of woollen goods and of machinery. Its trade, especially with Poland, is very important. Several very productive silver-works are in operation here. Pop. 18,160.

IGLOO'LIK, an island of some historical interest, lies near the east end of the Strait of the Fury and Hecla, in lat. 69° 21' N., and long. 81° 53' W. It was named after an intelligent Esquimaux woman, Parry's guide and pilot on his second voyage; and here that navigator passed the winter of 1822—1823 from 30th October to 12th August. During this time, the temperature ranged between -45° and 59° of F., thus yielding a mean of 7° above zero.

IGNATIUS, St. Bishop of Antioch after 69 A.D., is said to have been a disciple of St John, and is reckoned one of the apostolical Fathers. He bore the surname of *Theophoros*—i. e., one who carries God [or as I. explained it, 'Christ'] in his heart; or, again, as some (Jerome amongst them) wrongly supposed, 'one who was carried by God'—i. e., Christ (cf. Mark, ix. 36)—whom, however, according to St Chrysostom, I. never saw. This legend that he was the little child whom Jesus set in the midst of his disciples, may, however, like the other tradition of his relationship to St John, be taken as symbolic of his winning, affectionate nature. I. was a true shepherd of his people, one of those meek, earnest, loving spirits to whose beautiful unobtrusive piety Christianity owed its first and best triumphs. Domitian's persecution of the church of Antioch proved him to be no less courageous than pious, and when that storm had passed over, the second and fiercer persecution of Trajan gratified I.'s wish of being sacrificed for his flock. The story of his interview with Trajan has come down to us. That strong ruler, full of worldly sagacity, just and virtuous after his fashion, could not understand a man so utterly unworldly as Ignatius. He contemptuously called him a *kakodaimon*, or, as we should say, 'a poor devil,' and in the end condemned him 'to be led as a prisoner to Rome, there to be made the food of wild beasts for the amusement [*ad delectationem*] of the people.' The sentence was executed 107 A. D., or, according to others, 116 A.D. In the Church of Rome, his martyrdom is commemorated on the 1st of February; in the Greek Church, on the 20th December.

The genuineness of the writings (a Liturgy, and a little work entitled *Didaché*, quoted by Chrysostom) and epistles ascribed to him—of which fifteen (twelve in Greek and three in Latin) are now extant—and some of which are quoted in the 2d, 3d, and 4th centuries, and were widely read in the ancient church, has been eagerly discussed and much disputed since the 16th century. The common opinion of scholars (until perhaps the last twenty years) was in favour of the genuineness of seven of the Greek epistles, which are extant in two redactions of different length, and in two corresponding ancient Latin translations—those to the Ephesians, Magnesians, Philadelphians, Trallians, Smyræans, Romans, and to Polycarp, his contemporary; but even these were regarded as spurious by Daillé, Semler, Hermann, Ernesti, and others, with whom in the main Neander concurs. The controversy received a new impetus by the publication of Bunsen's *Ignatius und seine Zeit* (Hamb. 1847), in which that writer endeavoured to establish the genuineness of three of the seven epistles, and the spuriousness of the others; his conclusions were, however, assailed by the great leader of the Tübingen school, F. C. Baur, in his *Die Ignatianischen Briefe und ihr neuester Kritiker* (Tüb. 1848). The most probable view of the seven epistles is that which conceives them to have a

basis of genuineness, but to have suffered extensive interpolation. The reason why these epistles have excited so keen an interest, especially among ecclesiastics, is, that the question of church government is believed to hang very much upon them; they are, in fact, a battle-ground between Episcopalians and Presbyterians; and as they seem to favour the hierarchical system of the former, Episcopalians have, as a rule, been strenuous in defence of their Ignatian origin, while Presbyterians have as warmly attacked it. The discovery, in an Egyptian convent, of a Syriac version of three of the epistles—those to the Romans, the Ephesians, and to Polycarp (published by the Rev. W. Cureton, formerly of the British Museum, under the title of *The Ancient Syriac Version of the Epistles of St Ignatius*, &c., Lond. 1845), has, on account of its possessing higher claims to be considered genuine than any Greek MSS., led to the conclusion that the common Greek text has been very seriously tampered with—the interpolations consisting often of passages enforcing episcopal authority, and asserting the deity of Jesus Christ.

The best edition of the writings ascribed to I. is contained in the *Patres Apostolici* of Cotelierus (2d edit. Amst. 1724); of those commonly held to be genuine, by Jacobson (Oxford, 1838); various translations of the seven epistles have been made into English—the best known is that by Archbishop Wake.

IGNATIUS' (St) BEANS, the seeds of the *Ignatia amara*, formerly *Strychnos Ignatii*, a tree of the natural order *Loganiaceae*, and nearly allied to that which produces *Nux vomica* (q. v.), a native of Cochin-China and of the Philippine Islands. The fruit is of the size of a large pear, and contains about twenty brownish seeds, of about the size of olives, rounded on one side, and somewhat angular on the other. These seeds came into the Dutch shops under their present name about the end of the 17th c., but there is some reason to think that they are the *nux vomica* of earlier writers. They contain *strychnia*, and their medicinal uses are similar to those of *nux vomica*.

IGNATIUS LOYOLA. See LOYOLA.

IGNEOUS ROCKS are those which have been produced from materials fused by heat. They differ from the sedimentary rocks in their origin, structure, and position. They invariably come from below upwards, breaking through the older rocks. The materials of sedimentary strata are fragments of pre-existing rocks, worn, by the action of water, either into a fine mud or into rounded particles, of greater or less size; whereas igneous rocks exhibit either a vitreous structure, as when they have been quickly cooled; or a granular structure, composed of more or less minute crystals, according to the rate of cooling; or a vesicular structure, when they have been expanded by the contained gases, or by being brought into contact with water. Some rocks are erroneously called igneous, whose materials, though originally obtained from volcanoes or other subterranean source, have yet been ultimately arranged by water, like the materials of Grahame's Island (q. v.). When this fact receives due consideration, many igneous rocks, whose position is now a puzzle, will be better understood. Some of the rocks composing Arthur's Seat, near Edinburgh, are undoubtedly of this character, and before a right theory of the hill can be constructed, these must be separated from the truly igneous rocks. In position, also, the igneous may be distinguished from the sedimentary rocks, for they seldom occur regularly stratified, with a parallel upper and under surface, but are generally local, thinning out into wedge-shaped beds,

or having that irregular stratification which may be seen in modern lava. They also occur as upright walls or dykes, filling up cracks in the sedimentary strata.

The most satisfactory classification of the igneous rocks is based upon their age. The three obvious divisions thus established are each characterised by peculiar mineral and structural differences. The oldest or Granitic series (q. v.) are generally associated with the Palæozoic strata, but are sparingly found in the Secondary, and even in the Tertiary formations. The special peculiarity of the granitic rocks is the great abundance of silica contained in them; it forms not only a considerable amount of the constituents of the hornblende and felspar, but crystallises free in the rock-mass as rock crystal. The Trappean Rocks (q. v.) are associated with the Palæozoic and Secondary strata, and are composed of crystals of felspar and hornblende, varying in their character according to the predominance of the one or other of these ingredients. The Volcanic (q. v.) are the newest igneous rocks; they belong to the present period, or the Tertiary strata. The chemical ingredients are the same as those that constitute the Trappean rocks, but they are somewhat differently built up, augite being the peculiar form the silicate of magnesia and lime assumes in the newer rocks, while it appears as hornblende in the older or Trappean series.

IGNIS FATUUS (Lat. 'vain or foolish fire') is a luminous appearance frequently seen in marshy places, churchyards, and over stagnant pools, which has puzzled philosophers from the time of Aristotle. It generally appears a little after sunset, as a pale bluish-coloured flame, varying in size and shape; sometimes it shines steadily till morning, at other times disappears, and reappears within about half-hourly intervals. It floats in air at about two feet from the ground, is sometimes fixed, and sometimes travels with great rapidity. In general, it recedes on being approached, and *vice versâ*, though several successful attempts have been made to light a piece of paper by it. Many efforts have been made to discover its cause; but so varied are its appearances, and so void of any common principle, that these attempts have totally failed. Of the various theories advanced we need mention only two. The first is, that the ignis fatuus is due to *phosphuretted hydrogen gas* (PH_3), which possesses the power of spontaneous ignition on coming in contact with dry atmospheric air; the gas would be generated by the decomposition of animal matter present in a marshy soil. The motion of the ignis fatuus is accounted for by the flame being communicated along the line of a stream of the gas. The second is, that it is due to the combustion of *light carburetted hydrogen gas* (C_2H_4), arising from the decomposition of vegetable matter; but though this supposition satisfactorily accounts for many appearances connected with the ignis fatuus, the gas itself is not spontaneously combustible, and an additional supposition requires to be made to account for its ignition. The probable conclusion is, that a number of phenomena similar to the eye, but arising from different causes, are aggregated under the term ignis fatuus. *The ignis fatuus, however, has never been produced artificially.* Electricity and phosphorescence can produce the luminous appearance, but, as far as our present knowledge enables us to judge, they are unable further to imitate it.

It is not a common phenomenon, many distinguished naturalists never having seen it; but it is not unfrequently seen in the north of Germany, the swampy and moorland districts in the south and north-west of England, and in the Lowlands of Scotland. It is seen in the above places from the

middle of autumn till the beginning of November. In former times, the *ignis fatuus*, under the names of *Will-o'-the-wisp*, *Jack-a-lantern*, *Spunkie*, &c., was an object of superstition among the inhabitants of the districts where it appears, and was believed to be due to the agency of evil spirits attempting to lure the traveller to his destruction; and, unfortunately, there are too many instances on record of travellers mistaking the *ignis fatuus* for a lamp, and being thus decoyed into marshy places, where they perished.

IGNORAMUS (Lat. we do not know), the word formerly written by a grand jury on the back of an indictment, meaning that they rejected it. The words now used are 'Not a true bill,' or 'Not found.'

IGNORANCE OF THE LAW, or **IGNORANTIA JURIS**, is held in law to be no excuse for any breach of contract or duty, nor for crime or other offence. It is absolutely necessary to start with this maxim, otherwise it would be quite impossible to administer the law, for if once a contrary maxim were allowed, it would not only be a premium to ignorance, but would lead to endless and abortive inquiries into the interior of a man's mind. Ignorance of a fact, however, is a different thing. Another kindred maxim of the law is, that every man intends the consequences of his own act. Thus, if he shoot at or give poison to a person, it is presumed that he intended to kill such person. So, if he leave a trap-door open in a street or thoroughfare, it is held that he intended people to fall into it and be injured. There is, however, a doctrine called *bona fides*, which, in the case of petty offences punishable by justices, often tempers the strict and rigid application of the maxim, *ignorantia juris neminem excusat*; and even in crimes, a judge always takes into consideration, when passing judgment, whether the prisoner or defendant was an ignorant or intelligent person.

IGNORANTINES (Fr. *Frères Ignorantins*), a religious congregation of men in the Roman Catholic Church, associated for the gratuitous instruction of poor children in sacred as well as secular learning. It was founded in France in the early part of the 18th c. (1724), by the Abbé de la Salle, and has gradually been introduced into every Catholic country of Europe. In France, this congregation shared at the Revolution the fate of all the other religious bodies; but the brethren, under the name of Brothers of the Christian Schools, were recalled, and re-established under Napoleon in 1806. They are now exceedingly numerous in France, Italy, and Germany, and many branches exist in England and Ireland. In the latter country, they possess, especially in Dublin, Cork, Limerick, Waterford, large educational establishments; and they have published for the use of their schools a series of school-books, which are designed to combine with secular knowledge information on the subject of religion, specially designed for Roman Catholic pupils.

IGUALADA, a town of Spain, in the modern province of Barcelona, and situated about 40 miles west-north-west of the city of that name, on a rising ground on the left bank of the river Noya. It is for the most part closely built, dark, and dirty; carries on manufactures of cotton and woollen goods, hats and firearms, is the seat of considerable trade, and contains a population of 10,000.

IGUANA, a genus of saurian reptiles, the type of the family *Iguanidae*, a family which contains many genera and species, and to which belong some of the largest saurians now existing, except those of the crocodile family. Far larger saurians allied to them existed in former geological periods. See

IGUANODON. The *Iguanidæ* have a lizard-like form and a long tail. The tongue is thick, fleshy, not extensible, and is notched at the tip. They have rows of small teeth on the palate, and their jaw-teeth are remarkable both for their form and mode of insertion, not being lodged in distinct sockets, but fixed in a kind of furrow along the internal face of the jaw-bone, adhering by one side of the bony surface of the root. The food of the *Iguanidæ* consists chiefly of leaves and fruits. They are all natives of warm climates. In the genus *I*, the

Iguana.

back exhibits a row of elevated, compressed, pointed scales along its whole length, and which is continued to the extremity of the tail; whilst under the throat is a great dewlap-like pouch. The feet have long toes, not webbed, with sharp claws, well adapted for climbing trees, while the compressed tail is the organ of progression used in swimming. The **COMMON I**, or **GUANA**, is abundant in the West Indies and tropical parts of America, living mostly among trees. It attains a length of four or five feet. It is of a greenish-yellow colour, mottled with green, the tail ringed with brown. It is esteemed a most delicate article of food, and is used by all classes of persons. It is often caught by means of a noose thrown over its head; dogs have also been trained to hunt it on some of the West India *keys*, where it has not opportunity of taking refuge in trees. The eggs—which are about the size of those of a pigeon, but have no hard shell, and are laid in the sand—are also eaten, and are very pleasant. Other species of *I* and nearly allied genera are eaten in tropical America, as the Horned *I*. (*I. cornuta* or *Melopoceros cornutus*) of Hayti. The true iguanas are all American.

IGUANODON (*Iguana*, and Gr. *odous*, tooth), a genus of remarkable gigantic dinosaurian reptiles, more abundant in the Wealden beds of Kent, Sussex, and the Isle of Wight, than any other genus of associated saurians. Their singular structure, differing in many important particulars from any known reptile, long caused great diversity of opinion as to their true position. Dr Mantell, their original discoverer, and their learned expounder, first knew of their existence from some enormous bones, which, notwithstanding their colossal size, he considered reptilian. A large tooth next turned up, whose smooth worn crown attested its having belonged to a herbivorous animal. Numerous other specimens of teeth were in progress of time discovered, and Dr Mantell found that they corresponded in a remarkable manner with the teeth of the small American lizard, the iguana, although they exhibited very striking and

important differences. Since the original discovery of the teeth, several other portions of this remarkable reptile have been found. The fragmentary and imperfect materials which have yet turned up make any estimate of the size of this animal purely hypothetical. Dr Mantell's estimate is as much as 70 feet in extreme length, while Professor Owen considers it to have been not over 28 feet.

The structure of the skeleton is very remarkable. The fragments of the upper and lower jaw shew that the head was produced into a short snout, which supported a nasal horn. The vertebral column was somewhat fish-like; the joints being slightly concave on both surfaces, yet it had lofty neural arches, and the sacrum was composed of five anchylosed joints, a structure found in no other reptile. The limbs were long and strong, raising the body some distance from the ground. The largest femur yet found measures four feet eight inches in length, and the shaft has a circumference of twenty-five inches. The leg terminated in a three-toed foot, which produced the enormous tridactyle impressions on the argillaceous Wealden beds that were for some time considered to be the footprints of huge birds. The discovery by Professor Owen of all the bones of a perfect foot, however, conclusively connects these impressions with the iguanodon. His figure,

1. Footprint of Iguanodon, from the cliff at Hastings, one-sixteenth natural size.

2. Reduced track, exhibiting the Arrangement of the Footprints.

in a recent volume of the Palæontographical Society's publications, exhibits a foot 21 inches long by 9½ inches broad, while our figure is reduced from a footprint 24 inches long.

The teeth of the iguanodon, while bearing a general resemblance to those of the iguana, were much more complicated both in external form and internal structure than in any other known reptile. In all other known reptiles, the vertically flat teeth are always sharp-edged, and fitted only to cut off the plants on which they feed, but the worn crowns in this animal shew that the iguanodon thoroughly triturated its food before swallowing it.

IHRE, JOHAN, an eminent Swedish scholar of Scottish extraction, was born at Lund in 1707, and educated at the university of Upsala, where he acquired a great reputation, and carried off the highest honours. He subsequently travelled in France and England, was appointed under-librarian to the Academy of Sciences, on his return to Sweden, and rose through a variety of offices to be professor of belles-lettres and political economy (1748). He died in 1780. I.'s principal work is his *Glossarium Suiogothicum* (1769), a work of great talent and erudition, which may be regarded as the foundation

of Swedish philology. It was got up at the cost of the state, which gave I. 10,000 dollars to execute it. His numerous academical disputations, amounting to upwards of 450, are still valuable, especially those on the Mæso-Gothic version of the Gospels by Ulfilas.

IKUPA, the principal river of Madagascar (q.v.).

ILCHESTER, a small and decayed town of England, in the county of Somerset, is situated in the rich valley of the Yeo or Ivel—from which it derives its name—33 miles south-south-west of Bath. The principal buildings are the parish church, an ancient structure surmounted by a low octagonal tower, and the county jail. I., supposed to be the Ischalis of Ptolemy, was the principal station of the Romans in this region, and was fortified by them with a strong wall and ditch, both still traceable. Numerous Roman remains have been found here. I. is the birthplace of Roger Bacon. Pop. (1861) 781.

ILE-DE-FRANCE, one of the old provinces of France, having Paris as its capital, and now mostly comprised in the departments of Seine, Seine-et-Oise, and Oise. During the last century of the Carolingian dynasty, the Ile-de-F. was possessed by a race of powerful nobles, who latterly took the title of Dukes of France. One of the most able of these was Hugo or Hugues, surnamed Le Blanc, or Le Grand, who, for 20 years previous to his death (956), virtually wielded the sovereign power under the Carolingian kings Louis IV. and Lothaire. His son, Hugo Capet, eventually became the actual sovereign. See CAPEtian DYNASTY.

I'LETZK, or ILETZKAÏA ZASHCHITA, a small town and fort in Eastern Russia, on the border of the Kirghiz territory (government of Orenburg), situated on the river Ilek, near its confluence with the Ural, in lat. 51° 9' N., long. 54° 59' E. The town was founded by Cossack emigrants in 1737, and now contains a population of 2424 inhabitants. It is remarkable for its quarries of rock-salt, the richest in Russia. The salt-beds of I. were formerly worked by the native Bashkirs, but since 1754, both the extraction and sale of the salt are monopolised by the government, and are the source of considerable revenue. All the country round I., especially along the river Solianka, is one continual layer of salt, covered with a sandy or clayey alluvion, 3½ to 4½ feet thick. The thickness of the salt bed is not yet thoroughly ascertained, notwithstanding many investigations, from Pallas up to the present time. The I. salt is considered the best in Russia. On the surface of the bed, cubic blocks of salt are found, pure and transparent like crystal, and weighing from 3 to 30 lbs. each. Various small articles are manufactured out of such blocks, and the common people ascribe to them a healing virtue in ophthalmic disease. The quantity of salt worked in 1859 was 4354 tons; in 1856, it was above 14,000 tons.

I'LEUM. See DIGESTION, ORGANS OF.

I'LEUS, or ILIAC PASSION, is regarded by some writers as a distinct disease, but is in reality the closing stage of the severest forms of enteritis, or of colic, and is often connected with some irremovable mechanical obstruction. It may indeed occur in any case in which the contents of the bowel cannot find their way onwards. The peristaltic action of the intestine is inverted; there is intense vomiting, and even feculent matter is discharged by the mouth. Desperate as the condition of the patient is, his case is not absolutely hopeless; but as recovery, when it occurs, is due rather to nature than to art, it is unnecessary to enter into the subject of treatment.

I'LEX, a tree often named in the Latin classics, the Evergreen Oak or Holm Oak (*Quercus Ilex*). See OAK. It is a native of most parts of the south of Europe and of the north of Africa, often attaining large dimensions, as it sometimes does where planted in Britain. It grows in general singly or in small groups, and loves the vicinity of the sea. Its leaves are ovate-oblong, acute, leathery, hoary beneath; but they vary much in some respects, from the size of a sloe-leaf to that of a beech, and from being very spiny at the edge to perfect evenness. It is a very ornamental tree, and has not been so much planted in Britain as it deserves. Its wood is very hard and heavy, tough, durable, and useful, particularly for axles, pulleys, screws, and whatever is to be subjected to much friction. The acorns are of various quality, sometimes bitter, and sometimes sweet and eatable.—In modern botany, *Ilex* is the generic name of the Holly (q. v.).

I'LFRACOMBE, a small market-town, seaport, and watering-place of England, on the north coast of the county of Devon, is finely situated amid picturesque irregular hills, on a cove or inlet of the Bristol Channel, 11 miles north-north-west of Barnstaple. The harbour is formed by ramparts of rock, and furnished with a light-house, and a pier 850 feet in length. The bathing establishment is a Doric building, erected here in 1836, and supplied with sea-water from the shore by means of a tunnel. The town is chiefly dependent upon its wealthier residents and its summer visitors; but an active fishery and coasting-trade are also carried on. Pop. (1861) 3034.

I'LIAC A'RTERIES. The Aorta (q. v.) divides at its lowest point—which is usually on the left side of the body of the fourth lumbar vertebra—into the two common iliac arteries, which pass downwards and outwards on each side to the margin of the pelvis for about two inches and a half, and then divide into the external and internal iliac artery of either side. The external iliac passes obliquely downwards and outwards to the femoral arch, when it enters the thigh, and becomes the femoral artery. The internal iliac is a short vessel, about an inch and a half in length, which divides into an anterior and a posterior trunk. The anterior trunk divides into several branches, which supply the bladder, the rectum, the generative organs, and muscles both within and on the outside of the pelvis, with arterial blood; while the branches of the posterior trunk mainly supply muscles within and on the outside of the pelvis. The importance of the internal iliac artery in carrying on the circulation in uterine life is noticed in the article FÆTUS.

ILI'SSUS. See ATHENS, and ATTICA.

I'LTIUM. See PELVIS.

ILIUM. See TROY.

I'LKESTON, a thriving market-town of England, in the county of Derby, and situated ten miles north-east of the town of that name, on an eminence in the valley of the Erewash. Manufactures of hosiery and lace are here carried on, and a number of the inhabitants are employed in the coal and iron works of the vicinity. Pop. (1861) upwards of 8000.

ILLE-ET-VILAINE, a maritime department in the north-west of France, formed out of a portion of the old province of Bretagne, is quadrangular in shape, and lies between the English Channel and the department of Loire-Inférieure. Area, 2573 square miles, or 1,646,670 square acres, of which 1,016,580 acres are arable land; pop. (1862) 584,930. It is watered chiefly by the rivers from which it derives its name—the Vilaine, and its tributary, the Ille. The usual grain-crops are raised in sufficient quan-

tity to meet the wants of the population. Flax and hemp are extensively produced, and the cider of this district is esteemed the best produced in the country. Cattle are reared in great numbers, iron mines are worked, and great varieties of linen and woollen fabrics are manufactured. The department is divided into six arrondissements—Rennes, Fougères, Montfort, St Malo, Vitré, and Redon. Rennes is the capital, and St Malo the principal seaport.

ILLEGI'TIMACY. See LEGITIMACY; BASTARDS.

ILLI'CIUM, a genus of trees of the natural order *Magnoliacea*, having flowers with three or six petal-like sepals, numerous petals arranged in several rows, and numerous stamens and pistils; the capsules arranged in a star-like form, opening upwards, and each containing a single seed. The species are few, but very widely distributed. The most important is *I. anisatum*, the fruit of which is known as Star Anise, or Chinese Anise. See ANISE. This tree is held in high estimation among the Japanese, and is planted near their temples, as their gods are supposed to delight in it.—Among the other species is *I. Floridanum*, a shrub with fine pendent clusters of dark purple flowers, native of Florida and Louisiana, of which the leaves are very fragrant, the capsules also smelling of anise, though more faintly than those of the Chinese tree. Similar in fragrance is *I. parviflorum*, another Floridian species.

ILLIMA'NI, one of the principal mountains of the Bolivian Andes. See ANDES.

ILLINOIS, a river of North America, is formed in the north-east portion of the state of Illinois by the union of the Kankakee and Des Plaines, flows south-west, and joins the Mississippi 20 miles above the mouth of the Missouri. It is 500 miles long, and is navigable for 245 miles. It is broad, deep, and sluggish, and widens occasionally into lake-like expanses. It is connected by a canal with Lake Michigan.

ILLINOIS, one of the United States of America, extending from 36° 56' to 42° 30' N. lat., and 87° 35' to 91° 40' W. long., being 388 miles long, and 212 wide; containing an area of 55,405 square miles, or 35,459,200 acres. It is bounded N. by Wisconsin; E. by Lake Michigan, and the state of Indiana, from which it is partly separated by the Wabash river; S. by the converging rivers Mississippi and Ohio, which separate it from Missouri and Kentucky; and W. by the Mississippi, which separates it from Missouri and Iowa. The state is divided into 101 counties; the capital is Springfield, near the centre of the state, and the most important towns are Chicago, the principal port on Lake Michigan, Galena and Alton on the Mississippi, and Cairo, at the southern terminus of the Central Railway, and the confluence of the Ohio and Mississippi rivers. The population of the state has increased with marvellous rapidity. In 1810, it was 12,282; in 1820, 55,211; in 1830, 157,445; in 1840, 476,183; in 1850, 851,470; and at the last census of 1860, was 1,711,753. More than half the people of I. were born in other states or foreign countries, a large number being Irish and Germans. In 1850, there were but 707 paupers in a population of 851,470. The state of I. is generally level, having few hills and no mountains. The lowest portion is but 340 feet, and the highest only 800 feet above the Gulf of Mexico. It is nearly covered by fertile prairies; while river-bottoms, with a soil of vegetable mould 40 feet in depth, have produced heavy crops of maize for many successive years without manuring. The country is so level that the canal which unites Lake Michigan with Illinois river and the Mississippi is fed by water pumped from the lake to a height of twelve feet.

The principal rivers, besides those which form the boundaries, are the Illinois and Rock rivers, and their tributaries. The whole state is of limestone formation, with rich lead deposits in the north-west, and a large portion of the great bituminous coal formation, 375 miles long and 200 wide, lying in this and the adjoining states. The climate is mild, with an average of 77° Fahr. in summer, and 33½° in winter, but ranging from 20° below to 100° above zero; it is also healthy, except in swamp-lands or river-bottoms, which are subject to fever and ague and bilious diseases. The productions are wheat, maize, tobacco, cattle, hogs, apples, pears, peaches, grapes, &c. There are over 3000 miles of railway, including the Illinois Central, 708 miles, and the Galena and Chicago, 459 miles.

In 1858, there were 10,238 public schools, 530 private schools, 58 academies and seminaries, and 21 colleges. In 1850, there were 1233 churches; but the population having doubled since that period, there has been a proportional increase. In 1830, the Mormons built the city of Nauvoo, on the Mississippi; but in 1844, their prophet, Joseph Smith, was killed by a mob; and his followers, 20,000 in number, made their exodus across the plains to the territory of Utah.—I. was first explored by La Salle, and the French missionaries and Indian traders, who formed the earliest settlement at Kaskaskia, in 1673. Ceded by France to Great Britain, and then to the United States, it remained a portion of the North-west Territory, until its organisation as a state, with a governor and legislature, in 1818. (1870—pop. 2,539,891.)

ILLUMINATED MANUSCRIPTS. See MANUSCRIPTS.

ILLUMINATI, a name which has at different periods been borne by four different societies—that of the *Alombrados* in Spain, in the end of the sixteenth century; that of the *Guerinets* in France, about the year 1634, enthusiasts and visionaries; an association of Mystics in Belgium, in the latter half of the 18th century; and the *Order of the Illuminati*, which was founded at Ingolstadt on May 1, 1776, and soon spread over almost all the Roman Catholic parts of Germany. It is this which is now commonly meant when the name Illuminati is employed. Its founder at first called it the Order of the Perfectibilists. It owed its existence to Adam Weishaupt, Professor of Canon Law at Ingolstadt, a man of superior abilities and much benevolence, but deficient in practical knowledge of mankind. Filled with detestation of Jesuitism, and impatient of the restraints which were at that time imposed on the human mind in Roman Catholic Germany, and in no part of it more than in Bavaria, under the bigoted administration of the Elector Charles Theodore, he conceived the idea of forming an association which should extend its ramifications everywhere, and should consist of the choicest spirits, should labour for the establishment of the dominion of reason, and promote religious and political enlightenment and emancipation. Religious dogmas and forms of worship were to be rejected, a system of deism was to be propagated, and republican opinions. The accession of the Baron von Knigge to the new order, and the support which it received from the Freemasons, led to its rapid extension, so that, at one time, more than 2000 of the most accomplished men in Germany were members of it. Weishaupt's knowledge of the order of the Jesuits led him to borrow some of their methods for the accomplishment of what he regarded as the most opposite ends; and the Illuminati were soon involved in a system of mutual espionage, confession, and the like, essentially inconsistent with true

freedom, but calculated to place the threads all in one hand, by which the holy legion was to be led on, as it was imagined, to the benefaction of mankind. But from this cause, the dissolution of the order soon ensued. Weishaupt and Knigge, its two leaders, quarrelled with one another. The order began to be openly denounced as dangerous, and, on the 22d of June 1784, an edict was issued by the Elector of Bavaria for its suppression, which was followed by another on 2d March 1785. Weishaupt was degraded and banished. He retired to Halle, where he died in 1830, at the age of 83. Various other members were severely punished, and the form of justice was not strictly observed in the proceedings against them.—Great importance was at one time attached to the order of the Illuminati, whose secret influence was regarded as a principal cause of many of the political events of the time of the French Revolution, and the works of Abbé Barruel and of Professor Robison of Edinburgh upon this subject were eagerly read, but the highly exaggerated character of their views is now generally acknowledged.

ILLUPIE. See BASSIA.

ILLUSORY APPOINTMENT, a legal phrase which denotes that where a person has a power or faculty to divide property among several others, such as children, and he gives one or more a very small sum, and the bulk of the property to the rest, the former is called an illusory appointment. In vulgar parlance, it is like cutting off an heir or child with a shilling. In general, it is competent, both in England and Scotland, to make an illusory appointment, but much depends on the peculiar terms of the deed or will originally giving this power to appoint or divide.

ILLUSTRATED PUBLICATIONS are a remarkable feature of the literature of our times. The employment of illustrations or pictorial sketches to render books more intelligible and attractive, has long been common, but has of late years been carried to an extent previously unknown. There are two methods of illustration: by copper or steel plate engravings, which, being on leaves apart from the text, are executed separately; and by wood-engravings, which, inserted as blocks in the typography, are printed as part of the work. Wood-engraving is not new, but it was little employed for general illustration until comparatively recent times. Throughout the 18th and the first quarter of the 19th c., illustrations, for the most part, consisted of separate engravings on copper. See ENGRAVING. In the early part of the 19th c., books of travels and works of a fanciful kind, and also in natural history, issued in London, were illustrated chiefly by aquatint engravings. Among the artists who were noted for this species of illustration were Rowlandson, John Clark, and the Cruikshanks, and as the engravings were coloured by hand, they were particularly attractive. Clark was principally employed to illustrate voyages and travels. In the preparation of designs for these illustrations, the author of the work was usually much indebted to the artist, who, in many cases, was furnished with only a few scratches to guide him in his representations. The use of aquatint engravings was at length superseded by lithography; but before this new species of illustration came greatly into vogue, wood-engraving took the place of all kinds of illustration except that of the high-class line steel-engravings, which are still in use for costly publications. The taste for illustrated works first sprung up in England, and thence it extended to France, Germany, and the United States. From 1820 to about 1830, was the great era of Illustrated Annuals (q. v.). The

taste for these illustrated year-books ultimately wore itself out, and was succeeded by a demand for highly illustrated books of poetry by popular authors, such as Rogers, Byron, and Campbell, and in the disposal of these elegant works, some publishers realised handsome fortunes. Latterly, illustration has consisted for the greater part in wood-engravings, for they possess the inestimable advantage of being printed with the letter-press, and in the hands of high-class artists, the design and execution of these embellishments have reached extraordinary perfection. Executed with comparative cheapness and rapidity, wood-engravings have been largely employed to illustrate a class of popular periodicals, and encyclopædias, and newspapers. *The Illustrated London News* was the first, and continues to stand at the head of illustrated newspapers. See WOOD-ENGRAVING.

ILLYRICUM (Gr. *ILLYRIS*, *ILLYRIA*) is the Roman name of a country whose limits in ancient times varied very considerably. In the 4th c. B.C., the Illyrians, who are the ancestors of the modern race generally known as Albanians (see *ALBANIA*), inhabited the whole eastern coast of the Adriatic Sea and adjacent islands, with the western parts of Macedonia as far as Epirus. Philip of Macedonia conquered the country as far as the river Drilon (modern Drino), and thence arose the division into *Illyris Græca* and *Illyris Barbara* or *Romana*. The former, now Albania (q. v.), was incorporated with Macedonia. *Illyris Barbara* or *Romana* was divided into Iapydia, Liburnia, and Dalmatia. The Illyrians were much addicted to piracy, which soon brought them into collision with the Romans, and led to their subjugation about two centuries B.C. They made numerous efforts to shake off the Roman yoke, but were always defeated, and the country became a most important province of the Roman empire, comprising the territory represented in modern times by Croatia, Dalmatia, Herzegovina, Montenegro, nearly all Bosnia, and a part of Albania. On the division of the Roman empire, I. shared in the vicissitudes that followed that act. A decree of Napoleon, on 14th October 1809, gave the name of Illyrian Provinces to Carniola, Dalmatia, and other countries from the Adriatic Sea to the Save, then belonging to the French empire. At his fall, these provinces were united as a kingdom to the Austrian empire, and some alterations were made in its boundaries, especially by the restoration to Hungary of what had formerly belonged to it, and the annexation of the whole of Carinthia instead. The kingdom was divided into the two governments of Laibach and Trieste, Laibach being the capital, which arrangement subsisted till 1849, when it was subdivided, for administrative purposes, into the duchies of Carinthia (q. v.), Carniola (q. v.), and the coast district, containing the counties of Görz (q. v.), Gradiska, and Istria (q. v.), with the city and territory of Trieste (q. v.).

ILMEN (formerly *Moysk*), a lake in North-western Russia, government of Novgorod, 27 miles long, 20 miles broad, and 16 feet deep. The lake is stormy, and unfit for navigation; its bottom stony. The rivers Shelon, Lovat, Msta, and several others, flow into the lake, which discharges its waters through the river Volkhof into Lake Ladoga. The lake abounds in fish, chiefly sandres, bream, and smelt, and fishing on its banks occupies a population of about 20,000. The lake I. is historically remarkable, because it was on its banks that the Slavonian tribes lived, who, a thousand years ago (862), invited the Variago-Russ to come and rule over them, from which time dates the origin of the Russian nation.

ILMENIUM, the name applied by Hermann to a new metal analogous to tantalum. He obtained its oxide from a mineral to which the various names of *Urano-tantalite*, *Samarските*, and *Ytiro-imenite* have been applied, and which occurs in the Ilmen Mountains in Siberia. Its existence as an independent metal is not satisfactorily established.

ILMINSTER, a small but ancient market-town of England, in the county of Somerset, is situated on the right bank of the Isle, 44 miles south-west of Bath. The Free Grammar and Commercial Schools, with an endowment of nearly £1000 a year, were founded in 1586. Some manufactures of woollens, silks, and lace are carried on. Pop. (1861) 3219.

IL OBEID, or **EL OBEID** (pronounced *Lobeid*), an important trading town of Africa, capital of Kordofan, is situated in lat. 13° 11' N., long. 29° 35' E., at the foot of a long and gradually sloping plain, the drainage from which, after heavy rains, frequently inundates the principal streets. The town consists of a number of villages, originally separate, and inhabited by distinct races, but now joined together, and only distinct enough to form separate quarters. The houses and mosques, as well as the government offices, are almost all built of a fragile clay, and the general appearance of the place is uninviting, gloomy, and dirty. The *zoog*, or market-place, contains four rows of booths, and fruit, vegetables, tobacco, and manufactures in iron and wood are here sold. The wholesale trade is carried on in private houses. Gum-arabic, ivory, tamarinds, and ostrich feathers, are the chief articles of export. Population estimated at about 30,000.

ILO'RI, **ILO'RIN**, or, more properly, **ALORI**, a very large town of Africa, the great centre of the Fulbe, in Yóruba, is situated in lat. 8° 30' N., and long. 4° 33' E., 46 miles south-west of the banks of the Niger, and about 150 miles north-east from the shore of the Bight of Benin. Nothing very definite seems to have been published regarding it. Dr Barth, in conversing about I. with an intelligent native who had lived for a long time in Constantinople, was told that it was 'without the least doubt larger than the latter city.'

ILSLEY, **EAST**, a small but ancient market-town of Berkshire, England, is situated in a secluded valley amid bleak and dreary downs, about 56 miles west of London. It is remarkable chiefly for its sheep-markets, which are among the most important in the kingdom; 50,000 sheep have been known to be penned for sale here in one day. The ordinary sheep-fairs are held on every alternate Wednesday, from the Wednesday fortnight before Easter till July. The downs in the vicinity of the town are celebrated as training-grounds for race-horses. About a mile distant is the village of West Ilsley. Pop. (1861) less than 1000.

IMAGE-WORSHIP (Gr. *iconolatria*), the use, in public or private worship, of graven or painted representations of sacred persons or things, and especially the exhibition of honour, reverence, or worship to or towards such representations. This practice, in the various degrees of which it is susceptible, has formed, for many centuries, so fruitful a subject of controversy among Christians, that we think it expedient first briefly to detail the history of the use of images in Christian worship during the several periods, and secondly to state summarily the opposite views of this history which are taken by the two great parties into which Christians are divided on the question.

Neither in the New Testament, nor in any genuine writings of the first age of Christianity, can any trace be discovered of the use of statues or pictures

in the worship of Christians, whether public or private. The earliest allusion to such representations is found in Tertullian, who appeals to the image of the Good Shepherd as engraved upon the chalices. A very curious pagan caricature of Christianity, of the very same age, lately discovered scratched upon the wall of a room in the palace of the Cæsars (see GRAFFITI), which rudely represents a man standing in the attitude of prayer, with outstretched hand, before a grotesque caricature of the crucifixion, and which bears the title 'Alexamenus worships God,' has been recently alleged by Catholics as an additional indication of at least a certain use of images among the Christians of the 2d century. The tombs of the Christians in the Roman catacombs, many of which are of a date anterior to Constantine, frequently have graven upon them representations of the Dove, of the Cross, of the symbolical Fish, of the Ship, of Adam and Eve, of Moses striking the rock, of Jonas, of Daniel in the lions' den, of the apostles Peter and Paul, and above all, of the Good Shepherd; and those compartments of the catacombs which were used as chapels are often profusely decorated with sacred representations, the age of which, however, it is not easy to determine with accuracy. But whatever opinion may be formed as to particular instances, such as these, it is admitted by Catholics themselves (who explain it by the fear of perpetuating the idolatrous notions of the early converts from paganism) that for the first three centuries the use of images was rare and exceptional; nor was it until after the establishment of Christianity under Constantine, and particularly after the condemnation of the Nestorian heresy in 430, that statues and pictures of our Lord, of the Virgin Mary, and the Saints, were commonly introduced in churches, especially in the East and Italy. And yet, even in the 5th c., the practice had already reached a great height, as we learn from the church historian, Theodoret, for the East, and from Paulinus of Nola, for Italy; and in the 6th and 7th centuries, many popular practices prevailed, which called forth the condemnation of learned and pious bishops both in the East and in the West. It was usual not only to keep lights and burn incense before the images, to kiss them reverently, and to kneel down and pray before them, but some went so far as to make the images serve as godfathers and godmothers in baptism, and even to mingle the dust or the colouring matter scraped from the images with the Eucharistic elements in the Holy Communion! This use of images by Christians was alleged as an obstacle to the conversion of the Jews, and as one of the causes of the progress of Mohammedanism in the East; and the excesses described above provoked the reaction of Iconoclasm (q. v.). In the second Council of Nice, 787, the doctrine as to the worship of images was carefully laid down. A distinction was drawn between the supreme worship of adoration, which is called *latreia*, and the inferior worship of honour or reverence, called *douleia*; and still more between *absolute* worship, which is directly and ultimately rendered to a person or thing *in itself*, and *relative*, which is but addressed *through* a person or thing, ultimately to another person or thing represented thereby. The second Council of Nice declared, first, that the worship to be paid to images is not the supreme worship of *latreia*, but only the inferior worship of *douleia*; and, secondly, that it is not *absolute*, and does not rest upon the images themselves, but *relative*, that is, only addressed through them, or by occasion of them, to the original which they represent. This explanation of the doctrine and the practice was thenceforth generally received; but a strange error in the translation of the Greek acts of

the Council of Nice, by which it appeared that the same adoration was decreed by that council to images 'which is rendered to the Holy Trinity itself,' led to a vehement agitation in France and Germany under Charlemagne, and to a condemnation by a synod at Frankfurt of the doctrines of the Council of Nice. But an explanation of this error, and of the false translation on which it was based, was immediately afterwards given by the pope; and eventually the Nicene exposition of the doctrine was universally accepted in the Western as well as in the Eastern Church.

At the Reformation, the reforming party generally rejected the use of images as an unscriptural novelty, irreconcilable as well with the prohibition of the old law as with that characteristic of 'spirit and truth' which is laid down by our Lord as specially distinctive of the new dispensation; and they commonly stigmatised the Catholic practice as superstitious, and even idolatrous. The Zwinglian, and subsequently the Calvinistic churches, absolutely and entirely repudiated all use of images for the purposes of worship. Luther, on the contrary, while he condemned the Roman worship of images, regarded the simple use of them even in the church, for the purpose of instruction, and as incentives to faith and to devotion, as one of those *adiaphora*, or *indifferent* things, which may be permitted, although not of necessary institution; hence, in the Lutheran churches of Germany and the northern kingdoms, pictures, crucifixes, and other religious emblems are still freely retained. In the Anglican Church, the practice is still a subject of controversy. In the Presbyterian Church, and in all the other Protestant communions, images are entirely unknown.

The Roman Catholic Church, through the decree of the Council of Trent, disclaims the imputation, commonly made against Catholics, of the idolatrous worship of images, 'as though a divinity dwelt in them, or as though we [Catholics] asked anything of them, or trusted in them, as the heathens did in their idols.' It renews the Nicene distinction between *absolute* and *relative* worship; the latter of which alone—'whereby we worship Christ and the saints, who are the prototypes of these images'—it sanctions or permits; and it contends for the great advantage, especially for the rude and unlearned people, to be drawn from the use of pictures and statues in the churches as 'memorials of the sufferings and of the mercy of our Lord, as instructive records of the virtues of the saints, and exhortations to the imitation of their example, and as incentives to the love of God and to the practice of piety' (Sess. xxv. *On the Invocation of Saints*). In many foreign churches, especially in Italy, in Southern Germany, and in France, are to be found images which are popularly reputed as especially sacred, and to which, or to prayers offered before which, miraculous effects are ascribed. But instructed Catholics declare that the legends connected with such images form no part of Catholic belief. Most Catholic books of instruction contain cautions against attributing such effects to any special virtue of the images themselves, rather than to the special faith, trustfulness, and fervour which are stirred up by their presence, and by the recorded examples of the mercy of God with which they are associated in the minds of the faithful.

IMAGINARY QUANTITY. In the working of many algebraic problems, it often happens that the root of a negative quantity must be extracted; if the root is odd, the operation can be performed (see INVOLUTION), but if even, the root can only be *formally* extracted, and is in consequence called an *impossible* or *imaginary* quantity. For instance, the

cube root of -64 is not an imaginary quantity, for $-4 \times -4 \times -4 = -64$, and therefore $\sqrt[3]{-64} = -4$; but the square root of -64 is an impossible quantity, for no possible quantity (whether it be $+$ or $-$) multiplied by itself can produce a negative quantity; similarly and *à fortiori*, the fourth root of -64 is an impossible quantity, and the same is true of all even roots. Imaginary quantities are, however, generally reduced to one denomination as multiples of $\sqrt{-1}$, in the following manner: $\sqrt{-64} = \sqrt{64 \times -1} = \sqrt{64} \times \sqrt{-1} = 8\sqrt{-1}$; and again, $\sqrt{-18a^5} = \sqrt{9a^4 \times -2a} = \sqrt{9a^4} \times \sqrt{-2a} \times \sqrt{-1} = 3a^2\sqrt{2a}\sqrt{-1}$. These forms very frequently occur in higher algebra.

IMAGINATION. The meaning of this word enters into many relationships, and is thereby rendered difficult to define. The principal meaning is doubtless what connects it with Poetry and Fine Art, from which the other significations branch off. The simplest mode of explaining this complicated relationship will be to state in separation the different constituents of the power in question. We shall then see why and where it touches upon other faculties, which still require to be distinguished from it.

1. Imagination has for its objects the *concrete*, the real, or the individual, as opposed to abstractions and generalities, which are the matter of science. The full colouring of reality is implied in our imagination of any scene of nature. In this respect, there is something common to imagination and memory. If we endeavour to imagine a volcano, according as we succeed, we have before the mind everything that a spectator would observe on the spot. Thus, sensation, memory, and imagination alike deal with the fulness of the actual world, as opposed to the abstractions of science and the reasoning faculties.

The faculty called *conception*, in one of its meanings, has also to do with this concrete fulness, although, in what Sir William Hamilton deems the original and proper meaning of that word, this power is excluded. In popular language, and in the philosophy of Dugald Stewart, conception is applied to the case of our realising any description of actual life, as given in history or in poetry. When we completely enter into a scene portrayed by a writer or speaker, and approach the situation of the actual observer, we are often said to *conceive* what is meant, and also to imagine it; the best word for this signification probably is 'realise.'

2. It is further essential to imagination in its strictest sense that there should be some original construction, or that what is imagined should not be a mere picture of what we have seen. Creativeness, origination, invention, are names also designating the same power, and excluding mere memory, or the literal reproduction of past experience. Every artist is said to have imagination according as he can rise to new combinations or effects different from what he has found in his actual observation of nature. A literal, matter-of-fact historian would be said to be wanting in the faculty. The exact copying of nature may be very meritorious in an artist, and very agreeable as an effect, but we should not designate it by the term imagination. There are, however, in the sciences, and in all the common arts, strokes of invention and new constructions, to which it might seem at first sight unfair to refuse the term in question, if originality be a leading feature in its definition. But still we do not usually apply the term imagination to this case, and for a reason that will appear when we mention the next peculiarity attaching to the faculty.

3. Imagination has for its ruling element some *emotion* of the mind, to gratify which all its constructions are guided. Here lies the great contrast between it and the creativeness of science and mechanical invention. These last are instrumental to remote objects of convenience or pleasure. A creation of the imagination comes home at once to the mind, and has no ulterior view.

Whenever we are under the mastery of some strong emotion, the current of our thoughts is affected and coloured by that emotion; what chimes in with it is retained, and other things kept out of sight. We also form new constructions that suit the state of the moment. Thus, in fear, we are overwhelmed by objects of alarm, and even conjure up spectres that have no existence. But the highest example of all is presented to us by the constructions of fine art, which are determined by those emotions called *æsthetic*, the sense of beauty, the pleasures of taste; they are sometimes expressly styled 'pleasures of the imagination.' The artist has in himself those various sensibilities to an unusual degree, and he carves and shapes his creations with the view of gratifying them to the utmost. Thus it happens that fine art and imagination are related together, while science and useful art are connected with our reasoning faculties, which may also be faculties of invention. It is a deviation from the correct use of language, and a confounding of things essentially distinct, to say that a man of science stands in need of imagination as well as powers of reason; he needs the power of *original construction*, but his inventions are not framed to satisfy present emotions, but to be instrumental in remote ends, which in their remoteness may excite nothing that is usually understood as emotion. Every artist exercises the faculty in question, if he produces anything original in his art.

The name 'Fancy' has substantially the meanings now described, and was originally identical with imagination. It is a corruption of fantasy, from the Greek *fantasia*. It has now a shade of meaning somewhat different, being applied to those creations that are most widely removed from the world of reality. In the exercise of our imagination, we may keep close to nature, and only indulge the liberty of re-combining what we find, so as to surpass the original in some points, without forcing together what could not co-exist in reality. This is the sober style of art. But when, in order to gratify the unbounded longings of the mind, we construct a fairyland with characteristics altogether beyond what human life can furnish, we are said to enter the regions of fancy and the fantastical.

The 'ideal,' and 'ideality,' are also among the synonyms of imagination, and their usual acceptation illustrates still further the property now discussed. The 'ideal' is something that fascinates the mind, or gratifies some of our strong emotions and cravings, when reality is insufficient for that end. Desiring something to admire and love beyond what the world can supply, we strike out a combination free from the defects of common humanity, and adorned with more than human excellence. This is our 'ideal,' what satisfies our emotions, and the fact of its so doing is the determining influence in the construction of it.

IMAUM, the appellation given to the most honoured teachers of Mohammedanism. The word is Arabic, and signifies a director or teacher. It is commonly employed to designate any of the persons belonging to the Mohammedan Ulama (q.v.), or priestly body. They are distinguished from the laity by a turban somewhat higher than usual. They are held in great reverence by the people. The sultan himself has the title of Imaum, as the

spiritual chief of all Moslems. The word is sometimes incorrectly written Imaun.

IMAU. See HINDÚ-KÚSH.

IMBA'TTLED. See EMBATTLED.

IMBECILITY must not be confounded with idiocy. In the former, there is the *imperfect* development of mind; in the latter, there is the *non*-development of mind. In the feeble intellect, there may be present every faculty which distinguishes the most gigantic understanding, and these may act under ordinary laws; but they are dwarfed, incapable of continued growth and training, and are exercised and applied under the guidance and assistance of others, or of external circumstances. There are large numbers of weak-minded, useless persons in every community, who differ from the more robust intellects solely in degree. But the more marked and recognisable imbecility, as transmitted congenitally, as following dentition, chorea, convulsions, and diseases which retard vigorous bodily development, or as induced by the great constitutional changes at puberty, is characterised by all or many of the following symptoms. The expression is vacant, the senses are dull; the head is small, the body deformed; the gait is vacillating and restless; the head is pendent, thrown back, or agitated; the saliva escapes; the language is limited and infantile; the ideas are few, and consist of mere sensuous impressions; the temper is timid, facile, and vain; and the passions are little susceptible of control. The affection has been regarded as general, or involving the whole mind; or as partial, when the intellect only, or the sentiments only, or a particular faculty may be feeble and ineducable. In a legal view, such persons have been divided into those who have, and those who have not, a moral perception of right and wrong. It is, however, worthy of consideration, that while they may know right from wrong in their ordinary and habitual range of duties, and within the scope of their own capacity, they may fail to do so beyond these narrow limits, and where questions of property, propriety, or abstract justice are concerned. Many imbeciles are muscular, capable of performing acts requiring strength and endurance rather than dexterity; and in this country, as well as many others, they are not merely the 'naturals,' who run everybody's messages, but they are converted into the domestic drudges of the homestead, the white slaves of the farm. From the more clever and cunning of the class were the professional fools of former ages selected. Imbeciles are often confounded with genuine idiots, and their partial educability has exaggerated the supposed success in the attempts to elicit and mature the embryo mind. However far this training may be carried, and even when the subject has become self-maintaining, it may be safely asserted that he is never self-guiding nor self-governing, nor capable of an independent existence.—Howe, *On the Causes of Idiocy*; Reports, Idiot School, Earlswood; *De l'Idiotie chez les Enfants*, par Felix Voisin.

IMBECILITY, in point of law—i.e., something short of idiocy or lunacy—is no ground of relief in England against a contract, though relief is always granted in case of fraud, and the imbecility of one of the parties may form an element of the fraud. Nor does the law of England in any peculiar way protect an imbecile person or his property; for so long as a person is not actually insane or an idiot, he can do what he likes with his own. In Scotland, however, an imbecile person is to a certain extent protected against being imposed upon, as regards his heritable property, by a step

called interdiction, which consists in either the imbecile, who is conscious of his weakness, executing a bond of interdiction, by which he puts himself under trustees, whose consent is in future made necessary to render valid his contracts, or he may be judicially interdicted by the Court of Session, at the instance of his next of kin, with like effects. The trustees or guardians in such cases are called the interdictors. See LUNACY.

IMBER, or IMMER. See DIVER.

IMBROS, an island of the Ægean Sea, about 11 miles north-east of Lemnos, and the same distance from the mouth of the Dardanelles. It is 18 miles in length, and has an area of 116 square miles. The island is mountainous, its highest summit being 1845 feet above sea-level, and is covered with wood. Corn, wine, and cotton are abundantly grown in the valleys; oil is also produced. I. contains four villages, the chief of which, called Imbro, is built on the site of an ancient town of the same name. Pop. of entire island about 4000.

IMBRUED, or EMBRUED, an expression used in heraldry to signify bloody, or dropping with blood. Weapons thus blazoned are drawn with drops of blood falling from them.

IMERITIA, formerly an independent Transcaucasian territory, now part of the government of Kutais (q. v.), is bounded on the N. by the Caucasian mountains, and on the W. by the districts of Ghuria and Mingrelia. Area, 4040 square miles; pop. 100,000. Its history as an independent dominion commenced from about the beginning of the 15th c., and was long marked by internal dissensions. In 1745, Salomon I. was proclaimed, but his nobles revolting shortly after, and aided by the Turks, dethroned him. Salomon applied for help to Russia, and in 1769, Count Tottleben, at the head of a Russian force, entered I., restored the king, and drove back the Turks. The civil dissensions of this province, however, continued, and at last, in 1810, after having long acknowledged allegiance to Russia, it was formally incorporated in and proclaimed a province of that empire.

IMIDES. See ORGANIC BASES.

IMITATION. See SYMPATHY.

IMITATION, in the science of musical composition, is the repeating of the same passage, or the following of a passage with a similar one, in one or more of the other parts or voices, and it may be either strict or free. When the imitated passage is repeated note for note, and every interval is the same, it is called strict, and it may take place in the unison or octave, or in any other of the degrees of the scale, either above or below the original passage. The progression of a passage may also be imitated by an inversion, or by reversing the movement of the original; also by notes of a greater or of a lesser value. See DOUBLE COUNTERPOINT, FUGUE, and CANON. Imitation in composition is one of the most important means of producing unity and animation in the progression of the parts, and is used in a strict, and also in a free manner, in the instrumental works of Haydn and Beethoven, and also by Mozart in his easier operatic works. Many composers, however, resort to imitation improperly, and generally from poverty of musical ideas, or from pedantry. No fixed rules can be given for its use.

IMITATIVE INSANITY. There are many mental diseases, especially those marked by grotesque external manifestations, by gesticulations, and convulsive seizures, which appear to be propagated

by imitation. In the healthy and naturally constituted, there exists a tendency to copy and reproduce, or represent what powerfully impresses the imagination; and during the excitement of individuals or communities, this inclination is more influential, and passes beyond the control of the will. Great caution, however, must be exercised in distinguishing between what is epidemic and depends upon atmospheric or external moral causes, from the results of strong or morbid states of the mind itself. An idiot is mentioned by Gall, who, having seen the slaughter of a pig, killed a man after the same fashion. A child of seven years old suffocated a younger brother on the suggestion of the strangling of Punch at the hands of the devil. The example of suicide by hanging having been set by a pensioner in the Hôpital des Invalides, six similar deaths followed, and by suspension from the same lamp-post. After the return of the Bourbons, there appeared in succession seven female claimants to the parentage of Marie Antoinette; and pyromania, propagated by sympathy, is well known to have existed in Normandy in 1830.

IMMACULATE CONCEPTION OF THE BLESSED VIRGIN MARY, FEAST OF, a festival celebrated on the 8th of December in the Latin, and on the 9th in the Greek Church, in which latter church it is held under the name of 'The Conception of St Anne,' the mother of the Virgin Mary. The festival of the Conception itself is traceable in the Greek Church from the end of the 5th c., and in the Latin dates from the 7th; but a great controversy prevailed for a long time in the West as to whether and in what sense the conception of the Blessed Virgin Mary was to be held immaculate, and in what sense the Blessed Virgin herself was to be held conceived without sin. It was believed to be a consequence of the doctrine of the divine maternity, and a necessary part of the honour due to the Incarnation, that the Blessed Mother should be held to have been at all times free from the stain of sin. This might have been, either by her having been, like the prophet Jeremiah (Jer. i. 6), or the Baptist St John (Luke, i. 35), sanctified before her birth—that is, purified in her mother's womb from the stain of original sin; or by the still higher sanctification of having been entirely exempted from the stain of sin, either—for the discussion was carried to all these subtleties—before the formation of the embryo in the womb of her mother, or at least before its animation by union with the soul. The actual controversy in the West may be said to have commenced with St Bernard, who not only remonstrated with the canons of Lyon in 1131 for their unauthorised introduction of this festival in their cathedral, but rejected the opinion of the Blessed Virgin's having been conceived free from original sin, though he admitted her sanctification in her mother's womb (*Epist. 174, Ad Canon. Lugdunensis*). The discussion thus raised led to a protracted controversy in the schools. The great master of scholastic subtlety, John Duns Scotus, in a disputation held before the university of Paris in 1307, maintained the doctrine of the immaculate conception in its highest sense; and the entire order to which he belonged, the Franciscan, as well as the school to which he has given his name, the Scotists, afterwards zealously defended it. On the other hand, the Thomist school, which was that of the Dominican order, having denied the immaculate conception, much division for a time existed; but the prevailing tendency was at all times towards the Scotist opinion. The university of Paris, in 1387, condemned the Thomist doctrine. The council of Basel—although, it is true, at the time when

it was in conflict with the pope—declared the doctrine of the immaculate conception to be a Catholic dogma, and reprobated in the strongest terms the opposite opinion. Sixtus IV., however, imposed on the defenders of both opinions, in 1470, the obligation of mutual toleration and charity, and renewed this constitution in 1483; but in the end of the same century the university of Paris required, as a condition of the doctorate, an oath on the part of the candidate that he would defend the dogma of the immaculate conception. The Council of Trent, without discussing the scholastic dispute, merely declared that 'in its decree on original sin it did not comprehend the blessed and immaculate Virgin Mary,' and renewed the constitution of Sixtus IV. already referred to. This abstinence on the part of the council led to a further renewal of the dispute, which reached such a pitch towards the close of the 16th c., that Pius V. not only prohibited either side from stigmatising the opposite with the name of heretical, but forbade all public discussions of the subject, except in theological disputations in the presence of a learned auditory. In the pontificates of Paul V. and Gregory XV., earnest instances were made by the Spanish crown to obtain a definite declaration in favour of the doctrine of the immaculate conception; but the pope again refused, contenting himself with repeating the constitution of Sixtus IV. He added, however, certain new provisions: 1. That disputants, in asserting the doctrine of the immaculate conception, should abstain from assailing the opposite doctrine. 2. That no one except the members of the Dominican order, and others specially privileged, should presume to defend, even in private disputation, the doctrine that the Blessed Virgin Mary was conceived in original sin. 3. That, nevertheless, in the public mass or office of the church, no one should introduce into the prayers or other formularies any other word than simply *conceptio*, without adding any epithet involving either doctrine. At the same time, opinion was setting steadily in favour of the doctrine of the immaculate conception. Alexander VII., and afterwards Clement IX., added new solemnity to the festival. Clement XI. ordained that it should be observed as a holiday of obligation, and at length Gregory XVI. permitted that the epithet immaculate should be introduced into the public service. In the end, at the instance of bishops in various parts of the church, the present pope, Pius IX., addressed a circular to the bishops of each nation, calling for their opinion, and that of their people, as to the faith of the church on the point; and on the receipt of replies all but absolutely unanimous, he issued a solemn decree at Rome, in a numerous council of bishops, on the 8th December 1854, declaring the doctrine to be an article of Catholic belief, and proposing it as such to the universal church. This decree has been implicitly accepted throughout the Roman Church.

IMMORALITY, in point of law, is a good defence to actions and suits, but it must be some immorality which runs counter to the well-known policy of the law. Thus, for example, if a man gave a bond, or granted a deed, giving to a woman some annuity, with a view to induce her to live in concubinage, this would be a good defence against the bond or deed being enforced, for the law discountenances his conduct; whereas, if it were merely a bond, or a gift, in consideration of something of the same kind past and ended, the deed would be good. So the keeper of a house of ill-fame is not allowed to sue, and has no legal remedy against her guests for any sum agreed to be paid for immoral purposes. In most other respects, the mere personal

immorality of the parties who are litigants makes no difference whatever as to their respective remedies, for the law protects the bad as well as the good, the unjust as well as the just.

IMMORTALITY is the continued existence of the human soul in a future and invisible state. 'If a man die, shall he live again?' is a question which has naturally agitated the heart and stimulated the intellectual curiosity of man, wherever he has risen above a state of barbarism, and commenced to exercise his intellect at all. The religion of all civilised peoples may be said more or less to recognise the affirmative of the question,* although often under very vague and materialistic forms. In the ancient Egyptian religion, the idea of immortality first assumes a definite shape. There is a clear recognition of a dwelling-place of the dead and of a future judgment. Osiris, the beneficent god, judges the dead, and 'having weighed their heart in the scales of justice, he sends the wicked to regions of darkness, while the just are sent to dwell with the god of light.' The latter, we read on an inscription, 'found favour before the great God; they dwell in glory, where they live a heavenly life; the bodies they have quitted will for ever repose in their tombs, whilst they rejoice in the life of the supreme God.' Immortality is plainly taught, but bound up with the idea of the preservation of the body, to which the Egyptians attached great importance, as a condition of the soul's continued life; and hence they built vast tombs, and embalmed their bodies, as if to last for ever. In the Zoroastrian religion, the future world, with its governing spirits, plays a prominent part. Under Ormuz and Ahriman, there are ranged regular hierarchies of spirits engaged in a perpetual conflict; and the soul passes into the kingdom of light or of darkness, over which these spirits respectively preside, according as it has lived on the earth well or ill. Whoever has lived in purity, and has not suffered the *diws* (evil spirits) to have any power over him, passes after death into the realms of light. In the early Grecian paganism, Hades, or the realms of the dead, is the emblem of gloom to the Hellenic imagination. 'Achilles, the ideal hero, declares that he would rather till the ground than live in pale Elysium.' This melancholy view of the future everywhere pervades the Homeric religion. With the progress of Hellenic thought, a higher idea of the future is found to characterise both the poetry and philosophy of Greece, till, in the Platonic Socrates, the conception of immortality shines forth with a clearness and precision truly impressive. In the *Apology* and the *Phædo*, Socrates discourses of the doctrine of the soul's immortality, in language at once rich in faith and in beauty. 'The soul, the immaterial part, being of a nature so superior to the body, can it,' he asks in the *Phædo*, 'as soon as it is separated from the body, be dispersed into nothing, and perish? Oh, far otherwise. Rather will this be the result. If it take its departure in a state of purity, not carrying with it any clinging impurities of the body, impurities which during life it never willingly shared in, but always avoided, gathering itself into itself, and making the separation from the body its aim and study—that is, devoting itself to true philosophy, and studying how to die calmly; for this is true philosophy, is it

not?—well, then, so prepared, the soul departs into that invisible region which is of its own nature, the region of the divine, the immortal, the wise, and then its lot is to be happy in a state in which it is freed from fears and wild desires, and the other evils of humanity, and spends the rest of its existence with the gods.'

It is only in Christianity, however, that this higher life is clearly revealed as a reward not merely to the true philosopher, but to every humble and pious soul. Christ 'hath brought life and immortality to light by the gospel.' 'According to his abundant mercy, God hath begotten us again unto a lively hope by the resurrection of Jesus Christ from the dead, to an inheritance incorruptible and undefiled, and that fadeeth not away, reserved in heaven.' It is undoubtedly owing to Christianity that the doctrine of the soul's immortality has become a common and well-recognised truth—no mere result of speculation, nor product of priestly invention—but a light to the reason, and a guide to the conscience and conduct. The aspirations of philosophy, and the conceptions of mythology, are found in the gospel transmuted into an authoritative influence, governing and directing the present life.

IMMORTELLES. See EVERLASTING FLOWER.

IMO/LA (anc. Forum Corneli, or Forum Syllæ), a town of Italy, in the legation of Ravenna, stands in a fruitful plain adjoining picturesque hills, close to the river Santerno, and 24 miles west-south-west of Ravenna. It contains some fine palaces, churches, theatres, and benevolent institutions. I. possesses some good manufactures of wax, oil, majolica, silk, and glass, besides extensive leather-curing establishments, and brick and tile works. From a species of white grape grown in the vicinity, the delicious wine known as *vin santo* is manufactured. Pop. upwards of 10,000.

IMPA/LE, in Heraldry, to arrange two coats of arms side by side in one shield divided per pale. It is usual thus to exhibit the conjoined coats of husband and wife, the husband's arms occupying the dexter side or place of honour, and the wife's the sinister side of the escutcheon. When a man marries a second wife, heralds say that he may divide the sinister half of the shield per fess into two compartments, placing the family arms of his deceased wife in chief, and of his second wife in base. A husband impaling his wife's coat with his own, is not allowed to surround the former with the collar or insignia of any order of knighthood to which he may belong. Bishops, deans, heads of colleges, and kings-of-arms, impale their arms with their insignia of office, giving the dexter side to the former. In early heraldry, when two coats were represented in one shield side by side, only half of each was exhibited, an arrangement which has been called *dimidiation*. Sometimes the one coat only was dimidiated. A reminiscence of dimidiation is preserved in the practice of omitting bordures, orles, and tressures in impaled arms on the side bounded by the line of impalement.

Impale.

IMPANATION (Lat. *in*, and *panis*, bread), a technical word employed in the Eucharistic controversies to express the peculiar opinion propounded by Luther as to the nature of the presence of Christ in the Eucharist. Differing from the Roman Catholics in denying the transubstantiation of the bread and wine, and from the Sacramentarians in denying that our Lord's presence was merely typical or figurative, Luther contended that the

* Some of the most widely spread forms of belief in the world would seem to be exceptions to this statement; for in Hinduism the goal sought is absorption into the Universal Spirit, and therefore loss of individual existence; while the pious Buddhist strives for *Nirvana*, or complete extinction. Yet even here the belief in a future life exists in the form of the Transmigration of Souls (q. v.).

body and blood of Christ were present in, or along with, the elements of bread and wine; in a manner analogous to that in which the divinity of Christ co-exists in the same person with his human nature. Hence, by an analogy with the word incarnation, he devised for the Eucharistic union the term impanation. This doctrine was the subject of a lengthened controversy with Zwingli at Marburg in 1529, which left each party unconvinced; and this theory still continues to be the received one in the orthodox Lutheran schools.

IMPEACHMENT, the name given to an accusation and trial of a peer or member of parliament, or, indeed, any other person, before the High Court of Parliament, for treason, or some high crime or misdemeanour. This is a kind of trial which is reserved for great and enormous offenders, particularly in matters affecting the constitution, for the ordinary tribunals generally suffice for all cases of crimes. Impeachment, accordingly, is of rare occurrence, the last instance being that of Lord Melville in 1805; but as it is one of the high prerogatives of parliament to try offenders in this way, it is still competent to use it. The proceedings nearly resemble an ordinary trial at law. A pardon by the crown is not pleadable in bar of the prosecution, though, after sentence, the crown may pardon the offender. See May, *On Parliaments*.

IMPEACHMENT OF WASTE, an expression in English Law, used in deeds or wills. When an estate is given to a person for life, or for a term of years, *without impeachment of waste*, the tenant is entitled to cut timber, and do many things on the estate which otherwise he would be unable to do. Still, he is not allowed to do what he likes, for if he abuses his power, and attempts to cut down ornamental timber, for example, or deface the family mansion, the Court of Chancery will interfere by injunction to prevent this. The phrase is not used in Scotland, but the law is not materially different.

IMPENETRABILITY, one of the essential properties of matter, implies that no two bodies can at the same time occupy the same space. If a nail be driven into a piece of wood, it does not, properly speaking, *penetrate* the wood, for the fibres are driven aside before the nail can enter. If a vessel be filled with fluid, and a solid body be then placed in it, as much water will run over as is equal in bulk to the solid body, in this way making room for it. The lightest gases are really as impenetrable as the densest solid; although, owing to their compressibility, it is not readily made apparent.

IMPERATIVE, CATEGORICAL. According to Kant (q. v.), man, in the consciousness of his moral liberty, recognises two great laws regulating his will; the first prompts him to seek his own well-being, the second *commands* him to be virtuous, even at the sacrifice of that. From this opposition in his moral nature between desire and conscience, springs up the idea of duty, which, in the Kantian terminology, is called the 'moral imperative,' to which Kant adds the epithet *categorical*, to indicate that its commands are absolute and unconditional.

IMPERIAL CROWN properly signifies the crown borne by the German emperor; in form, a circle of gold, adorned with precious stones and *fleurs-de-lis*, bordered and seeded with pearls, and raised in the form of a cap voided at the top like a crescent. From the middle of the cap rises an arched fillet enriched with pearls, and surmounted by a globe, on which is a cross of pearls. In English

Heraldry, the form of crown worn by the kings of England (see KING) is sometimes called a crown

Imperial Crown.

imperial; and a charge, crest, or supporter, crowned with a regal crown, is said to be *imperially* crowned.

IMPERIUM is a word used in the Roman law in various senses, the most important of which is that which it bears when applied to consuls and proconsuls—thence called *imperatores*. Most of the superior magistrates were also intrusted with the *imperium*, which meant a sovereign authority. It is of very little practical importance in modern times to trace the extent or precise nature of the authority thus designated, as the subject has no bearing on modern law.

IMPERTINENCE, in English Law, means some irrelevant matter introduced in an affidavit or pleading; and the court will generally order it to be struck out, and the offending party to pay the costs of doing so.

IMPETIGO, a disease of the skin. It consists of crops of pustules, which may either be scattered or collected in groups. These pustules burst, dry up, and become covered with scabs or crusts of a yellow colour, not unlike little masses of candied honey. From beneath these crusts, a purulent discharge commonly takes place; the crusts become thicker and larger, and the skin around and beneath them is red and raw. The disease may be either acute or chronic. In the former case, it is attended with febrile symptoms, which must be combated by the internal administration of purgatives and alkalies, strict attention to diet, and weak alkaline lotions. In chronic cases, the discharge may be checked by a lotion containing ten or fifteen grains of oxide of zinc in an ounce of rose-water.

There are various forms of this complaint, as *I. figurata*, *I. sparsa*, &c. The disease known as *Crustea lactea*, which sometimes covers the faces of children like a mask, is a sort of compound of

impetigo and eczema; and the rose-water lotion already mentioned is a useful application for it.

IMPEYAN, or **IMPEYAN PHEASANT** (*Lophophorus Impeyanus*), a large gallinaceous bird of the family *Phasianidae*, a native of high cold regions of the Himalaya, but remarkable as much as any tropical bird for the splendour of its plumage, enhanced by the changing metallic tints which it

Impeyan (*Lophophorus Impeyanus*).

exhibits—green, steel-blue, violet, and golden bronze. The fine plumage, however, belongs to the male alone. The female is clothed in sober brown, mottled with gray and yellow, and is smaller than the male. The I. has been found capable of domestication, and may probably be found capable of naturalisation, in Britain. It derives its name from Lady Impey, who first attempted to bring it alive to Britain, but failed. The Nepaulese name, *Monaul*, signifies *Bird of Gold*.

IMPLEMENT, in Scotch Law, means fulfilment of a contract or decree of the court.

IMPLEMENTS, AGRICULTURAL. Under this term are generally comprehended not only the implements used in the actual cultivation of the soil, but those requisite for other operations of farming, and for the preparation of the produce of the land for use, in so far as it is ordinarily carried on by the farmer. The first implements for the cultivation of the ground were doubtless such as could be used by man's unaided strength, and many such are still in use, as the spade, the hoe, the fork, and the shovel. When animals were reduced to the service of man, the plough appeared in its first rude form. Grubbers, cultivators, &c., are recent inventions; rollers are more ancient. Sowing machines or drills are modern, but the harrow is ancient, although branches of trees drawn along the newly sown land, long served the purpose of its now carefully adjusted tines.—The necessity of irrigation in some countries early led to expedients and implements for accomplishing it. The Egyptian *shadoof* is figured in the article **AGRICULTURE**.—**Implements** for clearing the ground of weeds, for occasional stirring of the ground whilst under crop, and for *earthing up* crops, are all, except the hoe, of comparatively recent invention. The *soythe* and *sickle* have existed from remote antiquity, although the reaping-machine is a novelty only beginning to assume a very important place. Wheel-carriages of various descriptions and for various purposes must be mentioned among agricultural implements; also implements for thrashing and winnowing corn, for

scutching and breaking flax, for ginning cotton, for crushing sugar-cane and evaporating its juice, &c. The preparation of the produce of different plants requires implements of different kinds. Others are required in the care of cattle, and for the Dairy (q. v.). The principal agricultural implements are noticed in separate articles, and some in connection with particular kinds of cultivated plants.

IMPLUVIUM, a tank or cistern in the centre of the hall or Atrium (q. v.) of a Roman house. In the examples which remain at Pompeii, the impluvium is generally formed of marble. It is placed immediately under the unroofed part of the atrium, and is intended to receive the rain which runs down from the roof through the opening. The impluvium was frequently adorned with fountains, and formed a very peculiar and interesting feature in the dwellings of the Romans.

IMPOUNDERABLE SUBSTANCES, an epithet applied to light, heat, electricity, and magnetism, at a time when they were universally considered as matter, in contradistinction to those substances which possessed sensible weight. See **HEAT**.

IMPORTS AND EXPORTS. See **BALANCE OF TRADE**.

IMPOST, the point where an arch rests on a wall or column. It is usually marked by horizontal mouldings, but sometimes these are absent, especially in Gothic architecture, where different forms of impost are used. These have been classed by Professor Willis as—1st, 'the *continuous* impost,' where the arch mouldings are carried down the pier; 2d, 'the *discontinuous* impost,' where the arch mouldings about and are stopped on the pier; 3d, 'the *shafted* impost,' where the arch mouldings spring from a capital, and are different from those of the pier—the form used in the best Gothic; 4th, 'the *banded* impost,' where the pier and arch have the same mouldings; but the impost is marked by a band of horizontal mouldings, as is frequently the case in Italian-Gothic buildings. These simple forms of impost are sometimes used together, so as to produce more complex combinations.

IMPOTENCY, in Law, is a good ground for either of two married parties annulling the marriage, if the impotency existed at the time the contract was entered into. The defect must be proved. The law is uniform in the United Kingdom.

IMPOUNDING A DOCUMENT occurs where a document is produced in course of a trial or hearing before a court or judge, who, instead of giving it up to the owner, retains it, in order to enable a prosecution to be brought if necessary.

IMPOUNDING CATTLE is, in English Law, the remedy given to all occupiers of land against the cattle of strangers which stray on such land. It amounts, in fact, to taking and keeping the cattle as a security for the damage which has been done. The occupier is then said to *distrain* the cattle *damage feasant*. This he does by seizing and driving them to the nearest pound, if there is one within three miles—i. e., an enclosed place kept for the purpose—or he may put them in premises of his own. In either case, he is bound to feed and water the cattle at the expense of the owner of such stray cattle, who can only recover them back by paying these expenses and the damage done, or on giving security, and bringing an action of *Replevin* (q. v.) to try the right. The cattle cannot be distrained unless they are at the time actually trespassing upon the land. In Scotland, a similar right exists, called the *poinding* of stray cattle.

IMPRESSMENT was once the mode formerly resorted to of manning the British navy. The

practice had not only the sanction of custom, but the force of law, for many acts of parliament, from the reign of Philip and Mary to that of George III., had been passed to regulate the system of impressment. Impressment consisted in seizing by force, for service in the royal navy, seamen, river-watermen, and at times landsmen, when state emergencies rendered them necessary. An armed party of reliable men, commanded by officers, usually proceeded to such houses in the seaport towns as were supposed to be the resort of the seafaring population, laid violent hands on all eligible men, and conveyed them forcibly to the ships of war in the harbour. As it was not in the nature of sailors to yield without a struggle, many terrible fights took place between the press-gangs and their intended victims—combats in which lives were often lost. In point of justice, there is little, if anything, to be said for impressment, which had not even the merit of an impartial selection from the whole available population.

In recent times, when volunteers fail, a system of Bounties (q.v.) has been resorted to; and it is not very probable that recourse will be again had to impressment. At the same time, the laws sanctioning it slumber, without being repealed.

Under the laws, all eligible men of seafaring habits are liable between the ages of 18 and 55; but exemptions are made in favour of apprentices who have not been two years apprenticed, fishermen at sea, a proportion of able seamen in each collier, harpooners in whalers, and a few others. A press-gang could board a merchant-vessel or a privateer of its own nation in any part of the world, and carry off as many of the best men as could be removed without actually endangering the vessel. The exercise of this power made a privateer dread a friendly man-of-war more than an enemy, and often led to as exciting a chase as when enemies were in pursuit of each other; for the privateer's men were the best sailors, for their purpose, the naval officers could lay hold on.

IMPRISONMENT. The power of imprisonment for non-payment of debt, as well as by way of punishment for crime, has always been held to be inherent in courts of justice. In criminal proceedings also, a person may, by a warrant of a justice of peace, be imprisoned before trial, provided the justice considers it is not a proper case for allowing bail; and as a general rule, though in minor offences an accused person may insist on being discharged on tendering sufficient bail, yet in more serious crimes it is always in the discretion of the justice to accept or refuse the bail tendered, and on his refusal, application may be made to judges of the common law courts to accept bail. As regards imprisonment for debt, it is now competent only in cases where judgment has been obtained, and the debt is £20 or upwards. In one case, however, and one only, a person may be imprisoned before judgment has been obtained—viz., where he is about to leave the kingdom. In such a case, the creditor requires to make an affidavit of the debt or cause of action before a judge, and may obtain a *capias* to arrest the defendant, who will not be released, except on bail, until judgment is obtained. With regard to debts under £20, which are generally sued for in England in the county court, though the defendant cannot be imprisoned on a judgment for less than that amount, yet if he wilfully disobey the judgment of the court, which ordered him to pay by instalments or on a time certain, and if the debt was originally contracted by means of fraud, the judge can commit him for contempt, and thus imprison him on another ground. In cases of insolvency, if a person allow himself to

be taken to prison for debt, and remain in prison for fourteen days if a trader, or two months if a non-trader, this is an act of bankruptcy, and he may be adjudicated a bankrupt, and his estate distributed in the usual way by the Court of Bankruptcy. But in general if a person wishes to be made a bankrupt, he can become so without the necessity of being imprisoned. It is also a doctrine of the law of England, that if a debtor is once imprisoned for debt, it operates as complete satisfaction, and his land or goods cannot in that case be taken. But the debtor can only get out of prison through the intervention of the Bankruptcy Court, which requires him to give up everything to the creditors.

In Scotland, imprisonment for debt is also competent on similar principles; and it is competent to imprison a debtor if the debt exceed £8, 6s. 8d. An absconding debtor may also be arrested if *in meditatione fuge*—i.e., about to leave the country, in which case bail or caution is required. In Scotland, imprisonment for debt is not considered satisfaction of the debt, and the creditor may at the same time pounce his goods and adjudge his land, and take other concurrent remedies.

IMPROBATION, a Scotch law-term, meaning the disproving or setting aside a deed on the ground of falsehood or forgery.

IMPRO'MPTU, in Music, a short extemporaneous composition. See also **FANTASIA**.

IMPROPRIATION, the transfer to a layman of the revenues of a benefice to which the cure of souls is annexed, with an obligation to provide for the performance of the spiritual duties attached to the benefice. The practice of *impropriation* differs from the somewhat similar but more ancient usage of *appropriation*, inasmuch as the latter supposes the revenues of the appropriated benefice to be transferred to ecclesiastical or quasi-ecclesiastical persons or bodies, as to a certain dignitary in a convent, a college, a hospital; while *impropriation* implies that the temporalities of the benefice are enjoyed by a layman; the name, according to Spelman, being given in consequence of their thus being *improperly* applied, or diverted from their legitimate use. The practice of *impropriation*, and still more that of *appropriation*, as in the case of monasteries, &c., and other religious houses, prevailed extensively in England before the Reformation; and on the suppression of the monasteries, all such rights were (by 27 Henry VIII. c. 28, and 31 Henry VIII. c. 13) vested in the crown, and were by the crown freely transferred to laymen, to whose heirs have thus descended not only the right to tithes, but also in many cases the entire property of rectories. The spiritual duties of such rectories are discharged by a clergyman, who is called a vicar, and who receives a certain portion of the emoluments of the living, generally consisting of a part of the glebe-land of the parsonage, together with what are called the 'small tithes' of the parish.

IMPROVING LEASE, a lease, in Scotland, by which the tenant undertakes to keep the premises in repair; called a repairing lease in England.

IMPROVISATORI, an Italian term, designating poets who utter verses without previous preparation on a given theme, and who sometimes sing and accompany their voice with a musical instrument. The talent of improvisation is found in races in which the imagination is more than usually lively, as in the Arabs, and in many tribes of negroes. Amongst the ancients, Greece was the land of improvisation. In modern Europe, it has been almost entirely confined to Italy, where Petrarch, in the 12th c., introduced the practice of singing improvised verses to the lute; and down to the

present day, the performances of improvisatori constitute one of the favourite entertainments of the Italians. Females (*improvisatrici*) have frequently exhibited this talent in a high degree. Improvisation is by no means limited to brief poems of a few verses and of very simple structure, but is often carried on with great art, and in the form and to the length of a tragedy or almost of an epic poem. But when the productions of the most admired improvisatori have been given to the world through the press, they have never been found to rise above mere mediocrity. It is worthy of notice that the greater number of the celebrated improvisatori of Italy have been born in Tuscany or the Venetian territories. Siena and Verona have been especially productive of them. Some of the principal are, Serafino d'Aquila (died 1500), Metastasio (q. v.), who soon abandoned the art, Zucco (died 1764), Serio and Rossi (beheaded at Naples, 1799), Gianni (pensioned by Bonaparte), and Tommaso Sgricci (died 1836). The best-known *improvisatrici* are Magdalena Moralli Fernandez (died 1800), Teresa Bandettini (born 1756), Rosa Taddei (born 1801), and Signora Mazzei, the last of whom is probably the first in point of talent.

IMPULSIVE MADNESS. The approaches of mental disease are generally slow and perceptible; but instances occur where, without announcement, without any preliminary stage of disease or disturbance, an individual, apparently hitherto of sound mind, is suddenly seized with mania, presents symptoms of uncontrollable violence, perpetrates acts of atrocity or absurdity, altogether inconsistent with his previous disposition and deportment; and then, nearly as quickly, subsides into his ordinary state and habits, retaining no, or a very imperfect, recollection of the events which occurred during the paroxysm. It is not, however, in the suddenness or shortness of the paroxysm that the essential characteristic consists. During the continuance of such an affection, three mental conditions are distinctly traced: 1. The sudden birth and irresistible dominion of a propensity; 2. The abolition or impairment of the apprehension of the real and ordinary relations of the individual; and 3. The suspension of the powers by which such propulsions are prevented from arising, or ruled and regulated when they do arise. Alienation of this kind has been chiefly recognised when the instincts are involved; and the most striking illustrations are derived from cases of homicidal or sanguinary tendency, simply because the results may convulse society, or come under the notice of courts of law. But many examples exist of brief periods of aberration which could not be instigated by passion, and involved nothing criminal. A lady is mentioned who never entered church but she was impelled to shriek, or saw plate-glass but she was impelled to break it; and the incongruous laughter, the grotesque gesticulations, and the involuntary and repulsive associations to which good and great men have been subject, must all be placed under this category.

Marc, *De la Folie considérée dans ses Rapports avec les Questions Médico Judiciaires*, t. i. p. 219, and t. ii. p. 473.

IMPUTATION is one of the most common technical expressions in Christian theology. It is meant to denote the transference of guilt or of merit of punishment or reward. The doctrine of the imputation of sin, for example, is the doctrine which inculcates that all mankind are sharers in the fact and consequences of Adam's fall from innocence; and the correlative doctrine of the imputation of Christ's righteousness is that which inculcates that the merit or righteousness of Christ

is transferred to those who believe in Him, or, in other words, that they become sharers in His merit or righteousness. This idea of transference of intercommunication of good and evil, is a pervading one in Christian theology, and answers to undoubted realities of the spiritual life; but the idea is also apt to become degraded and materialised, and has become so in some of its common representations in popular theology. The doctrine of the imputation of Adam's sin, for example, expresses to some minds not only the idea of the participation of the human race in the consequences of Adam's transgression, so that, because he sinned and fell from innocence, they, the inheritors of his corrupt nature, also sin, and are involved in the miseries of a sinful state; but, moreover, the idea, that the sin of Adam in its direct guilt and wickedness is transferred to his posterity. They reason after this manner: it is undeniable that man suffers on account of original sin; but suffering and sin are inseparably connected. If man suffers on account of original sin, therefore, it is only because he is guilty of it. The sin of Adam in eating the forbidden fruit is equally the sin of his posterity. According to this mode of reasoning, there is a formal imputation of the sin of Adam to all his descendants. God is supposed, as it were, to charge the one to the account of the other, and by a direct and arbitrary act, to hold mankind guilty because Adam fell. To give a logical justification to this view, it is assumed that God entered into a covenant with Adam (see COVENANT), by which the latter was regarded as a representative of the whole human race; so that when he fell, all mankind sinned and fell with him. In the same manner, the merit or righteousness of Christ is supposed to be *imputed* to believers by a direct and formal transference of the one to the account of the other. In both cases, it is the idea of formal and arbitrary exchange that is prominent; and according to some theologians, this idea alone answers to *imputation* of sin or of righteousness. To *impute* sin, is to deal with a *man as a sinner*, not on account of his own act, or at least not primarily on this account, but on account of the act of another; and to *impute* righteousness, is to deal with man as righteous, not because *he is so*, but on account of the righteousness of Christ *reckoned as his*, and received by faith alone. The act of another stands in both cases for our own act, and we are adjudged—in the one case condemned, in the other acquitted—not for what we ourselves have done, but for what another has done for us.

This is a fair illustration of the tyranny which technical phrases are apt to exercise in theology as in other things. When men coin an imperfect phrase to express a spiritual reality, the reality is apt to be forgotten in the phrase, and men play with the latter as a logical counter, having a force and meaning of its own. *Imputation of sin* and *imputation of righteousness* have in this way come to represent legal or pseudo-legal processes in theology, through the working out of the mere legal analogies suggested by the word. But the real spiritual reality which lies behind the phrases in both cases is simple enough. *Imputation of sin* is, and can be nothing else than the expression of the spiritual unity of Adam and his race. Adam 'being the root of all mankind,' the stock which has grown from this root must share in its degeneracy. The law of spiritual life, of historical continuity, implies this, and it requires no arbitrary or legal process, therefore, to account for the sinfulness of mankind as derived from a sinful source. We are sinners because Adam fell. The fountain having become polluted, the stream is polluted. We are involved in his guilt, and could not help being so,

by the conditions of our historical existence ; but, nevertheless, his sin is not our sin, and cannot in the strict sense be imputed to us, for sin is essentially voluntary in every case—an act of self-will, and not a mere quality of nature ; and my sin, therefore, cannot be another's, nor another's mine. In the same manner, the highest meaning of the imputation of the righteousness of Christ lies in the spiritual unity of the believer with Christ, so that he is one with Christ, and Christ one with him, and in a true sense he becomes a partaker of the divine nature. The notion of legal transference is an after-thought—the invention of polemical logic—and the fact itself is deeper and truer than the phrase that covers it. *The race one with Adam, the believer one with Christ*, are the ideas that are really true in the phrases *imputation of sin and imputation of righteousness*. The logic of theology has evolved many more applications of the phrases, but these applications are rather the refinements of theological pedantry than the expression of true spiritual relations.

IN ARTICULO MORTIS, a phrase used in Scotland to denote a deed executed on death-bed. As a general rule, such a deed, in Scotland, operating like a will, may be set aside by the heir-at-law. But a will in England having the same effect cannot be set aside on that ground.

INA'GUA, GREAT and LITTLE, are the two most southerly islands of the Bahama group, the former of which, measuring fifty miles by twenty-five, is remarkable for having its longer dimension placed almost at right angles to those of the rest of the cluster. The Little I. lies about twelve miles north, and measures eight miles by six. In 1851, the population of both islands together was 530, of whom 54 were white.

INANITION. See STARVATION.

IN'ARCHING, or GRAFTING BY APPROACH, a mode of grafting by which branches are united together before any of them is separated from its original stem. Branches growing across one another sometimes unite in this way of themselves, and it is supposed—not improbably—that an observation of this circumstance first led to the invention of grafting. Inarching is practised in cases in which the ordinary modes of grafting are not found readily to succeed, as with camellias. The stocks to be grafted upon are planted, or placed in pots, around the plant from which the grafts are to be taken. Four or five months are generally sufficient to complete the union, but sometimes even

one another pretty exactly, and they are then firmly tied together, and so covered that neither air nor water may penetrate. It is desirable that they be branches of nearly the same thickness. They should be cut almost down to the pith, but the pith must not be injured. Inarching is performed in spring, after the sap has begun to circulate. The accompanying figure illustrates several ways of inarching. For example, two branches of a tree, *a*, may be bent so as to meet and strike upon a wound in the main stem, by which a gap will be filled up ; one growing tree, *b*, either from the ground or a pot, may be led to unite with another ; or several suckers, *c*, may be led from the ground archwise to strike upon a point in the stem, thus bringing fresh aid to the productive part of the tree. By means such as these, quickset-hedges are sometimes thickened like a network, so as greatly to improve their appearance and protective qualities.

IN CÆNA DO'MINI, a celebrated papal bull, so called from the ancient day of its annual publication, Holy Thursday. It is not, as other bulls, the work of a single pope, but with additions and modifications at various times, dates back from the middle ages ; some writers tracing it to Martin V., others to Clement V., and some to Boniface VIII. Its present form, however, it received from the popes Julius II., Paul III., and finally Urban VIII., in 1627, from which year it continued for a century and a half to be published annually on Holy Thursday. The contents of this bull have been a fertile subject of controversy. It may be briefly described as a summary of ecclesiastical censures, especially of those with which grievous violation of the faith of the church, or of the rights of the church or of the Roman see, are visited ; excommunication being denounced against heresy, schism, sacrilege, usurpation of the rights of the church or of the pope, forcible and unlawful seizure of church property, personal violence against ecclesiastics, unlawful interruption of the free intercourse of the faithful with Rome, &c. The bull, however, although mainly dealing with offences against the church, also denounces under similar censures other crimes, as piracy, plunder of shipwrecked goods, forgery, &c. This bull, being regarded by most of the crowned heads of Europe as an infringement of their rights, encountered in the 17th c. the determined opposition of nearly all the courts, even the most Catholic ; and at length, in 1770, Clement XIV. discontinued its publication, which has never since been renewed.

INCANTATION, like *enchant*, is derived from a Latin root meaning simply 'to sing,' as *charm* is only a disguised form of *carmen*, a song. It is the term in use to denote one of the most powerful and awe-inspiring modes of Magic (q. v.), viz., that resting on a belief in the mysterious power of words solemnly conceived and passionately uttered.

There is in the human voice, especially in its more lofty tones, an actual power of a very wonderful kind to stir men's hearts. When to this we add that poetic utterance is a special and exceptional gift ; that the language of primitive nations is crude and unmanageable, the words being as difficult to weld together as pieces of cast iron ; that it is only when the poet's mind has risen to unusual heat that he can fuse them into those rhythmical sequences that please the ear and hang together in the memory ; that, in short, his art is a mystery to himself—an inspiration ; we need not wonder at the feeling with which everything in the form of verse or metre was viewed.

The singing or saying of such compositions, which could thus stir the blood of the hearers, they knew not how, what other effects might it not produce ?

two years are necessary. When the union is complete, the scion is separated by a sloping cut from its parent plant. Care must always be taken that the parts to be joined together be cut so as to fit

Accordingly, there is no end to the power ascribed to incantations, especially when accompanied, as they generally were, with the concocting of drugs and other magical rites. They could heal or kill. If they could not raise from the dead, they could make the dead speak, or 'call up spirits from the vasty deep,' in order to unveil the future. They could extinguish fire; darken the sun or moon; make fetters burst, a door or a mountain fly open; blunt a sword; make a limb powerless; destroy a crop, or charm it away into another's barn.

The prayers of heathens, whether for blessings or for curses, partake largely of the nature of magical incantations. They are not supposed to act as petitions addressed to a free agent, but by an inherent force which even the gods cannot resist. This notion is very prominent in Hinduism and Buddhism; but it more or less disguisedly pervades all superstitious worship. 'They think they shall be heard for their much speaking.'

For almost every occasion or operation of life, there were appropriate formulas to be repeated in order to secure success; and many of these, with that reverence for antiquity and conservative tendency which always characterise superstition, continue to live in popular memory, although often the words are so old as to be unintelligible. The Romans, in the days of Cato, used incantations, for curing dislocations, full of words the meaning of which had been lost. A form of words used to this day in Shetland for healing a sprain can be traced back to the 10th century. In its earliest form, as found in an old German manuscript, it narrates how Woden and Baldur riding out to hunt, Baldur's horse dislocated its foot, and how Woden, using charmed words, set bone to bone, &c., and so healed the foot. The repetition of this rhymed narration acted as a charm to heal other lamed horses. The modern version of this tradition, as current in Norway, makes the accident happen to the horse of *Jesus*, and *Jesus* himself perform the cure. In Shetland, also, it is the Lord, meaning *Jesus*, that is substituted for Woden; and the formula is applied to the healing of persons' limbs as well as those of horses. The operation is thus described in R. Chambers's *Popular Rhymes of Scotland*: 'When a person has received a sprain, it is customary to apply to an individual practised in casting the "wresting-thread." This is a thread spun from black wool, on which are cast nine knots, and tied round a sprained leg or arm. During the time the operator is putting the thread round the affected limb, he says, but in such a tone of voice as not to be heard by the bystanders, nor even by the person operated upon:

Our Lord rade,
His foal's foot slade;
Down he lighted,
His foal's foot righted.
Bone to bone,
Sinew to sinew,
Blood to blood,
Flesh to flesh.

Heal, in name of the Father, Son, and Holy Ghost.'

INCARNATION (Lat. *in*, and *caro*, *carnis*, flesh), a term much used in theology concerning the union of the divine nature of the Son of God with human nature in the person of Christ. We read in John, i. 14, that 'the Word was made flesh;' but this is understood not as signifying a change of nature, but an assumption of human nature into personal union with the divine nature. In accordance with Luke, i. 35, and other texts of Scripture, the formation of the human nature of Christ is ascribed to the Holy Ghost. The reality of the human nature of Christ was much disputed in the

first ages of Christianity, but in our times the chief dispute as to the person of Christ relates to his divine nature. Whilst the doctrine of the incarnation is generally asserted by all who profess Christianity, except Unitarians (q. v.), no explanation of it is attempted or deemed possible. It is regarded, however, as a doctrine fraught with most important consequences, affecting the whole system of Christianity. In the doctrine of the incarnation, it is maintained that in union with the divine nature of the Son of God, there was, and is, in the person of Christ, not only a true human body, but a human 'reasonable' soul.

INCAS. See **PERU**.

INCENDIARY LETTER, a letter threatening to burn the house or premises of a person, generally called a threatening letter. To send such a letter is felony, punishable by three years' penal servitude. The offence is punishable in Scotland according to the discretion of the court.

INCENDIARY SHELLS, another name for Carcasses (q. v.).

INCENSE (Heb. *miktar*, *kitter*, and *kitturoth*), a perfume, the odour of which is evolved by burning, and the use of which, in public worship, prevailed in most of the ancient religions. The incense at present in use consists of some resinous base, such as gum olibanum, mingled with odoriferous gums, balsams, &c. There is no regular formula for it, almost every maker having his own peculiar recipe. The ingredients are usually olibanum, benzoin, styrax, and powdered cascarilla bark. These materials, well mingled, are so placed in the censer or thurible as to be sprinkled by falling on a hot plate, which immediately volatilises them, and diffuses their odour through the edifice.

Among the Jews, the burning of incense was exclusively employed as an act of worship, and, indeed, would appear to have been in itself regarded in the light of a sacred offering. The same would also appear for the religion of Egypt; but the Persian sculptures exhibit the burning of incense as one of the marks of honour offered to royalty.

In the Catholic Church, both of the West and of the East, incense is used in public worship, more particularly in connection with the Eucharistic service, which is regarded as a sacrifice; but writers are not agreed as to the earliest date at which its use can be traced. St Ambrose, in the Western Church, alludes to incense in terms which suppose the practice of burning it to be an established one; and in later writers, it is mentioned familiarly as a part of ordinary public worship. In the Roman Catholic Church, incense is used in the solemn (or high) mass, in the consecration of churches, in solemn consecrations of objects intended for use in public worship, and in the burial of the dead. There are also minor incensations of the celebrating bishop or priest and inferior ministers; of prelates, princes, and other dignitaries officially present at the public service, and a general incensation of the whole congregation.

In the Reformed churches, the use of incense was abandoned at the same time with other practices which have been laid aside by them as without 'warrant of Scripture.'

INCENSED, or **ANIMÉ**, an epithet applied in Heraldry to panthers or other wild beasts borne with flames issuing from their mouths and ears.

INCEST (Lat. *in*, not; *castus*, chaste) is the marrying of a person within the Levitical degrees. In the old ecclesiastical law (now obsolete), and in Scotland, it comprehends cohabitation irrespective of marriage. The law of England enforced these prohibitions by

several statutes in the reign of Henry VIII., which are still in force. Recent cases have determined that a marriage between a widower and his deceased wife's sister comes within these rules, and is void, and it makes no difference that the marriage was celebrated in a foreign country, as, for example, Denmark, where these marriages are legal, provided the parties were domiciled in England, and went there merely to evade the English law. It has also been decided in England, that the same rules which apply between legitimate relations apply between natural relations, though one is illegitimate—as, for example, between a man and the daughter of an illegitimate sister of his deceased wife. Though incestuous marriages are utterly void in England, still it is not a criminal offence to marry incestuously, not even in those cases in which the connection is most abhorrent to the moral sense of mankind, and the remedy in the ecclesiastical courts may be considered obsolete. In Scotland, incest, which is calculated on the same grounds, not only makes a marriage void, but the better opinion is, that to marry incestuously, as well as to commit incest, is a capital offence. See **MARRIAGE**.

INCH, a Gaelic word, corresponding to Irish *innis*, and signifying Island (q. v.); the same root appears in Lat. *ins-ula*. Inch and Innis enter into many compounds, as Inchcolm (q. v.), Inniscattery, an island in the estuary of the Shannon.

INCHCOLM (of old, 'St Colm's Inch,' as in Shakspeare's *Macbeth*, act i. sc. 2; in Lat. *Aemonia*, and *Insula Sancti Columbe*), an islet, beautifully placed in the Firth of Forth, within sight of Edinburgh. It is separated from the north or Fife shore by a channel less than a mile broad, called 'Mortimer's Deep.' The isle is somewhat more than half a mile in length, and less than a third of a mile broad where widest. It had a population in 1861 of 7. It takes its name from St Colm or Columba (q. v.) of Iona, who is said to have dwelt here while labouring for the conversion of the Northern Picts in the 6th century. In the year 1123, King Alexander I. of Scotland, being shipwrecked upon it, found it inhabited by a solitary hermit, who lived on shell-fish and the milk of one cow, and served St Columba in a little chapel or oratory. The king, in gratitude for his escape, founded on the island an abbey of Austin canons regular. Walter Bower, the enlarger and continuator of the *Scotichronicon* of John of Fordun (q. v.), was abbot of the monastery from 1418 till 1449. It was repeatedly sacked by the English during the 14th, 15th, and 16th centuries. The buildings, which have long been in ruins, shew traces of Romanesque work (of about the middle of the 12th c.); but are chiefly First Pointed (of the 13th and 14th centuries). The tower has some resemblance to the tower of Iona. The oldest edifice is a little vaulted oratory (20 feet long by 7 broad), believed to, represent the chapel in which King Alexander found the anchorite serving St Columba in the 12th century. It is of the same type as the Irish oratory of Gallerus. It has been lately restored. The history of I. has been written with great detail by Professor Simpson, in the *Proceedings of the Antiquaries of Scotland*, vol. ii. pp. 489—528. The chartulary of the abbey is about to be printed by the Maitland Club.

INCHKEITH, an island in the Firth of Forth, nearly midway between Leith and Kinghorn. It is a mile in length, and not much more than a third of a mile broad where widest. Its population in 1861 was 12. It is believed to be the site of the town or stronghold of Giudi, described by Bede (who wrote about 731 A.D.) as situated in the middle of the

great arm of the sea which runs into Britain from the east (that is, the Firth of Forth). From the island fortress of Giudi, the inlet in which it stood was of old called 'the sea of Giudin,' and hence also, probably, I. took its name. The island is said to have been the site of a church or monastery, founded between 679 and 704 A.D. by St Adamnan, the biographer of St Columba, and his successor in the abbacy of Iona. I. was seized by the English in 1547, when they built a fort, which, in 1549, was taken by the French auxiliaries of Scotland, who gave the island the name of the 'Isle of Horses.' A light-house was built on the site of the fort in 1804. The island, which belongs to the Duke of Buccleuch, is part of the parish of Kinghorn, in Fife.

INCIDENCE, ANGLE OF. See **CATOPTICS**.

INCIDENT DILIGENCE. In Scotch Law, letters of incident diligence are issued to compel the attendance of witnesses and havers at a trial. In England, a subpoena and a subpoena *duces tecum* are similar writs.

INCLIPITUR, in English Law, the formal commencement of a judgment in a common law court.

INCLINED PLANE, **THE**, is reckoned one of the Mechanical Powers (q. v.), because, by rolling it up a plane, a man may raise a weight which he could not lift. This principle is extensively made use of, chiefly in the raising of weights and in road-making. It is here unnecessary to go into a mathematical investigation of the theory of the inclined plane, as it may be seen in the common books on mechanics, but the result is as follows: The force required to lift a body (viz., its weight) bears to the force required to keep it from rolling down an inclined plane, the same proportion that the length of the inclined plane bears to its height; also the weight of the body bears to the weight which tends to bend or break the inclined plane, the same proportion that the length of the plane bears to its base. Let us

suppose a plane, whose length, AB, is thirteen feet; base, AC, twelve feet; and height, BC, five feet; and let the weight be 780 pounds. Then the force P, which can sustain 780 pounds on the inclined plane, is $\frac{5}{13}$ ths of 780, or 300 pounds (i. e., a force which could just lift 300 pounds); also the force R, which presses perpendicularly on the plane, is $\frac{12}{13}$ ths of 780, or 720 pounds. When the weight has not only to be sustained on the plain but drawn up it, the resistance of Friction (q. v.) has to be added to the power necessary to sustain the weight. In common roads, engineers are agreed that the height of an incline should not exceed $\frac{1}{20}$ th of the length, or, as they phrase it, the *gradient* should not be greater than one in twenty. It may here be mentioned that knives, chisels, axes, wedges and screws, are merely modifications of the inclined plane, but the last two being generally classed as distinct mechanical powers, will be treated each under its own head.

INCOMBUSTIBLE FABRICS have of late years become of great importance, owing to the terrible frequency of death from the ignition of clothing; the search, however, after some means of rendering garments incombustible has continued from a very early period (see Beckmann's *History of Inventions*). After many more or less successful attempts by Gay-Lussac and other chemists, Messrs

Versmann and Oppenheim communicated to the British Association, at Aberdeen in 1859, the results of a series of experiments for rendering linen, calico, muslin, and all other vegetable fibres unflam-
mable.* They found that many salts possessed this power, but at the same time some of these injured the fabric, spoiled the colour, or were so very expensive, as to render their general use impossible. Two, however, viz., tungstate of soda and sulphate of ammonia, produced the best results without injuring the tissue or colour of the fabric. The first of these acts physically by preventing contact with the air, and does not interfere with the processes of ironing and starching; it is therefore preferable for goods requiring washing. The best method of applying it is by mixing in the proportion of 4 ounces of tungstate of soda to 1 drachm of phosphate of soda (to prevent the formation of a partially insoluble bitungstate), and dissolving the whole in an imperial pint of water. For fabrics which are worn without previous washing, sulphate of ammonia is preferable, and a solution containing 7 per cent. of the crystalline salt is a perfect preservative. In printed muslins of a madder purple, however, a slight paleness of colour is produced, but in no other case is the colour affected, nor does it interfere with the ironing process. It is to be hoped that these simple and efficacious preservatives will soon come into general use.—The incombustible fabrics of the ancients were formed of Asbestos (q. v.).

INCOME-TAX, a tax imposed on all persons having incomes above £100, whether from lands or labour. Various acts have passed from time to time to impose this tax—the first introduced by Pitt, and latterly revived in 1842 by Sir Robert Peel, since which date it has been continued—the fairness and public policy of which have given rise to long and endless controversy. See **TAXATION**.

INCOMMENSURABLE MAGNITUDES, or **INCOMMENSURABLE QUANTITIES**, are those which have no common measure, i. e., are not, both of them, multiples of the same unit, however small that unit be taken. Examples of incommensurable magnitudes are abundant in mathematical science. Thus, the side and diagonal of a square; the diameter and circumference, or diameter and area of a circle, &c.; 2 and $\sqrt{3}$; $\sqrt{5}$ and $\sqrt{7}$, &c. The term incommensurable magnitudes is used in arithmetic to denote two numbers which have no common measure greater than unity.

INCORPORATIONS. See **CORPORATIONS**.

INCORPOREAL HEREDITAMENT. See **HEREDITAMENT**.

INCUBATION, THE PERIOD OF, or the duration of the time in which birds sit on their eggs before the young are hatched, varies in different species, but is nearly constant in each. In the humming-birds, the smallest animals of this class, it is only 12 days; in canaries, it is from 15 to 18 days; in the common fowl, it is 21 days; in the duck, it is from 28 to 30 days; in the guinea-fowl, it is 28 or 29 days; in the turkey, 30 days; and in the swan, from 40 to 45 days. A certain degree of heat (about 104°) is necessary for the development of the young bird; that of the sun is sufficient, during the day, to hatch the eggs of some birds (for example, the ostrich) inhabiting tropical countries, but in general the mother keeps up a suitable temperature by placing the eggs in a warm and carefully constructed Nest (q. v.), and by covering them with

her own body. In some cases, the male bird takes part in this duty; usually, however, his services are restricted to providing his mate with food.

Eggs may, however, be hatched without the aid of the parent bird. From time immemorial, the Egyptians have hatched eggs by artificial warmth in peculiar stoves called *Mammals*. In 1777, Mr Bonnemain devised an apparatus by which, for several years before the French Revolution, he supplied the Parisian markets with excellent poultry, at a period of the year when the farmers had ceased to supply it. A description of this apparatus is given in *Ure's Dictionary of Arts, &c.*, 5th ed. 1860, vol. ii. p. 496.

The process of artificial incubation was publicly exhibited some years ago in London, by means of the *Eccaleobion machine* (derived from *ekaleo*, I call forth, and *bion*, life), which was invented by Mr Bucknell, and is described in his *Treatise on Artificial Incubation*. This machine possessed a perfect control over temperature from 300° Fahrenheit to that of cold water for any length of time, and 'by means of this absolute and complete command over the temperature, the impregnated egg of any bird, not stale, placed within its influence at the proper degree of warmth, is, at the expiration of its natural time, elicited into life, without the possibility of failure.' That chickens were hatched in large numbers by this machine is undoubted, but for some reason—probably from the process not proving sufficiently economical for commercial purposes—the *Eccaleobion* has not been lately heard of.

In 1825, M. D'Arcet obtained chickens and pigeons at Vichy by artificial incubation effected by the thermal waters of that place.

INCUMBENT, the rector, parson, or vicar holding an ecclesiastical benefice in England or Ireland. It is seldom used in Scotland except popularly in a similar sense.

INCUMBRANCES, a general term for burdens or charges on land. See **HERITABLE SECURITIES**, **MORTGAGES**, **LIENS**.

INCUNABULA, a Latin word signifying cradle, is employed by bibliographers to designate the first fruits of the art of printing; the books which, as Peignot has it, *touchent au berceau de l'imprimerie*. The term is usually restricted to those which appeared before the year 1500, by which time the art was completely formed in all its principal departments. The number of these works is probably not far short of 20,000. Hain, it is true, in his *Repertorium Bibliographicum*, enumerates only 16,299; but as he unfortunately died before his work was completed, it is confessedly imperfect, especially in the last volume.

Incunabula, with hardly any exceptions, belong to the category of rare books, and are therefore much sought for by collectors; but besides the interest attaching to them as literary curiosities, many of them, such as the first editions (*éditiones principes*) of the Greek and Roman classics, are intrinsically valuable in a critical point of view; whilst others are important, as marking the successive steps by which the art of printing advanced towards perfection. Information as to these particulars will be found in the article **PRINTING**.

The principal works treating specially of incunabula are—Panzer, *Annales Typographici, ab Artis Invente Origine ad Annum M.D.* (continued, however, to 1536), 11 vols. 4to, Norimbergæ, 1793—1803; Maittaire, *Annales Typographici, ab Artis Invente Origine ad Annum 1557 (cum Appendice ad Ann. 1664)*, 3 tom. in 5 vols. 4to, Haga-Comit. 1719—1725; Serna Santander, *Dictionnaire Bibliographique Choisi du XV^e Siècle*, 3 tom. Svo,

* Silks, worsteds, and animal fibres may be ignited and charred, but they do not burst into flame, because the gases they yield are not inflammable; vegetable fibres, on the other hand, largely evolve carburetted hydrogen.

Bruxelles, 1805—1807; and Hain, *Repertorium Bibliographicum, quo Libri omnes ab Arte Inventa usque ad M.D. Typis Expressi recensentur*, 4 tom. 8vo, Stuttgartiae, 1828—1838. With all its imperfections, the last is the best work we have on the subject. Much valuable information, conveyed in a pleasing and attractive style, will also be found in Bernard, *De l'Origine et des Débuts de l'Imprimerie en Europe*, 2 tom. 8vo, Paris, 1853.

INDEBITATUS ASSUMPSIT, the name often given to an action for debt in England.

INDECENT EXPOSURE is a criminal offence both at common law and in England and Ireland also by statute. It is not clearly settled whether more than one person must have witnessed the indecency, in order to make it an offence. The exposure must be in some public place. By the statute 5 Geo. IV. c. 83, s. 4, the offence is punishable summarily by three months' imprisonment. To sell or expose an obscene book, print, or picture, is also punishable by fine and imprisonment and hard labour; and a warrant can be obtained under 20 and 21 Vict. c. 83, to search premises, and seize and destroy such books, &c. In Scotland, indecent practices are also indictable offences, but the law is somewhat vague, and the punishment left to the discretion of the court.

INDEMNITY DEED, in English Law, is a deed given by way of security. The usual form of indemnifying a person is by giving a bond of indemnity, which operates if the engagement is not fulfilled, but otherwise becomes void. A similar bond is called generally a bond of relief in Scotland.

INDENTED, in Heraldry, one of the partition lines of the shield, similarly notched to Dancetté (q. v.), but with the notches much smaller, and not limited in number.

INDENTED HEAD, a peninsula in the colony of Victoria, bounds the entrance to Port Phillip on the west.

INDENTURE, the technical name given in England to a deed under seal, entered into between two or more parties with mutual covenants. Formerly, it required to be actually indented—i. e., notched or toothed (Lat. *dent*, tooth), or cut in a waving line, so as to correspond with the other copy of the deed—but this is no longer necessary. The name is not used in a general sense in Scotland, except in the case of indentures of apprenticeship (q. v.), though in England it is a synonym for the kind of deeds mentioned.

INDEPENDENTS, or CONGREGATIONALISTS, are a sect of professing Christians, supposed to have originated in England about the year 1583. A tract embodying their views was published at that time by Robert Brown, who is to be regarded as their founder. The Independents are opposed both to the Presbyterian and Episcopalian form of church government. The essential element of their doctrine is, that any community of Christians has a right to the regulation of its own ecclesiastical discipline and form of worship, independent of any other community; each congregation forming in itself 'a church.' It is on their interpretation of this word 'church' (Gr. *ekklesia*), as used in Scripture, that they rest this doctrine, which they hold in common with the Baptists. They hold that wherever the word occurs in the Bible, it is used to denote either a single congregation, or the place where the congregation has met. It is never used, they hold, to denote the aggregate of Christian communities, the plural 'churches' being employed for this purpose; as, 'Let your women keep silence in the churches' (1 Cor. xiv. 34). Before admission to

a congregation, they hold that there must not only be an intellectual assent to the historical narrative of Christianity, but that there must be satisfactory signs of the presence of its spiritual essence in the heart. Any man whom a congregation may think qualified to edify them, is eligible for the ministry. Ordination is performed by the ministers of neighbouring churches. It is considered merely an affair of order, and it is not held that office is thereby conferred, gifts bestowed, or authority conveyed. The power of churches they hold to be purely spiritual, and acknowledge no head but Christ. It might at first sight appear likely that this perfect independence of each congregation would render their working harmoniously together a matter of great difficulty; but experience has shewn the contrary. By leaving each congregation to act independently in its church discipline, many disputes which might have spread widely have ended where they began. They are satisfied to agree about the essentials of religion, to sink minor differences which the fallibility of human judgment renders inevitable, to leave the determination of the accessories of its worship to the taste and feeling of each congregation, and to act in unison for the furtherance of the great truths of Christianity. At the Westminster Assembly, called together by the authority of the parliament on 1st January 1643, to determine the worship and discipline of the national church, it was found that of the 70 or 80 members who composed it, only five were Independents. Presbyterianism was carried by a great majority. Through the influence of Cromwell, however, it never became really established; and in 1658, a great meeting was held, at which a declaration was drawn up, precisely the same as that of the Westminster Assembly, except that the chapter in favour of the Presbyterian form of church government was omitted, and another in favour of the Independent doctrine put in its place. It is difficult to say what might have been the result of this struggle between the Presbyterian and the Independent parties, had it not been put an end to by the restoration of Charles II. in 1660, and the re-establishment of Episcopacy.

By the passing of the act of Uniformity in 1662, the Independents, along with other Nonconformists, were subjected to much suffering. The act required an express acknowledgment of the principles of Episcopacy. Its effect was to cause 1900 or 2000 of the clergy to leave the church. These are 'the illustrious two thousand' of whom Nonconformists speak. Still, the Independents increased; and the Revolution of 1688, and passing of the Toleration Act in 1689, at length brought them relief. Efforts were made about this time to bring about an accommodation between them and the Presbyterians, and in 1691, heads of agreement were drawn up. Finally, in 1730, Presbyterians, Baptists, and Independents formed themselves into a united body under the name of the Three Denominations. They were for long in the habit of consulting together for the general welfare; but this union has of late been disturbed by the withdrawal of the Presbyterians. An extraordinary manifestation of religious zeal, following what has been called the period of religious indifference, took place about the middle of last century. This was mainly owing to the influence of the Wesleys and Whitefield. Many of the enthusiasts joined the old Independents. By this accession, the Independents came to form the largest dissenting body in England except the Wesleyan Methodists; and this they still continue to be. By the census of 1851, the number of their churches in England and Wales is given at 3244, with accommodation for 1,067,760 persons, and an estimated attendance of 793,142 (see art. GREAT BRITAIN).

Independency has unquestionably prospered in England. Owen, Howe, Baxter, Calamy, Watts, Henry, Doddridge, Pye Smith, and many other illustrious names adorn its history.

There are ten training colleges for students in connection with the Independent body in England. These are :

	Date of Formation.	No. of Students.
Western College, Plymouth,	1752	16
Rotherham College,	1756	19
Brecon College,	1760	34
Cheshunt College,	1768	27
Airedale College, Bradford,	1784	20
Hackney College,	1796	20
Lancashire College,	1806	38
Spring Hill, Birmingham,	1838	21
New College, London,	1850	40
Cavendish Theological College, Manchester,	1860	22

In Scotland, Independency may be traced back to the days of the Commonwealth, during which it was imported by the soldiers of Cromwell. It was not, however, until 1729 that it made much progress in Scotland. In that year, Robert Glass published a work avowing his conformity with the views of the English Independents, more particularly as these were developed in the writings of Dr Owen. —Various sects arose about the same time, professing the leading doctrines of the Independents. Sandeman founded the Sandemanians; Dale, the old Scots Independents. It is not, however, till the close of last century that Independency can fairly be said to have established itself in Scotland. At this time, religious revivals took place under the agencies of James Haldane and John Aikman. The result was a great accession of strength to the Independent body. In 1797, Haldane and Aikman made a tour as far north as the Orkney Islands, for the purpose of preaching. Others soon followed this example, so that itinerant preachers were at this time to be met with all over the country. But their zeal provoked the enmity of some of the other sects. The Relief Synod passed a resolution forbidding their clergy to allow any men to preach in their pulpits who were not regularly bred to the ministry. Notwithstanding this opposition, the itinerant preachers, animated by zeal for the great cause in which they were engaged, were so successful, that between 1798 and 1807, no fewer than 85 churches were founded, and pastors ordained. In 1807, the publication of Ballantyne's *Treatise on the Elder's Office*, was the cause of a good deal of unfortunate discussion among the Independents. 'Bitter contentions,' says Kinniburgh (*Historical Survey of Congregationalism in Scotland*), 'strife of words, jealousies, and divisions followed, of which none but such as passed through the painful scenes of those days can have an adequate idea.' The formation, in 1811, of the Glasgow Theological Academy (now removed to Edinburgh), has done much to restore to the Independent body the vigour which it had lost during this unfortunate controversy. The Congregational Union, to assist churches in supporting pastors, has also been of great benefit. The number of churches in Scotland, per census of 1851, is 192, with accommodation for 76,342 persons. The Morisian doctrines (see MORISIANS) have been openly professed by several of the Independent clergy in Scotland. Baptists hold views similar to the Independents as to the Scripture meaning of the word 'church.'

In America, the first Independent church was founded by John Robinson at Plymouth, New England, in 1620. In 1637, the spread of Antinomian doctrine caused much discussion in the church. By a synod convened in New England, Antinomianism was unanimously condemned. In 1638, Harvard College was founded. In 1658, the Savoy

Confession was adopted. It still remains in force. About 1750, Unitarian principles spread widely in the congregational churches of America. In 1785, a separation took place between the Unitarians and the Trinitarians, but both still retain the congregational form of church government. Harvard College is Unitarian. 'Congregationalism,' according to Dr Schaff, 'is the ruling sect of the six north-eastern states, and has exerted, and still exerts, a beneficial influence upon the religious, social, and political life of the whole nation.' According to the Year-Book (1859) of the American Congregational Union, the number of Independent churches in the United States is nearly 2700, and the number of members about 250,000. Exclusive of Harvard and other colleges, in the administration of which they have a share, the American Independents possess theological seminaries at Andover, Bangor, New Haven, East Windsor, Oberlin, and Chicago. The following are good works to consult: Dr Vaughan's *History of English Nonconformity* (London, 1862); J. Fletcher's *History of Independency* (London, 1862); Waddington's *Early History*; and Mosheim's *General Church History*.

INDETERMINATE PROBLEMS. It was shewn in the article EQUATIONS that the values of the unknown quantities could only be determined when the number of equations was equal to the number of unknown quantities, but that, if the latter exceeded the former, several values might be found for each unknown, in which case the problems which give rise to the equations are called *indeterminate problems*. For example, 'To find the number which, when divided by 2 and 3, leaves remainders 1 and 2,' is an indeterminate problem, admitting of an infinite number of solutions; for though only one unknown quantity appears in the question, yet, in order to form an equation, we are obliged to proceed in the following manner: as x is divisible by 2, with a remainder 1, $x = 2p + 1$; again, as x is divisible by 3, with a remainder 2, $x = 3q + 2$; hence we have the equation $2p + 1 = 3q + 2$ (one equation to find two unknown quantities), from which, by a process which is explained in the ordinary books on algebra, we find $x = 6r - 1$, where r is any positive number whatever. The values of x are, therefore, 5, 11, 17, 23, &c. In general, if the equation is of the form $ax + by = c$, the number of pairs of values (of x and y) is finite; but if of the form $ax - by = c$, the number is infinite. The Diophantine (q. v.) analysis exhibits a very interesting class of indeterminate problems of the second degree.

INDEX (more fully INDEX LIBRORUM PROHIBITORUM), a catalogue published by Papal authority in the Roman Catholic Church of books the reading of which is prohibited to members of that church, whether on doctrinal, moral, or religious grounds. As a natural consequence of the claim of the Catholic Church to authority in matters of religion, and to infallibility, that church also claims the right or the duty of watching over the faith of its members, and of guarding it against every danger of corruption, the chief among which is held to be the circulation of books believed to be injurious to faith or to morality. The earliest recorded exercise of this restrictive authority is the prohibition of the writings of Arius; and a council of Carthage, in the year 393, issued, even for bishops, a similar prohibition of Gentile books, although it permitted to them the reading of the works of heretics. The earliest example of a prohibitory catalogue is found in the decree of a council held at Rome (494) under Pope Gelatius (*Labbe Conc.*, ii. col. 938—941), which, having

enumerated the canonical books of Scripture and other approved works, recites also the apocryphal books, together with a long list of heretical authors, whose writings it prohibits, and orders to be eliminated from the churches. The medieval popes and councils pursued the same course as to the heterodox or dangerous writings of their respective periods, and the multiplication of such books after the invention of printing led to a more stringent as well as more systematic procedure. The university press of Louvain issued in 1546, and again in 1550, a catalogue of prohibited books. Similar lists appeared by authority at Venice, Paris, and Cologne; and Pius IV. issued in 1557 and 1559 what may be regarded as properly the first Roman Index. One of the gravest undertakings of the council of Trent was a more complete and authoritative enumeration of all those books the use of which it was expedient to prohibit to the faithful. A committee was appointed for the purpose, and had made great progress in the work; but it was found impossible to bring the examination of the books to an end before the close of the council; and the entire of the papers of the committee were handed over by the council to the pope, with instructions that the work should be completed, and the result published by his own authority, which was accordingly done by Pius IV. in 1564. Further additions and certain modifications of its rules were made by Sixtus V. and Clement VII. It was republished in 1595, and with the addition of such books as from time to time it was deemed expedient to prohibit, in several subsequent editions, the most remarkable of which are those of Brasichelli (Rome, 1607); Quiroga, *Index Librorum Expurgandorum* (Salamanca, 1601); and Sotomayor, *Novissimus Index* (Madrid, 1648). The edition best known to modern theological readers is that of Rome, 1819. In the intervals between the editions, the decrees by which further additions to the Index are made, are made public at Rome, and circulated in the various countries.

The prohibitions of the Roman Index are of two classes, either absolute and total, or partial and provisional, 'until the book shall have been corrected.' The edition of Quiroga, mentioned above, regards the latter. The ground of the prohibition may be either the authorship of the work, or its subject, or both together. Under the first head are prohibited all the writings of *heresiarchs*—i. e., the first founders of heresies—no matter what may be the subject. Under the second head are prohibited all books confessedly immoral, and all books on magic, necromancy, &c. Under the third are prohibited all books of heretical authorship treating on doctrinal subjects; all versions of the Bible by heretical authors; and all books, no matter by whom written, which contain statements, doctrines, or insinuations prejudicial to the Catholic religion. The preparation of the Index, in the first instance, was committed to the care of the Congregation of the Inquisition in Rome; but a special Congregation of the Index was established by Pius V., and more fully organised by Sixtus V. This congregation consists of a prefect (who is always a cardinal), of cardinals, of consulters, and of examiners of books (*qualificatores*). Its proceedings are governed by rules which have been authoritatively laid down by several popes, especially by Benedict XIV., in a constitution issued July 10, 1753, to which the reader is referred for the best and most authentic exposition of a subject on which much misconception exists on the part of Catholics as well as of Protestants.

The growth of modern literature has, of course, entirely outstripped the limited and tardy machinery

of this tribunal. A very small proportion even of the most anti-Catholic publications outside of Italy find their way by name to the Roman Index; but besides the positive prohibitions of the Index itself, there are certain general rules regarding the use of books by which the freedom of what is considered perilous or pernicious reading is much limited among members of the Roman Catholic Church. These, however, would be entirely beyond the scope of our publication; nor could the rules of the Index even be practically brought into operation in those countries where the Catholic and Protestant literatures are so interwoven, that it is impossible to separate them even in the ordinary intercourse of life. See Wetzser's *Kirchen-Lexicon*, art. 'Index.'

Few parts of the Roman Catholic system are more repugnant to intelligent Protestants than the institution of the 'Index,' as it strikes at the root of the fundamental principle of Protestantism itself—namely, that of private judgment. And this theoretical repugnance is increased by seeing that, in its practical working, such names as Gibbon, Robertson, Guicciardini, Sismondi, Hallam, Goldsmith (*History of England*), Descartes, Locke, Kant (*Essay on Pure Reason*), J. S. Mill (*Political Economy*), Whately (*Logic*), Bacon, Milton, Addison, Dante (*De Monarchia*), &c., are put under the ban.

INDIA,* an extensive region of Southern Asia, celebrated during many ages for its riches and valuable natural productions, its beautiful manufactures and costly merchandise, the magnificence of its sovereigns, and the early civilisation of its people. It possesses especial interest to the Englishman, from the intimate connection of its history with that of his own country, as a land where a company of British traders succeeded to the proud inheritance of the House of Timur, and a few forts and factories laid the foundation of an empire vaster than that of Aurungzebe—the most splendid appendage to the British crown.

Hither I. is the central peninsula of Southern Asia, and lies in 8° 4'—35° N. lat., and 67°—92° E. long. According to these limits, its length may be stated approximately at 1900 miles, and its breadth, reckoned along the parallel of 25° N. lat., at 1600 miles, with an area of about 1,300,000 square miles. The natural boundaries of this vast region are, on the N., the range of the Himalaya Mountains, which separates it from Tartary, China, and Tibet; on the W., the Suliman Mountains divide it from Afghanistan and Beloochistan; from the mouth of the Indus to Cape Comorin, it is washed by the Arabian Sea, and thence to the mouths of the Ganges, by the waters of the Bay of Bengal; from this point, the Brahmaputra forms its eastern boundary. From the mouths of the Brahmaputra and the Indus, the east and west coasts, inclining towards the same point, meet at Cape Comorin, and thus give to Southern I. the form of an irregular triangle. The two sides of the triangle have each a coast-line of about 2000 miles. I. is, in fact, from its great extent of seaboard, essentially a maritime country.

Physical Features.—I., thus enclosed, presents a most diversified surface and varied scenery; it has

* The name is borrowed by the Greeks from the Persians, who, however, applied the name of *Hindus* at first only to the dwellers on the banks of the river *Sindhu* (Sans. for Indus). From this, by the regular change of *s* into *h*, the Persian *Hind* is derived. Hindustan (the country of the *Hindus*) is a modern word applied by the Persians to the whole of India; but Europeans understand it as applying properly to that portion of it which lies north of the Vindhya Mountains.

indeed been called 'an epitome of the whole earth.' Within its limits are to be found lofty mountain-ranges, towering far above the line of perpetual snow; broad and fertile plains, bathed in intensest sunshine; arid wastes, impenetrable forests, undulating hilly countries, and elevated plateaux. The surface is occupied chiefly by two great river-basins, those of the Ganges and the Indus, and a central table-land. To describe it more particularly, it may be noticed under its natural divisions—of the plain of the Ganges, the plain of the Indus, the mountainous region of Hindustan Proper, and the peninsular portion of the country to the south of the Vindhya Mountains.

The Plain of the Ganges, which includes Bengal, Bahar, the Doab, Oude, and Rohilcund, is a vast alluvial flat, extending from the Bay of Bengal to the Punjab. Throughout its entire length, the Ganges and its numerous tributaries spread out like the veins of a leaf, carrying everywhere their fertilising influence. The population of these fertile and well-cultivated plains is very dense. Scattered over the agricultural districts, and massed in the great cities and towns, there are not less than 80,000,000 people.

The Plains of the Indus, in the north-west, are less extensive than those of the Ganges, and are separated from the latter by the Aravulli Hills. The Punjab occupies the northern portion. South of the Punjab, and parallel with the river, the great sandy desert of the Indus extends for nearly 500 miles. The valley of the Indus is continued through the province of Sind to the ocean.—It has been estimated that the alluvial soils of I. occupy a third of its entire surface. They are of inexhaustible fertility, and rich in vegetable matter.

The Highland Region of Northern Hindustan—the Central I. of some geographers—extends from the Vindhya Mountains as a base, to Rewarri on the Jumna. It includes the table-lands of Malwa and Rajasthan, and forms a vast plateau 700 miles long, by 100 to 250 miles broad, with an elevation of about 2000 feet above the level of the sea.

The Peninsular Portion of India, south of the Vindhya Mountains, which remains to be considered, is called by the natives the Deccan (q. v.). The most remarkable geographical feature of Southern I. is a central table-land—a vast plateau—extending from 12° to 21° N. lat., rising from 2000 to 3000 feet above the sea, and enclosed on all sides by lofty mountains, between which and the sea, on the east and west, are narrow strips of low flat country, divided into several districts. From the low country on the coast to the central table-land, the mountains rise abruptly, in a succession of gigantic terraces or steps, and hence the name of 'Ghauts' (q. v.). The rivers of the Deccan rise in the Western Ghauts, and after traversing the table-land, descend to the sea over the Eastern Ghauts. The slope of the country corresponds with the course of the rivers; it has a gradual inclination towards the east.

Of all the mountains of India, the *Himalaya* (q. v.) are the most famous. The *Suliman* Mountains, which form the western boundary of the trans-Indus provinces, extend from about 34° N. lat. 350 miles due south, and culminate in the lofty summit of Takht-i-Sulaiman, or Solomon's Throne, 11,000 feet above the level of the sea, in 31° 35' N. lat. In breadth, this range varies from 8 to 14 miles in the highest portion. The *Vindhya* range is the next important natural boundary, crossing India between the 22° and 25° of N. lat., thus separating Hindustan Proper from the southern or peninsula portion of the country, and forming the northern boundary of the valley of the Nerbudda. These mountains, which nowhere

exceed 6000 feet in height, connect the northern extremities of the Western and Eastern Ghauts. The Sautpura range, between the Nerbudda and Taptee valleys, is a spur of the Vindhya. The *Western Ghauts* run parallel with the Indian Ocean at a distance of 20 to 40 miles. On the opposite coast, forming the south-eastern buttress of the table-land of the Deccan, are the *Eastern Ghauts* (see GHAUTS). The physical geography of Southern India presents the singular phenomenon of isolated masses upheaved amidst the vast plains that occupy the greater portion of the peninsula. Of these, the most remarkable are the Neilgherries (q. v.) or Blue Mountains. Of the minor mountain-ranges of I., the principal are the Nepal plateau, rising to an altitude of from 3000 to 6000 feet; the Sewalik range, near Hurdwar, rising 3000 feet; the Kala or Salt range, adjacent to the Suliman range, rising 2500 feet; the Aravulli, between the basins of the Ganges and the Indus, culminating in Mount Abu at an altitude of 5000 feet; the Kattywar Hills, rising from 1000 to 3000 feet in the centre of the Kattywar peninsula; the hills of Bundelcund, 2000 feet; and the Rajmahal hills, rising from 5000 to 7000 feet.

The *river system* of I. is on a grand scale. The Indus (q. v.) traverses the north-west, and drains about 400,000 square miles of country. The Ganges (q. v.), on the north-east, together with its tributaries, drains an area of about 500,000 square miles. The eastern side of I.—the region southward of the Nerbudda, and eastward of the Malabar Ghauts—is watered by eighteen rivers, the principal being the Godavari, 830 miles long; Kistna, 800; Cauvery (Kaveri), 470; Mahanadi, 520; Brahmini, 400; North Pennar, 350; and the South Pennar, 240. About twenty rivers water the western side of India. The most noteworthy are the Nerbudda, 800 miles long; the Tapti, 400—both of which flow into the Gulf of Cambay; the Myhi, 350; Luni, 320; Bunnas, 180; and the Bhadro, 130. The total number of rivers in I. that discharge themselves into the ocean is about fifty.

Geology.—From observations that have been made at different points in I., the general features of its geological structure are to some extent known, but the details, and the true affinities of the Indian strata with the known European series, have yet to be wrought out. Six years ago, a staff of geological surveyors were appointed, under the directorship of Professor Oldham, and important results have already flowed from their few years' labours. Several tracts of country have been surveyed and mapped, and the results have been published in three volumes of illustrative memoirs and maps.

I. is bounded on the north-east by the range of the Himalaya, the great water-shed of Central Asia. These mountains consist of granitic rocks which have penetrated the stratified rocks, thrown them up in endless confusion, and metamorphosed them in many places into gneiss, mica-schist, clay-slate, or crystalline limestone. The nummulitic limestone of Middle Eocene age—a limestone crowded with nummulites, and often almost made up of them—occurs in several localities in the Himalaya, just as we find it in the Alps; and indeed it may be found at intervals throughout the countries which intervene between these two chains of mountains, often presenting itself in masses that are thousands of feet in thickness. The strike throughout the Himalaya is generally north-west, and the dip north-east, with many local variations. Layers of sandstone and conglomerate extend along the base of the mountains. They are of Miocene age, containing the remains of species of camel, giraffe, hippopotamus, sivatherium, elephant, crocodile, and tortoise.

These are extensively developed in the Sewalik Hills, the fossils of which have been elaborately described by Falconer.

An immense tract of Post-tertiary alluvial deposits cover the whole of the river-basins of the Ganges and Indus, stretching across the north of I. from sea to sea.

The Eastern and Western Ghauts consist of metamorphic rocks, which are continued across the country to the north of the Godavery. Between this transverse band of altered strata and the diluvial deposits of the north, a large tract of country is occupied with Palæozoic rocks, frequently broken through and covered with different kinds of trap, and in some places overlaid with Secondary and fresh-water Tertiary strata. Several important memoirs on the structure of the district around Nagpur have been published by the Rev. Messrs Hislop and Hunter. The principal coal-fields of I. occur in this Palæozoic district. It is doubtful whether the coal-bearing strata belong to the Carboniferous period or not. The most important Indian coal-field is the Ranigunj or Burdwan, on the river Damuda, which flows into the Hooghly 50 miles north of Calcutta. It is a belt of coal-bearing strata, consisting of coal and iron beds, as well as limestone suitable for flux, and hard sandstone fitted for building purposes. The strata lie in a basin of metamorphic rocks, and cover an area of 500 square miles, at a distance of from 120 to 160 miles north-west of Calcutta. The iron ores consist of a black band, yielding 39 per cent. of metal; and magnetic ironstone, yielding from 60 to 70 per cent. From this field 365,000 tons of coal were raised in 1861. In the other coal-fields, occurring in seven different localities, only 66,112 tons of all kinds were raised in the same year. The Nerbudda district, previous to 1861, had sent no coal to the market, but in that year, operations were begun in the coal-fields there with good prospects of success. The Punjab has hitherto supplied only a few tons of lignite yearly from the salt range, but no true coal; nor has any been raised in Oude, Madras, or Bombay. Much may be expected from the geological survey in developing the hidden treasures of the country.

The triangular region enclosed by the Eastern and Western Ghauts and the Godavery river is covered chiefly with Trappean rocks, with, however, scattered portions of Secondary and Tertiary strata. At Pondicherry, they are Lower Cretaceous; and at Trichinopoly and Verdachellum, they belong to the Gault and Upper Greensand series.

The minerals of I. are very rich and varied: amongst them are included—besides coal, already mentioned—gold, silver, tin, copper, iron, plumbago, lead; and precious stones—diamonds, rubies, the beryl, topaz, and many others. Gold has been found in I. from time immemorial. The Deccan and the Malabar coast are believed to be gold-bearing districts, and at Dharwar, quartz reefs have been found of the richest description. Copper ore is abundant in Kumaon. The iron region extends for many miles along the base of the Himalaya. The soil of I. is rich in nitre or Saltpetre (q. v.); sulphur has also been obtained.

Vegetable Productions.—The vegetation of I. is as varied as its soil and climate, and passes from the flora of a tropical to that of an alpine region. The groves of palm that border the coast, and, in the interior, the umbrageous mango topes, are striking features of Indian scenery. The Cocoa-nut Palm (*Cocos nucifera*), the Palmyra Palm (*Borassus flabelliformis*), and the Betel Palm (*Areca catechu*), are amongst the most important of the palm tribe. Of the fig tribe, the most remarkable is the Banyan

(*Ficus Indica*). The Bread-fruit Tree (*Artocarpus incisa*) grows on the Malabar coast. The *Poinciana regia*, the *Acacia Arabica*, and the *Acacia catechu* are handsome trees. Of timber trees, the most important is the Teak (*Tectona grandis*), which grows in the mountainous parts of Malabar, and the country bordering the Godavery. The Sandal-wood (*Santalum album*), the Satin-wood (*Chlorokylon swietenia*), the Sappan Tree (*Cæsalpinia sappan*)—are also highly prized. The Sâl Tree grows along the Terai in a belt of forest from the Ganges at Hurdwar to the Brahmaputra. Inexhaustible forests of the finest timber trees grow on the northern slopes of the Himalaya, including the *Deodar*, *Gerrardiana*, *Neoz* (edible pine), several oaks, walnut, maple, hazel, horse-chesnut, and many others.

Of the fruits of India, the pine-apple, custard-apple, mango, pomegranate, melon, plantain, guava, pummelo, loquat, jack, lime, are the most common.

Animals.—The domesticated animals are horses, asses, mules, oxen, buffaloes, sheep, and elephants. Of wild beasts, the most formidable is the Bengal tiger. The other beasts of prey are leopards, wolves, jackals, panthers, bears, hyænas, lynxes, and foxes. The rhinoceros infests Northern Hindustan. Several kinds of deer and antelopes are common, as well as the bison and the neilgye. Monkeys abound in the forests, and the orang-outang is found on the Coromandel coast. Serpents are very numerous. Of poisonous snakes, the cobra da capello, or black-hooded snake, the cobra manilla, and sand-snake are the most common. The great Indian tortoise (*Testudo Indica*) has been known to measure 4½ feet. The Gangetic crocodile is the most noted of the saurians of Hindustan. Myriads of mosquitoes, butterflies, locusts, beetles, spiders, flying-bugs, tarantulas, centipedes, the common fly and the firefly, wasps, bees, and ants of many kinds, are amongst the swarming insects of India. Fish abound in the rivers and seas: the most delicate is the mango-fish. A few of the most characteristic birds of I. are peacocks, pheasants, jungle-fowl, pigeons, parrots, the ibis, the pagoda thrush, bulbul, tailor-bird, the flamingo, pelican, adjutant; and in the northern provinces, eagles, vultures, kites, falcons, rooks, ravens.

Climate.—In a country extending over 26° of latitude—one extremity of which runs far into the torrid zone, and the other terminates in a range of lofty mountains rising far above the line of perpetual snow—a country embracing within its ample circumference lowland plains, elevated plateaux, and alpine regions, the climate must differ greatly. Hindustan Proper may be said to have three well-marked seasons—the cool, the hot, and the rainy. The cool months are November, December, January, and a part of February; the dry hot weather precedes, and the moist hot weather follows the periodical rains. The climate of Southern I. is greatly regulated by the Monsoons (q. v.). The central table-land is cool, dry, and healthy. At Utacamand, on the Neilgherries, 7300 feet above the level of the sea, the mean annual temperature is 57° F.; at Madras, 83°; Bombay, 84°; Calcutta, 79°; Bangalore, 74°; and at Delhi, 72°. The fall of rain varies greatly in different parts of I.: at Calcutta, it measures annually from 50 to 80 inches; at Bombay, it averages 76; Madras, 66; Utacamand, 60; Nagpur, 53; Mahabaleshwar, 4500 feet above the sea, 250; Kotagiri, 80; Darjiling, with 7000 feet of elevation, 122; in the Tenasserim provinces, 200 inches; while in North Assam, on the Cossya Hills, the fall is from 500 to 600 inches, or 50 feet.

Inhabitants.—The prevalent theory as to the ethnology of India is that, in very early times, it was inhabited by tribes or nations belonging to the same stock as the present inhabitants of Central Asia (the Mongolids of Latham); that at an epoch not yet determined, a branch of the Aryan race (q. v.) entered the peninsula from the north-west, established themselves first in the Punjab, and thence gradually diffused themselves as a dominant race over the whole of Northern and Central India, imbuing the subject population more or less completely with their religious system and their language, and thus forming the Hindus. The tribes known as Bheels, Gonds, &c., still inhabiting the mountainous districts and jungles, are supposed to be outstanding islands of the aboriginal population that resisted the tide of Hindu conquest and civilisation. The Hinduising influence extended feebly, if at all, into the Deccan, the great majority of whose inhabitants, therefore, are supposed not to belong ethnologically to the Aryan race. However this may be, it is a fact that the inhabitants of I., unlike those of China Proper, cannot now be considered a homogeneous people, since, through the modifying influence of climate and other causes, they differ as much amongst themselves as do the various nations of Europe.

In physiognomy and cranial development, the Hindus are totally unlike the natives of the Indo-Chinese peninsula. Two ethnological influences, referable to two distinct types, have left their impress upon the people. In the higher castes, the features are regular, the head long, the skin brunette rather than black, and the body admirably proportioned; the face is oval, and the eyes and hair black. In the northern provinces and more elevated parts, the men are strong and muscular. Women of the higher castes are often very beautiful, with dark gazelle-like eyes, delicately formed limbs, feet and hands of exquisite mould, and a soft and polished skin.

To attain to anything like a fair estimate of Hindu character, it would be necessary to refer to the statements of many writers both ancient and modern. The mental condition and peculiarities of the ancient Hindu of the time of Alexander's invasion and the Greek empire in I., have been delineated by several Greek writers. In the songs of the Rig-veda, an active life is portrayed, and we read of wars, triumphs, and defeats; but when the Aryan tribes had become settled on the rich plains of I., they appear to have concentrated their thoughts on the world within. They became passive, meditative, quiet, and full of faith; they devoted themselves to religion and philosophy. This is as true of the Hindu of to-day as it was 2000 years ago; but it is not so easy to arrive at a just estimate of his moral character. Ages of despotism, and a corrupt religion, have had a debasing effect on the Hindu mind; but whatever doubt there may be about the moral character of the Hindu, it is certain that, as a branch of the great Aryan family, he belongs to a highly gifted and intellectual race.

Two of the most striking peculiarities of the social condition of the Hindus are the institution of Caste (q. v.) and the *Village-system*. The latter is very simple. A village in Hindustan does not mean a collection of houses at a particular spot, but corresponds rather to what is called a township in America. It is a district embracing an area of some hundreds or thousands of acres of land, and is under the administration of native functionaries, the principal of whom is the *potail* (head-inhabitant), a kind of chief magistrate, who superintends the affairs of the community, settles disputes, attends

to the police and the collection of taxes. Among the other functionaries may be mentioned the *curmum*, who keeps a register of the produce and the names of the proprietors, and draws up all deeds of sale, transfer, &c.; the Brahman, or village priest; and the schoolmaster. Besides these, every village has its astrologer, smith, carpenter, potter, barber, doctor, dancing-girl, musician, and poet, all of whom are rewarded for their labours out of the produce of the village lands. 'Under this simple form of municipal government, the inhabitants of the country have lived from time immemorial. The boundaries of the village have been but seldom altered; and though the villages themselves have been sometimes injured, and even desolated, by war, famine, and disease, the same name, the same limits, and even the same families, have continued for ages. The inhabitants give themselves no trouble about the breaking up and division of kingdoms; while the village remains entire, they care not to what power it is transferred, or to what sovereign it devolves; its internal economy remains unchanged; the potail is still the head-inhabitant, and still acts as the petty judge and magistrate, and collector or renter of the village.'

To the present inhabitants of I., including people who must now be viewed as so many distinct nations, no general statement can apply. The slothful and cringing Bengali resembles little the warlike Sikh of the Punjab, or the fierce Afghan of Rohilcund; and the patient weaver of Dacca is wholly unlike the high-spirited Rajpūt of Central India. The Sikh is a born soldier, who despises the Hindu, and hates the Mussulman. He cares nothing for caste, and is brave, faithful, and independent. The Mohammedans of I. are degenerate followers of the Prophet, and their religion is a strange mixture of the doctrines of the Koran with the idolatry of Asia. The *aboriginal* tribes number about 20,000,000, and exist in the mountainous districts, in jungles, or the outskirts of towns, under the names of Bheels, Santals, Gonds or Khonds, Koles, Bengies, Domes, and Bhāts. The two most important are the Bheels, who are found in Candeish, and the Khonds and Koles, who inhabit Orissa. The former were wont to live by plunder, and used to burst out of their jungles like tigers, committing the most frightful excesses; but in 1825, after various methods of subduing them had been unsuccessfully tried by the British government, it was resolved to tempt them into military service. A Bheel corps was raised, into which all the wilder spirits were drafted, and the result has been a very decided improvement in the habits and disposition of the rest of the people. Roads have now been made through their country, and property is quite safe. The Khonds and Koles, however, are perhaps a more interesting race, since they have preserved more completely what may be regarded as the primitive religion of Hindustan. Forced into the jungles and mountains of Central I. by the victorious advance of the Aryan race from the north-west, they have preserved (in part at least), in their almost inaccessible retreats, the grim religion that prevailed in the peninsula before Brahmanism was heard of. That religion may be briefly characterised as Devil-worship. The Khonds sacrifice only to malignant deities, such as Siva the Destroyer, the goddess Kali, and the God of the Earth, whom they seek to propitiate by human sacrifice, principally of children, who, however, are not taken from their own race, but kidnapped from neighbouring tribes. Efforts have been made by the British government to suppress this horrid practice, but it still exists.

The Parsees, a mercantile and educated class,

seated at Bombay, and along the west coast of I., are the descendants of the fugitive fire-worshippers of Persia (see PARSEES). It is estimated that the total population of I. approaches 200,000,000 people. 'It may be assumed,' says Mr Montgomery Martin, 'that out of the alleged 200,000,000, 20,000,000 are of the aboriginal class, slaves, pariahs, or devoid of caste; the Mohammedans may number from 12,000,000 to 15,000,000; the Sikhs (on or near the Sutlej) about 2,000,000; the Jains, about 5,000,000; sundry others, hill-tribes, &c., perhaps 8,000,000; and the remaining 150,000,000, Hindus of the Brahmanical creed.'

Religion.—Several of the forms of religion prevalent among the natives of I. are treated of apart (see BUDDHISM, MOHAMMEDANISM, PARSEES); what we have to consider here is that variety of creeds which is derived from Brahmanic sources, and known as the Hindu religion, or Hinduism. The term Hinduism, however, must not be taken as restricted to those forms of the Brahmanic religion which are in existence now; we have to look upon it as comprising all the phases of this creed up to its earliest period.

We may divide Hinduism into three great periods, which, for brevity's sake, we will call the Vedic, Epic, and Purānic periods, as our knowledge of the first is derived from the sacred books called the *Veda*; of the second, from the epic poem called the *Rāmāyana*, and more especially from the great epos, the *Mahābhārata*; while the chief source of our information relative to the last period is that class of mythological works known under the name of *Purānas* and *Tantras*. It is necessary here to guard the reader against attempting to connect dates with the earlier of those periods. It has not been uncommon for writers on this subject to assign thousands of years before the Christian era as the starting-points of various phases of Hindu antiquity; others, more cautious, marked the beginnings of certain divisions of Vedic works with 1200, 1000, 800, and 600 years B. C. The truth is, that while Hindu literature itself is almost without known dates, owing either to the peculiar organisation of the Hindu mind, or to the convulsions of Indian history, the present condition of Sanscrit philology does not afford the scholar the requisite resources for embarking with any chance of success in such chronological speculations. This question of Hindu chronology will be more particularly considered in the article VEDA. In the meantime, the utmost stretch of assumption which in the actual condition of Sanscrit philology it is permitted to make is, that the latest writings of the Vedic class are not more recent than the 2d c. before Christ. A like uncertainty hangs over the period at which the two great epic poems of I. were composed, although there is reason to surmise that the lower limits of that period did not reach beyond the beginning of the Christian era. The Purānic period, on the other hand, all scholars are agreed to regard as corresponding with part of our medieval history.

If the *Rig-Veda*—the oldest of the Vedas, and probably the oldest literary document in existence—coincided with the beginning of Hindu civilisation, the popular creed of the Hindus, as depicted in some of its hymns, would reveal not only the original creed of this nation, but throw a strong light on the original creed of humanity itself. Unhappily, however, the imagination, indulging in such an hypothesis, would have as little foundation to work on as that which would fix the chronological position of this Veda. The Hindus, as depicted in these hymns, are far removed from the starting-point of human society; nay, they may fairly claim to be ranked among those already civilised communities experienced in arts, defending

their homes and property in organised warfare, acquainted even with many vices which only occur in an advanced condition of artificial life. See VEDA. Yet in examining the ideas expressed in the greatest number of the Rig-Veda hymns, it cannot be denied that they are neither ideas engendered by an imagination artificially influenced, nor such as have made a compromise with philosophy. The Hindu of these hymns is essentially engrossed by the might of the elements. The powers which turn his awe into pious subjection and veneration are—*Agni*, the fire of the sun and lightning; *Indra*, the bright, cloudless firmament; the *Maruts*, or winds (see MARUT); *Sūrya*, the sun (see SŪRYA); *Ushas*, the dawn (see USHAS); and various kindred manifestations of the luminous bodies, and nature in general. He invokes them, not as representatives of a superior being, before whom the human soul professes its humility; not as superior beings themselves, which may reveal to his searching mind the mysteries of creation or eternity, but because he wants their assistance against enemies—because he wishes to obtain from them rain, food, cattle, health, and other worldly goods. He complains to them of his troubles, and reminds them of the wonderful deeds they performed of yore, to coax them, as it were, into acquiescence and friendly help. 'We proclaim eagerly, *Maruts*, your ancient greatness, for the sake of inducing your prompt appearance, as the indication of (the approach of) the showerer of benefits;' or: 'Offer your nutritious viands to the great hero (*Indra*), who is pleased by praise, and to *Vishnu* (one of the forms of the sun), the two invincible deities who ride upon the radiant summit of the clouds as upon a well-trained steed. *Indra* and *Vishnu*, the devout worshipper glorifies the radiant approach of you two who are the granters of desires, and who bestow upon the mortal who worships you an immediately receivable (reward), through the distribution of that fire which is the scatterer (of desired blessings).' Such is the strain in which the Hindu of that period addresses his gods. He seeks them, not for his spiritual, but for his material welfare. Ethical considerations are therefore foreign to these instinctive outbursts of the pious mind. Sin and evil, indeed, are often adverted to, and the gods are praised because they destroy sinners and evil-doers; but one would err in associating with these words our notions of sin or wrong. A sinner, in these hymns, is a man who does not address praises to those elementary deities, or who does not gratify them with the oblations they receive at the hands of the believer. He is the foe, the robber, the demon—in short, the borderer infesting the territory of the 'pious' man, who, in his turn, injures and kills, but, in adoring Agni, Indra, and their kin, is satisfied that he can commit no evil act. Yet we should be likewise wrong did we judge of those acts of retaliation by the standard of our own ethical laws. So far, indeed, from reflecting unfavourably on the internal condition of the Hindu community, the features of which may be gathered from these hymns, they seem, on the contrary, to bespeak the union and brotherhood which existed amongst its members; and the absence, in general, of hymns which appeal to the gods for the suppression of internal dissensions or public vices, bears, apparently, testimony to the good moral condition of the people whose wants are recorded in these songs.

It may be imagined that the worship of elementary beings like those we have mentioned was originally a simple and harmless one. By far the greatest number of the Rig-Veda hymns know of but one sort of offering made to these gods; it consists of the juice of the Soma or moon-plant,

which, expressed and fermented, was an exhilarating and inebriating beverage, and for this reason, probably, was deemed to invigorate the gods, and to increase their beneficial potency. It was presented to them in lades, or sprinkled on the sacred Kusa grass. Clarified butter, too, poured on fire, is mentioned in several hymns as an oblation agreeable to the gods; and it may have belonged to this, as we hold, primitive stage of the Vedic worship.

There is a class of hymns, however, to be found in the Rig-Veda which depart already materially from the simplicity of the conceptions we are referring to. In these, which we conceive to be of another order, this instinctive utterance of feeling makes room for the language of speculation; the allegories of poetry yield to the mysticism of the reflecting mind; and the mysteries of nature becoming more keenly felt, the circle of beings which overawe the popular mind becomes enlarged. Thus, the objects by which Indra, Agni, and the other deities are propitiated, become gods themselves; Soma, especially, the moon-plant and its juice, is invoked as the bestower of all worldly boons. The animal sacrifice—the properties of which seem to be more mysterious than the offerings of Soma, or of clarified butter—is added to the original rites. We will quote a few verses from the second book of the Rig-Veda, which may illustrate the essential difference between this order of hymns and those we alluded to before. It is the horse of the sacrifice which is invoked by the worshipper, and its properties are praised in the following strain:

'Thy great birth, O Horse, is to be glorified; whether first springing from the firmament or from the water, inasmuch as thou hast neighed, for thou hast the wings of the falcon and the limbs of the deer. Trita harnessed the horse which was given by Yama, Indra first mounted him, and Gandharba seized his reins. Vasus, you fabricated the horse from the sun. Thou, horse, art Yama: thou art Aditya, thou art Trita by a mysterious act: thou art associated with Soma. The sages have said there are three bindings of thee in heaven,' &c.

Mystical language like this doubtless betrays the aberration of the religious instinct of a nation; but it also reveals the fact, that the pious mind of the Hindus was no longer satisfied with the adoration of the elementary or natural powers; it shews that religion endeavoured to penetrate into the mysteries of creation. This longing we find, then, expressed in other hymns, which mark the beginning of the *philosophical creed of the Vedic period*. The following few verses may tend to illustrate the nature of this third class of hymns, as they occur in the oldest Veda: 'I have beheld the Lord of Men,' one poet sings, 'with seven sons [i.e., the seven solar rays], of which delightful and benevolent (deity), who is the object of our invocation, there is an all-pervading middle brother, and a third brother [i.e., Vāyu and Agni, the younger brothers of Aditya, the sun], well fed with (oblations of) clarified butter. They yoke the seven (horses) to the one-wheeled car [i.e., the orb of the sun, or time, or a year]; one horse [i.e., the sun], named seven, bears it along: the three-axled wheel [i.e., the day with its three divisions, or the year with three seasons—hot, wet, and cold; or time—past, present, and future] is undecaying, never loosened, and in it all these regions of the universe abide. . . . Who has seen the primeval (Being) at the time of his being born? What is that endowed with substance which the unsubstantial sustains? From earth are the breath and blood, but where is the soul? Who may repair to the soul to ask this? Immature (in understanding), undiscerning in mind, I inquire of those things

which are hidden, (even) from the gods, (what are) the seven threads which the sages have spread to envelop the sun in whom all abide?' Another poet sings: 'Then there was no entity or non-entity; no world, or sky, or aught above it; nothing anywhere in the happiness of any one, involving or involved; nor water deep or dangerous. Death was not, nor was there immortality, nor distinction of day or night. But *That* breathed without affilation, single with her (*Svadhā*) who is within him. Other than him, nothing existed (which) since (has) been. . . . Who knows exactly, and who shall in this world declare, whence and why this creation took place? The gods are subsequent to the production of this world, then who can know whence it proceeded, or whence this varied world arose, or whether it uphold itself or not? He who in the highest heaven is the ruler of this universe, does indeed know; but not another one can possess this knowledge.'

As soon as the problem implied by passages like these was raised in the minds of the Hindus, Hinduism must have ceased to be the pure worship of the elementary powers. Henceforward, therefore, we see it either struggling to reconcile the latter with the idea of one supreme being, or to emancipate the inquiry into the principle of creation from the elementary religion recorded in the oldest portion of Vedic poetry. The first of these efforts is principally shewn in that portion of the Vedas called *Brāhmana* (see *VEDA*), the second in the writings termed *Upanishad* (see *UPANISHAD*). In the *Brāhmanas*—a word of the neuter gender, and not to be confounded with the similar word in the masculine gender, denoting the first Hindu caste—the mystical allegories which now and then appear in what we have called the second class of Vedic hymns, are not only developed to a considerable extent, but gradually brought into a systematic form. Epithets given by the Rig-Veda poets to the elementary gods are spun out into legends, assuming the shape of historical narratives. The simple and primitive worship mentioned in the hymns becomes highly complex and artificial. A ponderous ritual, founded on those legends, and supported by a far more advanced condition of society, is brought into a regular system, which requires a special class of priests to be kept in a proper working order. Some of the Vedic hymns seem to belong already to the beginning of this period of the *Brāhmana* worship, for in the second book of the Rig-Veda several such priests are enumerated in reference to the adoration of Agni, the god of fire; but the full contingent of sixteen priests, such as is required for the celebration of a great sacrifice, does not make its appearance before the composition of the *Brāhmanas* and later Vedas. Yet, however wild many of these legends are, however distant they become from the instinctive veneration of the elementary powers of nature, and however much this ritual betrays the gradual development of the institution of castes—unknown to the hymns of the Rig-Veda—there are still two features in them, which mark a progress of the religious mind of ancient India. While the poets of the Rig-Veda are chiefly concerned in glorifying the *visible* manifestations of the elementary gods—in the *Brāhmanas*, their ethical qualities are put forward for imitation and praise. Truth and untruth, right and wrong—in the moral sense which these words imply—are not seldom emphasised in the description of the battles fought between gods and demons; and several rites themselves are described as symbolical representations of these and similar qualities of the good and evil beings, worshipped or abhorred. A second feature is the tendency, in these *Brāhmanas*, of

determining the rank of the gods, and as a consequence, of giving prominence to one special god amongst the rest; whereas in the old Vedic poetry, though we may discover a predilection of the poets to bestow more praise, for instance, on Indra and Agni, than on other gods, yet we find no intention, on their part, to raise any of them to a supreme rank. Thus, in some Brāhmanas, *Indra*, the god of the firmament, is endowed with the dignity of a ruler of the gods; in others, the *sun* receives the attributes of superiority. This is no real solution of the momentous problem hinted at in such Vedic hymns as we quoted before, but it is a semblance of it. There the poet asks 'whence this varied world arose'—here the priest answers that 'one god is more elevated than the rest,' and he is satisfied with regulating the detail of the Soma and animal sacrifice, according to the rank which he assigns to his deities.

A real answer to this great question is attempted, however, by the theologians who explained the 'mysterious doctrine,' held in the utmost reverence by all Hindus, and laid down in the writings known under the name of *Upanishads*. It must suffice here to state that the object of these important works is to explain, not only the process of creation, but the nature of a supreme being, and its relation to the human soul. In the *Upanishads*, Agni, Indra, Vāyu, and the other deities of the Vedic hymns, become symbols to assist the mind in its attempt to understand the true nature of one absolute being, and the manner in which it manifests itself in its worldly form. The human soul itself is of the same nature as this supreme or great soul: its ultimate destination is that of becoming re-united with the supreme soul, and the means of attaining that end is not the performance of sacrificial rites, but the comprehension of its own self and of the great soul. The doctrine which at a later period became the foundation of the creed of the educated—the doctrine that the supreme soul, or (the neuter) Brahman, is the only reality, and that the world has a claim to notice only in so far as it emanated from this being, is already clearly laid down in these *Upanishads*, though the language in which it is expressed still adapts itself to the legendary and allegorical style which characterises the Brāhmana portion of the Vedas. *The Upanishads became thus the basis of the enlightened faith of India*. They are not a system of philosophy, but they contain all the germs whence the three great systems of Hindu philosophy arose; and like the latter, while revealing the struggle of the Hindu mind to reach the comprehension of one supreme being, they advance sufficiently far to express their belief in such a being, but at the same time acknowledge the inability of the human mind to comprehend its essence. For the different periods which must be distinguished in the composition of these works, and for the gradual development of the general ideas briefly adverted to here, we refer the reader to the article UPANISHAD.

The Epic period of Hinduism is marked by a similar development of the same two creeds, the general features of which we have now traced in the Vedic writings. The popular creed strives to find a centre round which to group its imaginary gods, whereas the philosophical creed finds its expression in the groundworks of the *Sāṅkhya*, *Nyāya*, and *Vedānta* systems of philosophy. In the former, we find two gods in particular who are rising to the highest rank, Vishnu and Siva; for as to Brahmā (the masculine form of Brahman), though he was looked upon, now and then, as superior to both, he gradually disappears, and becomes merged into the philosophical Brahma (the neuter form of

the same word), which is a further evolution of the great soul of the *Upanishads*. In the *Rāmāyana*, the superiority of Vishnu is admitted without dispute; in the great epos, the *Mahābhārata*, however, which, unlike the former epos, is the product of successive ages, there is an apparent rivalry between the claims of Vishnu and Siva to occupy the highest rank in the pantheon; but Sanscrit philology will first have to unravel the chronological position of the various portions of this work, to lay bare its groundwork, and to shew the gradual additions it received, before it will be able to determine the successive formation of the legends which are the basis of classical Hindu mythology. Yet so much seems to be clear even already, that there is a predilection during this Epic period for the supremacy of Vishnu; and that the policy of incorporating rather than combating antagonistic creeds, led more to a quiet admission, than to a warm support of Siva's claims to the highest rank. For the character of these gods, for the relation in which the conception of these beings stands to that of the Vedic time, for the new ideas which they impersonate at the Epic period, and for the group of mythological beings connected with both of them, we refer the reader to the respective articles. We will point, however, to one remarkable myth, as it will illustrate the altered position of the gods during the Epic period. In the Vedic hymns, the immortality of the gods is never matter of doubt; most of the elementary beings are invoked and described as everlasting, as liable neither to decay nor death. The offerings they receive may add to their comfort and strength; they may invigorate them, but it is nowhere stated that they are indispensable for their existence. It is, on the contrary, the pious sacrificer himself who, through his offerings, secures to himself long life, and, as it is sometimes hyperbolically called, immortality. And the same notion prevails throughout the oldest Brāhmanas. It is only in the latest work of this class, the *S'atapatha-Brāhmana*, and more especially in the Epic poems, that we find the inferior gods as mortal in the beginning, and as becoming immortal through exterior agency. In the *S'atapatha-Brāhmana*, the juice of the Soma plant, offered by the worshipper, or at another time clarified butter, or even animal sacrifices, impart to them this immortality. At the Epic period, Vishnu teaches them how to obtain the *Amrita*, or beverage of immortality, without which they would go to destruction; and this epic *Amrita* itself is merely a compound, increased by imagination, of the various substances which in the Vedic writings are called or likened to *Amrita*, i. e., a 'substance that frees from death.' It is obvious, therefore, that gods like these could not strike root in the religious mind of the nation. We must look upon them more as the gods of poetry than of real life; nor do we find that they enjoyed any of the worship which was allotted to the two principal gods, Vishnu and Siva.

The philosophical creed of this period adds little to the fundamental notions contained in the *Upanishads*; but it frees itself from the legendary dross which still imparts to those works a deep tinge of mysticism. On the other hand, it conceives and develops the notion, that the union of the individual soul with the supreme spirit may be aided by penances, such as peculiar modes of breathing, particular postures, protracted fasting, and the like; in short, by those practices which are systematised by the Yoga doctrine. The most remarkable Epic work which inculcates this doctrine is the celebrated poem *Bhagavadgītā*, which has been wrongly considered by European writers as a pure Sāṅkhya work, whereas *S'ankara*, the great Hindu theologian,

who commented on it, and other native commentators after him, have proved that it is founded on the Yoga belief. The doctrine of the reunion of the individual soul with the supreme soul, was necessarily founded on the assumption, that the former must have become free from all guilt affecting its purity before it can be re-merged into the source whence it proceeded; and since one human life is apparently too short for enabling the soul to attain its accomplishment, the Hindu mind concluded that the soul, after the death of its temporary owner, had to be born again, in order to complete the work it had left undone in its previous existence, and that it must submit to the same fate until its task is fulfilled. This is the doctrine of *metempsychosis*, which, in the absence of a belief in grace, is a logical consequence of a system which holds the human soul to be of the same nature as that of an absolute God. The beginning of this doctrine may be discovered in some of the oldest Upanishads, but its fantastical development belongs to the Epic time, where it pervades the legends, and affects the social life of the nation. See *METEMPSYCHOSIS*.

The *PURĀNIC* period of Hinduism is the period of its decline, so far as the popular creed is concerned. Its pantheon is nominally the same as that of the Epic period. Brahmā, Vishnu, and Siva remain still at the head of its imaginary gods; but whereas the Epic time is generally characterised by a friendly harmony between the higher occupants of the divine spheres, the *Purānic* period shews discord and destruction of the original ideas whence the Epic gods arose. Brahmā withdraws, in general, from the popular adoration, and leaves Vishnu and Siva to fight their battles in the minds of their worshippers for the highest rank. The elementary principle which originally inhered in these deities is thus completely lost sight of by the followers of the *Purānas*. The legends of the Epic poems relating to these gods become amplified and distorted, according to the sectarian tendencies of the masses; and the divine element which still distinguishes these gods in the *Rāmāyana* and *Mahābhārata*, is now more and more mixed up with worldly concerns and intersected with historical events, disfigured in their turn to suit individual interests. Of the ideas implied by the Vedic rites, scarcely a trace is visible in the *Purānas* and *Tantras*, which are the text-books of this creed. In short, the unbridled imagination which pervades these works is neither pleasing from a poetical, nor elevating from a philosophical point of view. Some *Purānas*, it is true—for instance, the *Bhāgavata*—make in some sense an exception to this aberration of original Hinduism; but they are a compromise between the popular and the *Vedānta* creed, which henceforward remains the creed of the educated and intelligent. They do not affect the worship of the masses as practised by the various sects; and this worship itself, whether harmless, as with the worshippers of Vishnu, or offensive, as with the adorers of Siva and his wife Durgā, is but an empty ceremonial, which, here and there, may remind one of the symbolical worship of the Vedic Hindu, but, as a whole, has no connection whatever with the Vedic scriptures, on which it affects to rest. It is this creed which, with further deteriorations, caused by the lapse of centuries, is still the main religion of the masses in India. The opinion these entertain, that it is countenanced by the ritual, as well as by the theological portion of the *Vedas*, is the redeeming feature of their belief; for, as nothing is easier than to disabuse their mind on this score, by reviving the study of their ancient and sacred language, and by enabling them to read again their oldest and most sacred books, it may be hoped that a proper

education of the people in this respect, by learned and enlightened natives, will remove many of the existing errors, which, if they continued, must inevitably lead to a further and, ultimately, total degeneration of the Hindu race.

The philosophical creed of this period, and the creed which is still preserved by the educated classes, is that derived from the tenets of the *Vedānta* philosophy. It is based on the belief of one supreme being, which imagination and speculation endeavour to invest with all the perfections conceivable by the human mind, but the true nature of which is, nevertheless, declared to be beyond the reach of thought, and which, on this ground, is defined as not possessing any of the qualities by which the human mind is able to comprehend intellectual or material entity. See *VEDĀNTA*.

Hindu Sects.—This designation applies to the sects which arose during the third period of Hinduism. They suppose that their worship is countenanced by the *Vedas*; but its real origin is derived from the *Purānas* and *Tantras*. See these articles. There are three chief divisions of these sects—the adorers of Vishnu, of Siva, and of the wives or female energies of these gods. See *VAISHNAVAS*, *SAIVAS*, and *SĀKTAS*. Besides these great sects, there are some of limited extent and total insignificance, such as the worshippers of *Agni*, the god of fire; of *Sūrya*, the sun-god; of *Ganesa*, the god of wisdom, and the obviator of impediments. For a detailed account of these and similar sects, see the first volume of the *Works of the late H. H. Wilson*, containing a Sketch of the Religious Sects of the Hindus.

Languages.—A great many different tongues and dialects are spoken in this vast country. The languages spoken in the north of India, by the Hindus proper, are descended from the ancient Sanscrit (q. v.). The chief dialects are: Hindi, the principal literary language of the non-Mohammedan population; Hindustani, or Urdu, which is Hindi corrupted by a mixture of Arabic and Persian words; Bengali; Punjabi; Mahratti; Gujeratti; &c. The languages of the Deccan have only a slight infusion of Sanscrit roots, and are more akin to the Tartar languages of Central Asia. They are called the Dravidian group, and include Tamil, Telugu, Malayalam, and Canarese. The languages of the hill-tribes or aborigines have not hitherto been sufficiently examined, to warrant any conclusions with regard to their affinity.

Manufactures and Arts.—In manufactures, the Hindus attained to marvellous perfection at a very early period, and the courts of imperial Rome glittered with the gold and silver brocades of Delhi. The muslins of Dacca were famous ages ago throughout the civilised world. In the International Exhibition of 1862, splendid specimens of the gorgeous manufactures and patient industry of the Hindus were displayed. Textile fabrics of inimitable fineness; tapestry glittering with gems; rich embroideries and brocades; carpets wonderful for their exquisite harmony of colour; silver filigree-work, fine and delicate as lace; enamel of the most brilliant hue; inlaid wares that require high magnifying power to reveal their minuteness; cups and goblets of chaste design; furniture most elaborately carved; swords of curious form and excellent temper, are amongst the objects that prove the perfection of the art-industry of India. All these are produced with the rudest tools, and without any factories, in the European sense of the word. The Hindu, though excessively dexterous, is totally devoid of ingenuity. Arts and manufactures have consequently made no progress in I. for the last 1000 years. The system of caste has led to the

INDIA.

regular hereditary transmission of professions from generation to generation, and the traditions of each craft have thus been handed down from father to son, as we at present find them in practice.

In *Agriculture*, the Hindus evince considerable skill, and though their system is in many respects rude, it appears well suited to the country. They have practised it from very remote times, for even during the Vedic period they cultivated *fields*, and removed the produce in carts. The native farmers alternate the pulses with the cereals, and Dr Royle is of opinion that the system of rotation of crops has been derived from India. The Hindu farmer understands extremely well how to maintain the producing power of his land.

History. See following article.

INDIA, BRITISH, includes not only almost the whole of the country described in the preceding

article, but also several provinces on the eastern side of the Bay of Bengal. It extends from the gloomy passes and cyclopean gates that shut in Hindustan on the north and north-east to Cape Comorin, about 1800 miles; and from Kurrachi in Sind to Rangūn in Pegu, about 1900 miles. Its area is fully 1,500,000 square miles, with a land boundary of about 4500 miles, and a coast-line of almost equal extent.

For administrative purposes, the various countries and provinces of British India are grouped into several local governments, under governors, lieutenant-governors, and commissioners, all of whom are subject to the supreme authority of the governor-general. There are at the present time three presidencies—Bengal, Madras, and Bombay; four lieutenant-governorships—the North-west Provinces, the Punjab, Oude, and British Burmah; and besides these, Nagpur or Berar, together with Saugor and the Nerbudda territories, form a central province governed by a commissioner. The following table, abridged from Montgomery Martin's *British India*, shews the

STATE OF BRITISH INDIA IN THE YEAR 1859–1860.

Government, Civil and Military.—The act for the better government of India (21 and 22 Vict. c. 106) received the royal assent August 2, 1858; and on the 1st of November in the same year, a royal proclamation signified to the people of I. that the hundred years' reign—the mysterious 'raj'—of the East India Company had terminated, and that the Queen of England was henceforth to be Empress of Hindustan, governing by her vice-regent the territories lately ruled by the great Company. The anomalous double government of I. by a court of East India Directors and a Board of Control, composed of Queen's ministers, having ceased, it will be unnecessary to enter into details respecting its organisation. The following sketch of the government of I., as at present constituted, its finance, moral and material progress, and present condition, is derived chiefly from Montgomery Martin's *Progress and Present State of British India* (1862).

The Home Government for I. is vested in a secretary of state (salary, £5000) and a council of fifteen members (salary of each, £1200). The

secretary, who is independent of the council, is assisted by an under-secretary (salary, £2000), a member of the legislature, and both lose office with the cabinet, of which the secretary of state is a member. There are, besides, a permanent under-secretary and an assistant-secretary (salary, £1500). The total annual cost of the home establishment, including salaries to subordinates, is about £150,000.

The Local and Executive Government is administered by a governor-general or viceroy, governors, lieutenant-governors, and commissioners. The governor-general, who holds an office the highest filled by an uncrowned head, is appointed by the crown for a term of about six years, with a salary of £25,000 per annum, independently of a palace and establishment at Calcutta, and a country residence at Barrackpore. He is assisted by a council of five ordinary members, who may be regarded as his ministers. Three of these are appointed by the secretary of state in council from servants of the Crown or Company of ten years' standing, and the remaining two by her Majesty's warrant. The commander-in-chief may be constituted an extraordinary member of council by the secretary of state. There is, besides, a financial member of the supreme government, a kind of chancellor of the Indian exchequer. The executive council becomes a legislative council by the addition of from six to twelve members, one half of whom must be non-official, nominated for two years by the governor-general. The new legislative council assembled in January 1862, and included five non-official European gentlemen and three natives of India.

The governors of Madras and Bombay may also appoint each a legislative council of from four to eight members. Legislative councils met at both these presidencies in January 1862. The assent of the governor-general is required to render valid the measures passed by the governors of Madras and Bombay in council, and they are further subject to the veto of the Crown. The lieutenant-governor of Bengal, who rules 40,000,000 of people, is also assisted by a legislative council, consisting of four official, four non-official, and three native members; and similar councils will shortly be organised in the North-west Provinces, the Punjab, and probably in Oude. A more generous policy towards the natives of I. than has hitherto been our custom has already been partially adopted with marked success, and its gradual extension, while securing their fidelity to the British crown, will offer to native talent an honourable employment in the administration of civil affairs, a vocation open to the Hindu aristocracy even under the rule of the Mogul.

The Administration of the Native States is generally vested in an hereditary and despotic prince, aided, it may be, by a council of nobles, and controlled in some degree by a British resident. The British government have lately conceded to the native independent princes of I. the right of adoption in regard to succession on failure of natural heirs. This act practically reverses the policy of annexation which has hitherto been the rule in I., and which has mainly contributed to the enormous increase of our territories of late years, especially under the administration of Lord Dalhousie.

The Covenanted Civil Service is composed of Europeans who conduct the general administration of British India. It includes about 800 members, with salaries ranging from £300 to £8000 per annum. The patronage of the Covenanted Civil and Military Services was until lately a monopoly of the East India Company, but the staff of the Covenanted Civil Service is now recruited from the successful

candidates at competitive examinations, instituted for the purpose. The successful administration of I. is of great and growing importance to Great Britain, for the loss of I., besides depriving the educated middle classes of Great Britain of a fine field for their energies and talents, would involve the loss of the debt of I., which amounts to £120,000,000, besides £50,000,000 invested in Indian railways, both sums derived chiefly from British capitalists. £20,000,000 more are embarked in banks and joint-stock mercantile associations.

The Uncovenanted Civil Service, appointments to which are made by the authorities in I., is composed of Europeans, Eurasians (the class sprung from native mothers by European fathers), and natives, with salaries ranging from £12 to £3000 per annum. Candidates are not subjected to the examinations through which those who enter the Covenanted branch must pass. In the year 1861, the service included 6212 members, of whom 3984 were Europeans and Eurasians, and 2228 natives of India.

Military Force.—The Indian military service, like the civil service, has been undergoing a thorough reorganisation, consequent on the great mutiny, and the transfer of the government of the country from the East India Company to the Crown. In 1857, at the outbreak of the mutiny, the Indian Army (q. v.) consisted of about 277,000 men, of whom 45,000 were Europeans and 232,000 natives. During the mutiny, the native army of Bengal was almost entirely broken up. Fifteen regiments of regular native infantry, the local infantry, the Gürkha and irregular line regiments, eight regiments of irregular cavalry, and the sappers and miners, were all that remained at the close of 1860 of the old native army of Bengal.

The strength and cost of European troops in I. for 1862 were :

	Strength.	Cost.
Bengal,	44,916	£4,940,760
Madras,	15,161	1,667,710
Bombay,	13,509	1,485,000
Total,	73,586	£8,093,470

There are more than 3000 European officers attached to the army in I., and 800 commissioned medical officers. Great reductions have taken place in the regular native army, which now numbers about 120,000 men.

The Police, civil and military, forms an important force, and is to a great extent taking the place of the regular army. In Bengal, for instance, the military police includes ten battalions of infantry, each 700 strong; three squadrons of cavalry, and some local levies; in all, about 10,000 men, of various races, with forty European officers. The whole police force of I. has lately been re-organised on one uniform system, with a central organisation of its own in each presidency.

Marine Department.—There is no longer a separate Indian navy, but a Pilot Service is still maintained.

Administration of Civil Justice.—This, like everything else in I., is in a state of transition. The supreme court at Calcutta, and the Sudder Mofussil, or county courts, were abolished in 1861, by an act of parliament, and high courts of judicature were established at each presidency and in the North-west Provinces, under the control of a chief-justice, and as many other judges, not exceeding fifteen, as her Majesty may appoint. 'These high courts are to exercise civil, criminal, admiralty, testamentary, intestate, and matrimonial jurisdiction, original and appellate, by single judges or by division courts;' and now, for the first time, the verdicts of the inferior courts will be submitted to men of high

legal knowledge. In the three presidential cities, trial by jury has long been customary, and here English laws are in force; but no code of civil or criminal law for I. generally has yet been promulgated.

Revenue, Expenditure, &c.—The annexed table shews the gross revenue from 1800 to 1860:

Year.	Bengal.*	Madras.	Bombay.	Total.
	£	£	£	£
1800	6,658,334	3,540,268	286,457	10,485,059
1810	10,682,249	5,238,576	758,372	16,679,197
1820	13,547,423	5,403,506	2,401,312	21,352,241
1850	18,167,455	5,087,333	4,430,772	27,625,360
1860	23,877,178	6,550,980	7,277,664	39,705,822

It will be seen that land, opium, and salt form the three principal sources of revenue, the land-tax alone producing the half of the whole. In I. the government has always been considered the owner of the soil, and the actual cultivators pay a rent or tax, in collecting which different systems have hitherto been followed in different parts of the country, known as the *Zemindari Settlement*, *Ryotwar*, and *Mouzarwar* or *Village Settlement*. The latter is the oldest and the simplest system. Each village under this arrangement was regarded as a separate municipality, and each was assessed by the government at a particular sum, for the due payment of which the headman of the village was considered responsible. The individual distribution of the burden of taxation rested with the village authorities, and government, provided it received its regular dues through the *potail*, interfered no further. The origin of the *Zemindari* and *Ryotwar* Settlements requires some explanation. When the English first entered upon the administration of the country, they found that the practice of native sovereigns, their predecessors, had been to farm out the land revenues of the country to the nobles of the court, or to wealthy bankers, who annually paid a fixed amount into the royal treasury, and collected the government dues on their own behalf, from the actual cultivators of the soil. These farmers of the revenue were termed *Zemindars*. The question for the English rulers arose, whether or not they were to consider these men as proprietors. In Bengal, they were so recognised, and confirmed in their position, the government holding them responsible for the payment of the dues on their estates, and regarding the cultivators on the farms as their tenants. This was Lord Cornwallis's *Zemindari Settlement*. In Madras and Bombay, the precisely opposite course was pursued. The claims of the middlemen, or farmers

of the revenue, to enjoy any proprietary rights was totally ignored; and under Sir Thomas Munro, the ryotwar system was introduced, by which government makes a separate settlement with each individual cultivator or *ryot*, who is recognised as the virtual proprietor of the land, or tenant direct under government, so long as he pays the land-tax annually charged on his estate or farm. A complete land survey by government officials is at present in progress in India, and in conjunction with this it is proposed in future to settle the land-tax uniformly on a permanent basis. A most important recent measure sanctions the sale in fee simple of waste lands in certain districts, as well as lands for building purposes.

Opium (q. v.) is produced in large quantities, sometimes amounting to 50,000 chests a year, but this is a constantly fluctuating source of revenue. Salt, as an article in very general use, forms a convenient and productive item of taxation. A property-tax of 3 per cent. (which is now under revision) was levied on 31st July 1860, and a personal tax of 1 per cent. is charged on every one engaged in business in any presidency town. For the year 1860—1861, the gross receipts of the revenues of India amounted to £42,903,234. The total expenditure of that year, including guaranteed interests on the capital of railway and other companies, amounted to £46,924,619; shewing an excess of expenditure over income of £4,021,385. (See Finance and Revenue Accounts of the Government of India for the year 1860—1861.) As a result of recent reforms, and the finance measures of Mr Wilson and his successor, Mr Laing, the deficit has been changed into a surplus, in the year 1862—1863, of £1,428,623, and the expenditure in I. is reduced to £35,905,521. In 1860 the debt of I. was £98,107,460—viz., in I., £71,969,460; and in England, £26,138,000. The cost of the great mutiny, to the end of the financial year 1859—1860, including losses, destruction of public buildings, and probable amount of compensation to sufferers, is estimated at about £29,000,000 sterling.

Currency.—In British I., accounts are kept in rupees, annas, and pie—16 annas going to the rupee, and 12 pie to the anna. The coins are rupees (value 2s. sterling) and half and quarter and half-quarter rupees, in silver; and in copper, $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{16}$ of an anna. During the ten years ending 1857—1858, the mints of Calcutta, Madras, and Bombay issued in gold, silver, and copper coins, nearly £56,000,000 sterling. The new coinage bears the impress of the Queen in the native costume. State-notes to the amount of four millions were issued by means of the Bank of Bengal in March 1862.

Moral and Material Progress—Religion and Education.—In Queen Victoria's Proclamation to the Princes, Chiefs, and People of India, read in the principal cities of India, November 1, 1858, it was declared, 'that none shall be in anywise favoured, none molested or disquieted by reason of their religious faith and observances, but that all shall alike enjoy the equal and impartial protection of the law.' The fullest toleration in matters of faith is enjoyed throughout British India. Fanaticism only, as when it seeks to enforce the cruel *sutti*, or offers human beings in sacrifice, is curbed by the ruling power. There is no exclusively endowed state-church, but government continue to pay the state grants made to Hindu temples and to Mohammedan mosques under the past régime, or compromise claims where it is possible by a grant of land or one money payment. Clergymen of the Church of England and of the Church of Scotland are retained on the government establishment as civil and military chaplains. In 1814, a bishop of Calcutta

* Including the North-west Provinces, the Punjab, and the territories under British control.

† Taxes on sale of liquors, drugs, &c.

‡ Tax on houses and trades, levied chiefly in Madras.

was appointed. Bombay and Madras were afterwards provided with bishops, and these sees are maintained at an annual cost of £12,715. The number of chaplains is now 129, with an aggregate allowance of £95,000; Roman Catholic priests receive annually more than £8000 for their services as military chaplains.

The educational system adopted in India has a distinct central organisation in each presidency under a director of public instruction, assisted by inspectors of schools, one to each of the circles into which the presidency is divided. A university has been established at each presidency town; and besides the university, there are two grades of education in the secondary or middle class, and in the primary or popular classes of schools. In Bengal, 18,000 scholars attend the 300 colleges and schools endowed by government. The local annual sum expended on educational purposes is about £100,000. The educational department of Madras is maintained by government at an annual cost of about £50,000. In Bombay, there are 23 English schools, with 3000 scholars, and 500 vernacular schools, with 28,000 scholars, spread over the presidency; besides colleges at Ahmedabad and Belgaum, and an engineering school at Poona. In the North-west Provinces, 10,000 government schools, with 225,000 boys, are in operation, and there are colleges at Agra, Benares, and other cities. The natives manage and maintain 6000 indigenous schools, with 65,000 boys.

Christianity in India.—India was one of the earliest fields of Christian missions. Tradition assigns it as the scene of the apostle Thomas's labours and martyrdom. Whether this was the case or not, we find a Syrian church planted in Malabar in Southern India, which undoubtedly had a very early origin. The Jesuit missionaries, from the middle of the 16th c. onwards, had a large success in India. To disarm prejudice, they are said to have introduced themselves to the notice of the people, not as foreigners, but as white Brahmans, and by fostering the native system of caste, and a large amount of compromise in the way of religious observances, induced great numbers to receive the outward form of Christian baptism; and the number of professing Roman Catholics now in the country is considerable. See XAVIER, FRANCIS. The earliest Protestant missionaries in India came from Holland and Denmark. With the latter mission, the eminent Schwartz was connected. England's first missionary effort was put forward by the Society for the Propagation of the Gospel, and the Christian Knowledge Society, which commenced in the beginning of the 18th c., by aiding the Danish mission already established in Southern India. Subsequently, the East India Company adopted the policy of excluding missionaries altogether from their territories; but since the beginning of this century, when these restrictions were withdrawn, a great work has been entered on, in which all denominations are represented. Progress, however, is necessarily slow. The resolution of government to exclude the Bible from the teaching in its schools, has been the subject of much dispute. By Mr Mullen's census of Indian Missions, taken in 1862, the following results have been ascertained, the number of male and female pupils in the schools being somewhat understated: European missionaries, 418; ordained natives, 81; catechists, 1079; native churches, 890; native Christians, 118,893; communicants, 21,252; boy scholars, 54,888; girl scholars, 14,723.

Medical aid is freely given to Europeans and natives at numerous hospitals and dispensaries. In Bengal, government supports 47 of the latter; in the Madras presidency, 38; and in the Bombay

presidency there are five civil hospitals, and several government dispensaries.

The *railways* now in operation, or in course of construction, are the East Indian, Madras, Great Indian Peninsula, Great Southern of India, Bombay-Baroda and Central India, Eastern Bengal, Sind and the Punjab—giving, when completed, a grand total of 5859 miles. On the 30th June 1860, 1746 miles were open for traffic. Some of the bridges and viaducts on these railways are amongst the finest structures in the world.

There is a weekly communication between England and India by the overland route *via* Egypt and the Red Sea. By going overland to Marseille, thence by steamer and railway to Alexandria and Suez, and thence again by steamer, the journey from London may be accomplished to Bombay in 20–25 days, and to Madras in about a month. The French Messagerie Imperiale have also lately established a new monthly steam-packet service between Marseille and India. Another and more speedy route is proposed *via* the Euphrates Valley and the Persian Gulf.

Roads.—A grand trunk road extends from Peshawur to Calcutta, a distance of 1400 miles. In Bengal, there are 11 imperial trunk roads already formed, or in course of construction, with an aggregate length of 2000 miles; also 1100 miles of imperial branch roads, and more than 600 miles of 'feeders' projected. Tramways in connection with the railways and river-transit are about to be formed. A military frontier-road, 380 miles in length, extends from the Peyzu Pass to the Sind boundary; and from the same pass *via* Bunnu and Bhuhadr Khely to Kohat, a distance of 120 miles. Besides these, there are 152 miles of lesser military roads. A great trunk road from Lahore to Peshawur, 264 miles, estimated to cost more than a million sterling, is in progress, and will be an engineering work of no ordinary grandeur and utility. 'It passes,' says Arnold, 'upon 103 great bridges, and 459 smaller ones, penetrates the heart of six mountainous chains, and crosses on immense embankments the *marais* of two great rivers.' The road sanctioned by Lord Dalhousie, from Kalki, near Umballa, to Simla, and with branches to the hilly stations and sanitarium, is an undertaking of extraordinary magnitude.

Canals and Irrigation.—Rapid communication and a fully developed system of irrigation are still the two great wants of India. Canals have been formed by the upper waters of both the Ganges and the Jumna. See GANGES CANAL. The Ganges gives more than 800 miles of water-course; the West Jumna, 425; and the East Jumna, 155. The famous Bari Doab Canal, between the Sutlej and the Ravi, Lord Dalhousie's gift to the Punjab, will altogether be 466 miles long; the main line extending to 247 miles, and the Lahore, Kussur, and Sobraon branches, to 219 miles: more than 50 miles are completed. The total cost of this magnificent work is estimated at £1,500,000. The profits on all works of public utility in I. are very large.

Telegraphic Communication, which now extends over 11,000 miles, was started during the administration of the Marquis of Dalhousie. It is probable that daily telegraphic communication between London and Calcutta will be shortly established.

Postal Communication extends, in I., over 43,570 miles. The rate of postage, which, in the year 1854–1855, was reduced to half an anna, or three farthings, for a single letter, is lower than in any other country.

The *Public Works Department* undertakes the construction of military, civil, and ecclesiastical buildings, agricultural works, including irrigation canals, and embankments, also roads and bridges.

In the year 1859–1860, the expenditure of this department was £12,159,620, of which £7,206,999 were spent on railways, £172,043 on the electric telegraph, and £4,780,578 on miscellaneous works.

A trigonometrical survey of I. has for some time been in progress, and has already extended over about two-thirds of the country.

Commerce.—The commerce of I., which every year assumes vaster proportions, is capable of almost indefinite extension. According to the returns of 1859–1860, the imports were: merchandise, £24,265,140; treasure, £16,356,963: total, £40,622,103. And the exports for the same year amounted to: merchandise, £27,960,203; treasure, £929,007: total, £28,889,210. I. takes more British goods and manufactures than any other country in the world except the United States of America. About £70,000,000 sterling are now invested in Indian undertakings of a public character.

Colonisation.—In the strict sense of the word, colonisation must ever be impracticable in India on account of the unfavourable character of the climate, for the European race settled in the country rapidly degenerates, and in a few generations becomes effete, and bodily and mentally enervated. A constant stream of British capital, however, and fresh directing energies in its application, is the great want, and what would secure, as nothing else can, the development of its unlimited resources. Indigo and sugar factories, and coffee and tea plantations, have been the principal undertakings in which independent British capital and energy have been hitherto embarked, and the results have been most satisfactory. The failure of the American cotton supply has drawn much attention of late to India. Undoubtedly, India could supply Great Britain with all the cotton she needs; but confidence is required to engage in the speculation of raising it, owing to the uncertainty of the present demand. However that may be, railways, roads, and canals are fast opening up the country; civilisation is making rapid strides, creating new demands for trade; and a better knowledge of local sanitary laws is doing much to lessen the risks of climate. At the same time government, by a wise and liberal policy, is going the right way to establish its claims in the good-will of the native population, and thus secure the stability of British administration; and the restoration of Indian finances to their equilibrium on the principle of reduced expenditure, instead of increased taxation, meets with the approbation of both Europeans and natives. India, therefore, promises before long to offer to capital and energy one of the most profitable and secure fields of investment to be found in any of our colonies or dependencies.

Natural Productions.—Cotton is the most important product of Hindustan. It is estimated that, scattered throughout Hindustan, there are about 24,000,000 acres of land under cotton cultivation. Wool will probably soon become a great Indian staple. The chief supply is from the Himalaya and Afghan regions. Hemp and flax, silk from the high lands, coffee, linseed, tobacco, and indigo, are all valuable productions of British India. The leaves and silver blossoms of the tea-plant are beginning to cover the Himalaya slopes and the hilly districts of Bengal, the North-west Provinces, and the Punjab. Great quantities of rice are raised in Southern I. and British Burmah. The Malabar district, Martaban, and Tenasserim furnish thousands of logs of the best teak timber. The cinchona or quinine plant has lately been introduced on the Neilgherries with great success, the original plants having been brought over from Peru.

History.—The oldest history of I. is entirely

legendary; it is shrouded in mythical narratives, which, though of the highest interest from a religious and archaeological point of view, do not enlighten us as to the dates of the personages concerned, nor as to the reality of the facts which they record. Thus, the solar and lunar dynasties spoken of in the epic poems, the *Rāmāyana* and *Mahābhārata*, and in the *Purānas*, as well as other dynasties, like that of Pradyota, S'isunāga, and others mentioned in the *Purānas*, are, for the present, at least, beyond the reach of history, in the sense in which we use this word. The first reliable date to be met with in ancient Hindu history is that of *Chandragupta*; for he is the king whom the Greek historians call *Sandrocottus*; and as he was the ally of Seleucus, we may safely conclude that he reigned about 300 B.C. He belonged to the Maurya dynasty, which contains another distinguished name, that of the king *Asōka*, who plays a prominent part in Buddhist history, and probably reigned from 263 to 226 B.C.; but since the history of this and other dynasties which reigned in different parts of India up to the time of the Mohammedan conquest, concerns more the special student of Hindu antiquity and Indian history than the general reader, we must content ourselves here with referring those who take an interest in it to the admirable work of Professor Christian Lassen, the *Indische Alterthumskunde*, where they will not only find the richest material collected in any one book hitherto devoted to this subject, but also learn to appreciate the difficulties which beset the questions of ancient Hindu history and chronology.

From the Mohammedan Conquest (1001) to the close of Viscount Canning's administration (1862).—*House of Ghizni* (1001–1167). The Sultān Mahmūd, sovereign of the small state of Ghizni (q.v.), was the first conqueror who permanently established the Mohammedan power in India. In 1186, the House of Ghizni became extinct, and the Hindu princes fell one by one before a succession of Mohammedan dynasties, whose names and dates are as follow: *Slave Kings of Delhi* (1206–1288).—One of these sovereigns, Altmish, who ascended the throne in 1211, added the greater part of Hindustan Proper to his dominions, and in his reign the Mongol Genghis Khan devastated the north-eastern parts of India. In Balin's reign (about 1284) the Mongols made a second irruption into Hindustan, but were totally defeated by the monarch's eldest son, the heroic Mohammed, who fell in the action. The *Khiljis* and *House of Toghlaq* (1288–1412).—In 1290, the Mongols made their third and last great irruption into Hindustan, but were almost annihilated by Zafir Khan, whose name became so proverbial among the Mongols, that when their horses started, they would ask them if they saw the ghost of Zafir Khan. In 1397, during the reign of the last of the Toghlaq kings, the Tartar Timur, or Tamerlane, sacked Delhi, and proclaimed himself emperor of India. The *Syuds* (1412–1450). The *House of Lodi* (1450–1526). To the kings of this dynasty succeeded the *Great Moguls* or *House of Timur* (1526–1707). Baber, who had for twenty-two years been sovereign of Cabul, invaded I. for the fifth time towards the end of the year 1525 (see BABER), and after doing battle with Sultān Ibrahim on the plain of Paniput, April 1526, entered Delhi in triumph, and established himself as emperor of the Mohammedan dominions in I., in right of his ancestor Timur. He died in 1530, and was succeeded by his son Humayun. The celebrated Akbar (q.v.), son of Humayun, became emperor in 1556, and reigned for nearly twenty-five years. His son ascended the throne in 1605, and his grandson, Shah Jehan, in 1627. In 1658, Shah Jehan

was imprisoned by his son, the famous Aurungzebe (q. v.), who usurped the imperial power. This remarkable man raised the Mogul empire to the highest pitch of greatness and splendour, and was the ablest and most powerful, as well as the most ambitious and bigoted, of his race. The death of Aurungzebe took place in 1707, and the decay of the empire, which had begun a few years before then, proceeded rapidly. 'A succession of nominal sovereigns, sunk in indolence and debauchery, sauntered away life in secluded palaces.' Viceroy of the Great Mogul formed their provinces into independent states; whilst Hindu and Mohammedan adventurers carved out kingdoms with the sword. The dismemberment of the Mogul empire opened a wide field for ambition and enterprise to the nations of Europe. The Venetians, the Genoese, the Portuguese, and the Dutch had by turns traded with I.; and in 1602, the English appeared on the scene. See EAST INDIA COMPANY.

In 1653, Madras was raised into a presidency, and in 1668, the island of Bombay—which was the dowry of Charles II.'s queen, the Infanta Catherine of Portugal—was transferred by the crown to the Company. The invasion of the Persian, Nadir Shah, in 1738, who sacked Delhi, slaughtered its inhabitants, and carried away the Peacock Throne, and vast treasure, hastened the fall of the Mogul empire.

1745—1761.—Great jealousy existed between the English and French, who had also established themselves in India. On the declaration of war between England and France, hostilities commenced in the Madras presidency, nor were they terminated by the peace of Aix-la-Chapelle, in 1748. The struggle in the Carnatic was continued with ardour, under pretext of supporting the claims of rival native princes to sovereignty. Clive (q. v.), the first and most famous name on that great muster-roll of British soldiers and statesmen who have thrown such lustre on the British occupation of I., laid the foundation of his country's supremacy in the East. His memorable defence of Arcot in 1751, and his subsequent victories, broke the spell of French invincibility. The next memorable event was the siege and capture of Calcutta, on the 20th June 1756, by Suraja Dowlah, grandson of Ali Verdi Khan, and governor or subahdar of Bengal. The prisoners, 146 in number, were confined in the small garrison prison or Black Hole, of whom only 23 survived till the morning. Clive quickly took command of an expedition fitted out at Madras, recovered Calcutta (1757), and, assisted by Admiral Watson, prosecuted the war with his usual vigour, till after a hollow peace and a renewal of hostilities, Suraja Dowlah was completely defeated by Clive in the memorable battle of Plassey, 23d June 1757. Meer Jaffir, Suraja Dowlah's commander-in-chief, was placed on the musnud by the English, who from this time ruled Bengal as well as Bahar and Orissa.

Political Progress of East India Company (1764—1773).—After the battle of Buxar, fought in 1764 with Sujah Dowlah, the usurping vizier of Oude, the Mogul emperor, Shah Alum, who had previously been in the power of the defeated Sujah Dowlah, claimed the protection of the British. He confirmed the Company in their possessions, and granted them the collectorate or perpetual *devannee* of Bengal, Bahar, and Orissa, on condition of receiving the sum of £260,000 per annum. During the subsequent financial difficulties of the Company, they repudiated this and other conditions which they had guaranteed to Shah Alum; and the cost to the Company of maintaining their authority and standing army prevented them from undertaking public

works and developing the resources of the country. The Regulating Act was passed in 1773, and a governor-general was appointed. In 1765, Clive purged the Indian government of oppression, extortion, and corruption, and from that, his last visit, dates the purity of the administration of our eastern empire.

Administration of Warren Hastings (1773—1785).—Warren Hastings was the first governor-general of India. A new power, the Supreme Court of Judicature, appointed by the Regulating Act, came into operation during his administration. This council arrogated to itself authority exceedingly embarrassing to the governor-general, to whom it was very hostile. Hastings used very unscrupulous, and at times very unjustifiable means to replenish the East India Company's exchequer, but, by his energy and talent, he averted dangers that threatened to annihilate the British supremacy in India. The powerful Mussulman sovereigns, Hyder Ali and the Nizam of the Deccan, assisted by French officers, combined with the Mahrattas against the English; Sir Eyre Coote broke up the confederacy, and defeated Hyder Ali in 1781. In 1782, the Supreme Court of Judicature was deprived of its independent powers, and the policy of Hastings was successful both in the council and in the field. In 1784, Mr Pitt instituted the Board of Control.

Marquis Cornwallis (1786—1793).—Lord Cornwallis, who succeeded Warren Hastings, was both governor-general and commander-in-chief. His administrative measures were important, and consisted most notably in fixing the land-rent throughout Bengal on that system of land tenure known as Zemindari, and reforming the judicial system. In 1790, Lord Cornwallis, with the Nizam, the Mahrattas, and the Rajah of Coorg for allies, made war on Tippoo, Sultan of Mysore, who had invaded Travancore, then under British protection. Terms were dictated to Tippoo at his capital, Seringapatam, and he was compelled to cede half his dominions to the Company.—The Marquis Cornwallis was succeeded by Sir John Shore (1793—1798), whose rule was in no respect memorable.

Marquis Wellesley (1798—1805).—The British empire in the East, like that of Napoleon I. in Europe, could only be maintained by constant fighting; it was the price paid for empire, and to stand still was to retrograde. Tippoo Shah broke his faith by intriguing against the English both with the French and with native princes; his bad faith cost him his crown and his life. In May 1799, Seringapatam was captured, and Tippoo slain. The Hindu dynasty, displaced by Hyder Ali, was restored, and the administration carried on most successfully for the youthful rajah by Colonel Wellesley (afterwards Duke of Wellington). In the famous battle of Assaye, in 1803, he defeated the Mahrattas under Scindia; and the victories of Lord Lake in Northern I. extended very considerably the dominions of the Company. The policy of the Marquis Wellesley was, however, too aggressive to suit the views of the East India Company, and he was superseded by Lord Cornwallis, who only returned to I. to die. Lord Minto succeeded from 1806 to 1813.

Nothing of much importance occurred until the Marquis of Hastings became governor-general (1813—1823). He waged war against the Pindaris, who were entirely suppressed. He had previously defeated the Gurkhas; and before the close of his brilliant administration, he made the British power supreme in India. The civil administration of the Marquis of Hastings was directed to the amelioration of the moral condition of the people of India.

The next administrations were those of Earl Amherst and Lord William Bentinck. The first was signalled by the Burmese war, the second by the suppression of *sutti* and the Thugs.

Earl of Auckland (1835–1842).—This governor-general is known chiefly by his unjustifiable and disastrous Afghan policy, ending in the horrible massacre of British troops in the Khyber Pass. See AFGHANISTAN.

Earl of Ellenborough (1842–1844).—The 'army of retribution' proceeded to Cabul soon after Lord Ellenborough took the reins of government. Cabul was sacked, several public buildings razed to the ground, after which the country was evacuated. The conquest of Sind by Sir Charles Napier, followed by its annexation, also belongs to this administration.

Sir Henry Hardinge (1844–1848).—Lord Ellenborough having been recalled by the East India directors, from alarm at his martial tendencies, Sir Henry Hardinge was sent to take his place. The attention of the new governor-general was, however, soon diverted from works of peace, to do battle with the bravest people of India. Ever since the death of our ally, Runjeet Singh, in 1839, the Punjab had been in a state of disorganisation. The Sikhs, uneasy at our conquests in Sind and Gwalior, and remembering our discomfiture at Cabul and the Khyber, resolved to anticipate the attack they considered imminent. The first Sikh war commenced on the part of the Punjabees by the passage of the Sutlej, and was followed by the terrible battles of Moodkee, Ferozeshah, Aliwal, and Sobraon, in which, after very hard fighting, the Sikhs were defeated with great slaughter. The war resulted in a British resident and British troops being stationed at Lahore, although the boy-prince, Dhuleep Singh, was acknowledged as Maharajah. The Cis-Sutlej states, the Jullundur Doab, and the alpine region between the Beas and the Sutlej, were annexed.

Marquis of Dalhousie (1848–1855).—The administration of the Marquis of Dalhousie 'consummated a policy and closed a period,' and the century of the Company's empire has few so rich in events, and rife with consequences. Beneath his rule, the territory of 'the British merchants trading to the East received its latest extension; and at his departure the sun of their power verged to a stormy setting.' It is memorable for the commencement of superb public works, cheap uniform postage, railways, telegraphs, improvements in government, and social progress generally; a second Sikh war (ending in the crowning victory of Gujerat, 21st February 1849), a second Burman war (finished in 1852); and the annexation of four kingdoms, the Punjab, Pegu, Nagpûr, and Oude.

Viscount Canning (1856–1862).—When Lord Canning took the reins of government, everything promised a reign of peace and prosperity; but it was only the treacherous calm—the *burra choop*, or great silence—that precedes the tempest. With the early days of 1857 came the first mutterings of the storm that was to sweep over so large a portion of British India. At the commencement of the year, chupatties (cakes of flour and water) were circulated mysteriously through the North-west Provinces; a proclamation, a kind of politico-religious encyclical letter from the Shah in Shah, the head of the faithful in the East, was found in the tent of the Shahzada at Mohumrah, appealing to the faithful to exterminate the Feringhees; treasonable placards appeared at Delhi, and other suspicious occurrences gave warning of Mohammedan disaffection or conspiracy. The Enfield rifle and its greased cartridge was at this time put into the hands of the sepoys without explanation or precaution; and General

Anson, the commander-in-chief, snubbed caste, and was against all concession to the 'bestly prejudices' of the natives. The first actual demonstrations of a mutinous spirit broke out at Dumdum (January), Berhampore (26th February), and Barrackpore (29th March), where the native soldiers refused to touch the greased cartridges; but the grand centre of the outbreak was Meerut (32 miles from Delhi). Here were stationed the 6th Dragoon Guards, the first battalion of Her Majesty's 60th Rifles, and other European troops, amounting to about 1800 men, besides sappers and miners, and about 2900 native soldiers. On the 23d April, the skirmishers of the 3d Cavalry, on parade, refused to touch the new cartridges, although permission was given to break off the end with the fingers. The 85 mutineers were tried, found guilty, and sentenced to various terms of imprisonment. The parade when the troopers were ironed was held on the 9th May, but the punishment only maddened and infuriated the native troops, for within six-and-thirty hours, Meerut was a scene of bloodshed and desolation. On the evening of the next day, the native troops rose, liberated their comrades and the felons of the jail, shot down their officers, and the doomed station was given up to conflagration and massacre. The military authorities, taken by surprise, were paralysed. There was no leader for the 1800 European soldiers, and until too late, no attempt was made to put down the revolt, or to stop the march of the mutineers to Delhi. The outbreak at Meerut was the crisis of the rebellion. Its prompt suppression would probably have crushed the mutiny, as its mismanagement involved the fall of Delhi, the sacrifice of thousands of lives, and the temporary triumph of the seditious. The next day, the 11th of May, the Meerut mutineers reached Delhi. There were no European troops to oppose them, and the city fell into their hands, but was retaken by General Archdale Wilson the following September. At the end of June, General Wheeler was forced to surrender to Nana Sahib at Cawnpore, and, in spite of the promise of safe-conduct to Allahabad, all the men were immediately massacred. The women were butchered on the 15th of July by order of the Nana, when he heard of Havelock's march from Allahabad, which began on the 7th of the same month. Meanwhile the mutiny had spread all through Oude. The Europeans in the Residency at Lucknow were besieged on the 30th of June by an enormous horde of infuriated mutineers. Five days afterwards, the commandant, Sir Henry Lawrence, died of his wounds, and his place was taken by Brigadier Inglis, who bravely held out till he was relieved on the 25th of September by the heroic Havelock. The relieving force, however, was itself too small to raise the siege; myriads of mutineers swarmed around the Residency, and Havelock's troops, with those he had come to rescue, were in their turn besieged. The final relief was achieved by Sir Colin Campbell in person. He marched from Cawnpore on the 9th November, with an army of 4200 men, reached the Alum Bagh (a palace three miles from Lucknow) on the 12th, and on the morning of the 14th advanced towards the Residency. After storming the various fortified positions of the enemy, he reached the beleaguered garrison on the following day. The evacuation of the Residency followed, and was so cleverly accomplished, that the sick and wounded, the women and children, together with money and treasure, were brought away through 'a narrow, tortuous lane—the only line of retreat open—in the face of 50,000 enemies, without molestation.' Lucknow itself was in the meantime allowed to remain in possession of the rebels, but on the 3d of March 1858, Sir Colin Campbell commenced

to besiege it, and on the 17th the city was again in complete possession of the British. Central I. was reduced by Generals Rose, Roberts, and Whitlock. Jhansi was re-occupied by the 4th of April. The surrender of Calpi and Gwalior followed; and the rebels suffered further by the death of the Rane of Jhansi, the best and bravest of their leaders. Bareilly, in Rohilcund, was taken in May; and by June 1858, no city or fortress of any importance remained in the hands of the mutineers. Oude was entirely reduced by the beginning of the year 1859. The able rebel leader, Tantia Toppe, was at last taken, tried by court-martial, and hanged. During the mutiny, valuable assistance and protection were received from many native chiefs. Rewards and honours were in consequence bestowed upon Scindia, the Maharajah of Gwalior; Holkar, Maharajah of Indore; on the Nizam of Hyderabad, and many others. Throughout the mutiny, natives of I., princes, servants, and sepoys, were found on the side of the British. The 13th, 48th, and 71st regiments of native infantry at Lucknow remained true to their salt, in spite of almost irresistible temptation; while in the Punjab a band of faithful sepoys were formed into an irregular corps, called the Faithful Regiment.

Many causes have been assigned for the mutiny of 1857—1858. The circulation of chupattis and lotas or brass vessels of Ganges water; the proclamation of the Shah in Shah, already alluded to, the proclamation of the king of Delhi, and the placards posted in that city; the uniformity of the plan adopted by the rebel sepoys, and the facts elicited at the trial of the king of Delhi, all lead to the belief of a Mohammedan conspiracy. The Bengal army in its unsound state was a ready instrument in the hands of political schemers, and such an experiment as that of the greased cartridges was only wanted to fire the train of craftily laid treason. The trial of the king of Delhi resulted in his conviction as 'a false traitor to the British government, and an accessory to the massacre in the palace.' It was the fate of the last representative of the East India Company to sentence the last Great Mogul and heir of the House of Timūr 'to be transported across the seas as a felon.' He was transported accordingly, accompanied by his queen and son, to Tongu, in Pegu, where he died in 1862.

The end of the great Company, and the proclamation, in I., of the sovereignty of Queen Victoria, on the 1st November 1858, have been already alluded to. As a result of this, the financial condition of the country is completely changed. Natives of the higher class are nominated to seats in council at each presidency, and a native magistracy has been established; in short, a new maxim has obtained in the administration of the country—viz., that 'India should be ruled for the Indians, and that no imperial necessity can be stronger than imperial obligations.' For further information upon I., the following works may be consulted with advantage: *The History of British India*, by James Mill, Esq., with notes and continuation by Horace Hayman Wilson, M.A., F.R.S. (Lond. 1858); *History of the British Empire in India*, by Edward Thornton, Esq. (Lond. 1861); *The Indian Empire*, by R. Montgomery Martin, Esq.; *The Progress and Present State of British India*, by Montgomery Martin (Lond. 1862); *The History of the Indian Revolt*, published by the Messrs Chambers in 1859; *The Punjab and Delhi in 1857*, by the Rev. J. Cane-Brown, M.A. (Lond. 1861); *An Account of the Mutinies in Oude and of the Siege of the Lucknow Residency*, &c., by Martin Richard Gubbins (Lond. 1858); *The Marquis of Dalhousie's Administration*

of British India, by Edwin Arnold, M.A. (Lond. 1862).

INDIA, FRENCH, comprises, at the present time, the following settlements:

Name.	Locality.	Area in Sq. Miles.	Population.
Chandernagore, Karikal, Pondicherry, Yanon, Mahé, . . .	On the Hooghly River, Coromandel coast, Coromandel coast, Orissa coast, Malabar coast,	189	219,878

INDIA, PORTUGUESE, is now confined to the territories indicated in the annexed table:

Name.	Locality.	Area in Sq. Miles.	Population.
Goa, &c., Damaun, Diu, . .	Western coast, Concan coast, South coast of Kattywar, }	1441 94	333,788 44,808

INDIAN ARCHITECTURE. The styles of art which have existed at different times in India, as in other countries, vary with the religion prevalent at the time. The earliest faith of which we have any architectural monuments is that of Buddhism (q. v.). About 250 B.C., Asoka, a powerful monarch, became a strenuous supporter and propagator of Buddhism, and to his zeal we owe the oldest architectural remains of India. From his time to the present day, the sequence is unbroken, and the whole history of Buddhist architecture can be most distinctly traced either in India or in Ceylon, Java, and Tibet. The whole subject is as yet, however, but imperfectly illustrated, the best account of the Indian styles being that contained in Fergusson's *Handbook of Architecture*, and his other works.

The Buddhist remains are of two kinds: 1. Commemorative monuments, called Topes or Stupas (q. v.); the earliest stupas are single pillars, bearing evident traces of a western origin, and thus affording a clue to the history of Indian art. 2. Temples (chaityas) and monasteries (viharas). Of the chaityas and viharas, no built examples remain; they are all excavated out of the solid rock. There are no less than 40 or 50 groups of these monuments, each group comprising from 10 to 100 distinct excavations. A few of these belong to other religions, but the great majority are Buddhist, and nearly the whole are monasteries, not over 20 to 30 being temples. The oldest are at Bahar and Cuttack in Bengal (200 B.C.), but they are few in number, nine-tenths of the caves being in the Bombay presidency. This probably arises from the nature of the material in which they are cut, the eastern caves being in a hard granite, and those of the west being in a very uniform and comparatively soft amygdaloid. The latter date from the beginning to about the 10th c. of the Christian era. The cave-temple at Karli is one of the largest, and is of a good style. See section in art. BUDDHA. In plan and general arrangements, it strongly, though no doubt accidentally, resembles a Christian basilica, with nave, aisles, and vaulted roof, and an apse with the shrine in the place of the altar. There is also an outer hall or atrium, and a gallery like the rood-loft. On the roof, are numerous wooden ribs, attached to the vault; these and other portions indicate that the building from which the cave was copied was wooden, which may account for the absence of earlier built examples. This cave is 126 feet long, 45 feet 7 inches wide, and 40 to 45 feet high.

The vihara or monastery caves are very numerous, as was required by the enormous number of Buddhist priests. The oldest and simplest examples are in Bengal, but the finest are in Western India. They

consist of a central hall, with cells round three sides, and a verandah on the fourth side, next the open air; opposite the central entrance, there is usually a large cell or shrine, containing an image of Buddha. There are fine caves at Ajunta, Baugh, &c., many of them beautifully carved and painted. The pillars are most elaborately ornamented, and have the bracket capitals which distinguish all Indian architecture. From the absence of any built example, there has been great difficulty in forming a correct idea of the exterior of the buildings from which these caves were copied. By following the style into other countries where the religion has prevailed at different times, Mr Fergusson has been able to trace it up to the present day, and to establish by analogy the probable external appearance of the early Buddhist architecture.

The temple of Brambanam, in Java, seems to shew the original form of built cells. They are quite detached, and arranged in a square round a central temple—evidently suggesting the arrangement in the caves at Ajunta. Some rock-cut temples which have an exterior (at Mahavellipore), shew the cells attached to the main building. In Burmah, where the monastic system still prevails, the monasteries, which are of wood, are built in stages in a pyramidal form. The temple of Borobuddor (q. v.), in Java, has a similar arrangement, consisting of a large number of cells or niches in tiers; but in place of being occupied by priests, they are filled with cross-legged Buddhas, a conversion quite common in later Hindu architecture. In many styles of architecture, the niches or other subordinate parts are frequently copies on a small scale of the façade of the building itself. Thus, for instance, the windows with pillars and pediments in classic architecture, are a repetition of a temple end. The niches inside the caves, containing statues of Buddhist saints, are in a similar manner imitations of the main façade. In the same way externally, the Burmese pagodas and Hindu temples are ornamented all over with models of the buildings themselves.

Mr Fergusson has thus traced, in fuller detail than our space will allow, the transformations that have taken place in Buddhist architecture, which, whatever its artistic qualities may be, has at least the very interesting feature of being a style which has existed from 200 years before Christ up to the present day.

The other styles of Indian architecture are illustrated by the temples of the Jainas and those of the Hindus. The former seems to have been an imitation of the Buddhist temples without the cells for the priests. Their religious structures consist of a sanctuary surmounted by a spire; in front of this, a pillared vestibule, with a dome, and round the whole an arcaded enclosure, with cells all round, containing images. The cells are also surmounted with spires, and the arcades with domes are often repeated to a considerable number within one enclosure. The most striking feature of this style is the dome, which is constructed by horizontal jointing, not with regular arches. The domes, with the pillars, bracket capitals, &c., are all elaborately decorated.

Hindu architecture is divided into two styles—northern and southern. All the finest examples are southern, and are found south of Madras. The temples consist of the temple or vimana, in front of which is the pillared porch or mantopa, the gate pyramids or gopuras, forming the entrances to the enclosure, and the pillared halls or choultries. In the south, the temple is always pyramidal, and in many stories; in the north, the outline is curved, and in one story. The finest example is the pagoda of

Tanjore. It is 82 feet square at base, and 14 stories, or about 200 feet, in height.

The gopuras are similar to the pagodas, but oblong in place of square.

Gopura, or Gate :

Leading into the enclosure of the temple at Seringham.

The pillared halls are very wonderful structures, containing sometimes as many as 1000 columns, and as these are all elaborately carved, and all different, the labour of their construction must have been enormous. They are used for many purposes connected with Hinduism, their most important use being as nuptial halls, in which the mystic union of the divinities is celebrated. The general arrangement of these halls sometimes produces a good effect; but from their flat roofs, they cannot equal the beauty of the domed arcades of the Jainas. These buildings are of various dates, from the commencement of the Christian era to the last century, and it is remarkable that the oldest examples are the finest—the style growing gradually more and more debased, till, at the present day, it has become, like the religion, a mass of absurdity and obscenity. The celebrated rock-cut temple, called the Kylas, at Ellora (q. v.), belongs to this style.

When the Mohammedans conquered India, they imitated the style of the country in their mosques, and afterwards the Hindus borrowed from them, and thus a mixed style was created, which, in the palaces, tombs, &c., of the native princes, produces picturesque effects. The Mohammedans also covered the country with specimens of their Moorish style, which will be treated under SARACENIC ARCHITECTURE.

Some of the finest buildings of India are the ghauts or landing-places, with their broad flights of steps; the reservoirs or bowlees, and dams, all ornamented with temples, kiosks, stairs, &c.; but our space will not permit us further to describe them. There is one very remarkable fact connected with Indian architecture, viz., that although the form of the arch is constantly used—in domes, arcades, &c., especially in the style borrowed from the Moslems—yet the radiating arch construction is never adopted. The architraves are supported on bracketed capitals, which project, bracket over bracket, till the space is spanned by one lintel. This leads to many beautiful results in the early styles, and in the later mixed style, the bracketed cornices are amongst its finest features.

INDIAN ARMY. See EAST INDIA ARMY.

INDIAN CORN. See MAIZE.

INDIAN FIG. See PRICKLY PEAR.

INDIAN FIRE, a bright white signal-light, produced by burning a mixture of 7 parts of sulphur, 2 of Realgar (q. v.), and 24 of nitre.

INDIAN GRASS MATTING, or INDIAN MATTING, a kind of matting imported in large quantities from Calcutta, is made from a species of PAPYRUS (q. v.), *P. Pangorei*, called *Madoorkati* in Bengal, and there very abundant. The stalks of the plant, when green, are split into three or four pieces, which, in drying, contract so that the edges come almost into contact; and when woven into matting, they shew nearly the same beautiful shining surface on both sides.

INDIAN INK. The cakes of this substance, which is a mechanical mixture, and not, like the true inks, a chemical compound, are composed of lampblack and size or animal glue, with a little perfume. The lampblack must be remarkably fine, and is said to be made in China by collecting the smoke of the oil of sesame. A little camphor (about 2 per cent.) is also found in the ink made in China, and is thought to improve it. This substance is used in that country with a brush both for writing and for painting upon paper of native manufacture, while, in this country, it is extensively employed for designs in black and white, and all intermediate shades of colour. Much curious information on this pigment may be found in Merimée's treatise, *De la Peinture à l'Huile*.

INDIAN OCEAN, one of the five grand divisions of the universal ocean, is bounded on the S. by a line drawn from the Cape of Good Hope to the most southerly extremity of Tasmania or Van Diemen's Land. Its other limits, reckoning from the last-mentioned point, are Van Diemen's Land, Australia, the Indian Archipelago, Farther India, Hindustan, Persia, Arabia, and Africa. Gradually narrowing from south to north, the I. O. forks at Cape Comorin into the Bay of Bengal on the east, and the Arabian Sea on the west, the latter again branching off into two arms, the Persian Gulf and the Red Sea, which reach respectively the mouth of the Euphrates and the neighbourhood of the Mediterranean. These details exclude the waters of the Indian Archipelago, as belonging rather to the Pacific Ocean. As above defined, the I. O. stretches in lat. from 43° 35' S. to 30° N., and in E. long. from 18° 29' to 146° 12'. It contains thousands of islands, or rather tens of thousands. Of these, Madagascar is the largest, and at about the same distance from it to the east as the continent of Africa is to the west, lie Bourbon or Reunion towards the south, and Mauritius towards the north. Next in size to Madagascar, and, in fact, the only other island of any considerable magnitude, is Ceylon. As a channel of commerce, this ocean would appear to have been the first to find a place in history, inasmuch as the earliest voyage on record beyond the land-locked Mediterranean—that of Solomon's navy—did certainly extend further than the Straits of Bab-el-Mandeb. In this respect, it virtually maintained its superiority during fully 2000 years, being habitually traversed, in the line of the crow's flight, between Arabia and Hindustan, while coasting voyages alone were known in the Atlantic. This comparatively bold navigation was suggested and facilitated by the periodical monsoons of the northern part of the I. O., blowing, as they do, alternately from the south-west and the north-east.

INDIAN SHOT (*Canna Indica*), a plant common in almost all tropical countries; a herbaceous perennial, with a creeping root-stock (*rhizome*), and a simple stem, formed by the cohering bases of the large, tough, ovate-oblong leaves. It belongs to the natural order *Marantaceae*. It derives the name I. S. from the seed, which is hard, round, and about the size of a very small pea, and is sometimes used as shot. The seed yields a beautiful red colour. The root-stocks are very large, spongy, and jointed, and are used in Brazil for emollient poultices in tumours and abscesses. The root-stocks of some of the other species of *Canna* are more valuable, yielding the starch called TOUS-LES-MOIS (q. v.).

INDIAN TERRITORIES, a phrase of vague meaning, is peculiar to the geography of America. Originally and naturally, it indicated such portion of each country as had not yet been colonised, a portion which, of course, was constantly diminishing. In this sense, therefore, the words necessarily varied in extent of application from year to year. In 1821, however, the I. T. of British America were defined by statute as comprising only the unsettled wildernesses beyond the Hudson's Bay Company's chartered domain, which was itself generally held to be identical with the basins of all the feeders of Hudson's Strait and Hudson's Bay. Due west, this vast region bordered on Russian America, while from the parallel of 54° 40' southward to that of 42°, it touched the Pacific Ocean. Subsequently to 1821, this maritime section was partly ceded to the United States, and partly erected into the colony of British Columbia, so that the I. T. of the present day nowhere reach the sea excepting on the ice-bound shores of the north. Within this limited range, too, they have practically lost their statutory character, being virtually released (see HUDSON'S BAY COMPANY) from the restrictive system of trading-licences. Hitherto, perhaps, the change has been merely nominal, for, independently of the influences, moral and physical, of long possession, the Hudson's Bay Company finds, in distance and seclusion, a guarantee stronger than any parliamentary title. If competition is likely to be powerless for years to come, colonisation is sure to be so for ages under the combined prohibitions of soil and climate. The I. T. stretch in N. lat. from about 52½° to about 70°, and in W. long. from about 103° to the international boundary between Russia and England of 141°. They consist chiefly of the valleys of the Back, the Coppermine, and the Mackenzie. Beyond all the analogies of civilised communities, the native population is incredibly sparse and scanty, certainly not exceeding, at an extravagant estimate, 10,000 in number, exclusively engaged in hunting and fishing; while less than 500 strangers of every description are scattered abroad in hovel-like forts, hundreds of miles distant from each other. The I. T. form part of the diocese of Rupert's Land, established in 1849; but it is only since 1858 that they have actually become the scene of missionary operations.

INDIAN TERRITORY, a country reserved by the government of the United States for the Indian tribes removed west of the Mississippi, and those living there. It lies between 33° 30' and 37° N. lat., and 94° 20' and 103° W. long., being 370 miles long by 220 wide, with an area of 74,127 square miles. It is bounded on the N. by Kansas, E. by Arkansas, S. and W. by Texas, from which it is separated on the south by the Red River. It is a beautiful country, with vast fertile plains, watered by innumerable streams, including the Red River, the Arkansas, and their branches. The

climate is genial, producing cotton, tobacco, maize, wheat, and fruits. Its population of 120,000 consists of Cherokees, Creeks, Seminoles, Choctaws, Chickasaws, and remnants of smaller tribes. Provided with schools, missionaries, and annual payments from the United States government for the lands they have abandoned, they are well advanced in civilisation. The young women are educated in female seminaries, and many of the Indians own negro slaves, and cultivate large plantations.

INDIAN YELLOW, or **PURREE**, is a colouring matter highly esteemed by artists. It is exported from the East Indies in masses of three or four ounces in weight, which are of a dark-brown colour externally, but of a bright orange yellow in the interior. Nothing certain is known regarding its origin, but it is generally believed to be a urinary sediment of the camel or buffalo, after the animal has fed on decayed and yellow mango leaves. Its odour is peculiar, and resembles that of castoreum. This substance consists chiefly of the magnesian salts of an acid termed *purreeic* or *euxanthic acid*. It is almost insoluble in cold water or alcohol, but is soluble in hot alcohol and in ether; it also dissolves freely in boiling dilute hydrochloric acid, from which stellate groups of acicular crystals of euxanthic acid ($\text{HO}, \text{C}_{12}\text{H}_{17}\text{O}_{21}$) are deposited on cooling. Alkaline solutions dissolve this acid, and form a yellow liquid. A solution of euxanthate of potash when mixed with the solutions of the salts of the earths, gives brilliant yellow, sparingly soluble precipitates, and, with acetate of lead, it forms a yellow insoluble lake.

By dry distillation, this acid yields a yellow, crystalline sublimate of *purrenone* or *euxanthone* ($\text{C}_{12}\text{H}_{12}\text{O}_{12}$), water and carbonic acid being evolved; and, with nitric acid, it yields several nitrogenous bodies of considerable interest, in a purely chemical point of view, but of no practical importance.

INDIANA, one of the United States of America, organised in 1816, with a governor and legislature, extends from $37^{\circ} 47'$ to $41^{\circ} 46'$ N. lat., and from $84^{\circ} 49'$ to $88^{\circ} 2'$ W. long., having a length of 276 miles, a breadth of 140 miles, and an area of 33,809 square miles, or 21,637,760 acres. It is bounded on the N. by Michigan state and lake, E. by Ohio, S. by Kentucky, from which it is separated by the Ohio river, and W. by Illinois. The state is divided into 91 counties. The capital is Indianapolis, near the centre, and its chief towns are Evansville, New Albany, Madison, Vincennes, Terre Haute, Lafayette, Fort Wayne, and its only lake-port, Michigan City. The population in 1800 was 4875; in 1810, 24,520; in 1820, 147,178; in 1830, 343,031; in 1840, 685,866; in 1850, 988,416; and at the census of 1860, 1,350,941, of which nearly half are immigrants from other states, and from Germany and Ireland. The state is level, with sluggish streams and great prairies. It is chiefly drained by the Wabash river and its branches. There are 7700 square miles of coal, portions of which, on the Ohio, are canal coal of excellent quality. The soil is of wonderful fertility, and the climate is like that of the south of France, with colder winters, and the hills on the Ohio are covered with fine vineyards. The staple productions are wheat, maize, cattle, swine, tobacco, fruits, wine, &c. There are over 2000 miles of railway, and a canal of 467 miles, uniting the Ohio river with Lake Erie. In 1850, there were 2035 churches, 11 colleges, 4822 public schools, and 107 periodicals. Vincennes, on the Wabash, was settled by the French in 1702. In the early part of this century, the settlements were disturbed by Indian hostilities; the Indians

were defeated in 1811 by General Harrison, and the territory was peopled with great rapidity. The sale of lands from 1830 to 1840 was over 9,000,000 acres.

INDIANAPOLIS, a city and capital of Indiana, United States of America, is built on the west fork of White river, near the centre of the state, 109 miles north-west of Cincinnati. It is a regularly built and beautiful city, with a handsome state-house, court-house, jail, and state asylums for the blind, deaf and dumb, and insane. It has a university, 2 female colleges, 30 churches, 8 banks, 9 printing-offices, 11 hotels, and woollen factories, iron-foundries, planing-mills, and flour-mills, with abundant water-power. It is the terminus of eight radiating railways. In 1840, the population was 2692; in 1860, 30,000.

INDIANS, **AMERICAN**, the collective name now generally given to the various nations and tribes inhabiting North and South America, at the time of their discovery by the Spaniards, and to such of their descendants as survive at the present day. The name of Indians was first given to the natives of America from the mistaken notion of the early voyagers, Columbus himself included, that the newly found continent was in reality a part of India. This was soon shewn to be an error; but the name of Indians, thus wrongly applied to the inhabitants, continued to be used in every narrative of voyage and discovery, and has descended even to our own times, only that we now qualify it in some measure by speaking of them as *American Indians*.

In the classification of Blumenbach, the American Indians are treated as a distinct variety of the human race; but in the threefold division of mankind laid down by Dr Latham, they are ranked among the Mongolids. Other ethnologists also regard them as a branch of the great Mongolian family, which, at a remote period of the world's history, found its way from Asia to the American continent, and there remained for thousands of years separate from the rest of mankind, passing meanwhile through various alternations of barbarism and civilisation. Morton, however, the distinguished American ethnologist, and his disciples Nott and Gliddon, claim for them a distinct origin, one as indigenous to the continent itself as its fauna and flora. 'The American race,' says Dr Morton, 'differs essentially from all others, not excepting the Mongolian; nor do the feeble analogies of language, and the more obvious ones of civil and religious institutions and arts, denote anything beyond casual or colonial communication with the Asiatic nations; and even these analogies may perhaps be accounted for, as Humboldt has suggested, in the mere coincidence arising from similar wants and impulses in nations inhabiting similar latitudes.' Even Prichard, whose views with respect to the unity of the human race differ essentially from those of Morton and his school of ethnology, acknowledges that, 'on comparing the American tribes together, we find reasons to believe that they must have subsisted as a separate department of nations from the earliest ages of the world. Hence, in attempting to trace relations between them and the rest of mankind, we cannot expect to discover proofs of their derivation from any particular tribe or nation in the old continent. The era of their existence as a distinct and insulated race must probably be dated as far back as that time which separated into nations the inhabitants of the Old World, and gave to each branch of the human family its primitive language and individuality.' Thus, on all hands we find an admission made of the most remote antiquity with respect to the origin of the various

American tribes. It is also admitted that between these various tribes, from the Arctic Sea to Cape Horn, there is greater uniformity of physical structure and personal characteristics than is seen in any other quarter of the globe. There are varieties, it is true, and those sometimes of a very striking kind. The 'Red Men,' as they are called, of the United States and Canada, differ in many respects from the Guaranis of Paraguay, and both from the wild tribes of California, but all exhibit the clearest evidence of belonging to the same great branch of the human family. Upon this point, the testimony of a writer like Humboldt is very important. 'The Indians of New Spain,' says Humboldt, 'bear a general resemblance to those who inhabit Canada, Florida, Peru, and Brazil. . . . Over a million and a half of square leagues, from Cape Horn to the river St Lawrence and Behring's Strait, we are struck at the first glance with the general resemblance in the features. We think we perceive them all to be descended from the same stock, notwithstanding the prodigious diversity of their languages. In the portrait drawn by Volney of the Canadian Indians we recognise the tribes scattered over the savannahs of the Apure and the Carony. The same style of features exists in both Americas.'

Generally, the physical characteristics of the American Indians are as follows: a square head, with a low but broad forehead, the back of the head flattened, full face, and powerful jaws; cheek-bones prominent; lips full; eyes dark, and deeply set; the hair long, not absolutely straight, but wavy, something like a horse's mane, and like that, of a glossy hue; little or no beard—where it does appear, carefully eradicated with tweezers; colour of the skin reddish or copper; height of the men about the average, but looking taller from their erect posture and slender figure; the women rather shorter, and more inclined to obesity, but many of them with symmetrical figure and pleasing countenance; hands and feet of both men and women small.

As before said, however, there being some hundreds of tribes among the American Indians, there are many departures from these general characteristics, not only in individuals, but entire septa. 'The Americans,' says Prichard, 'are not all of the hue denominated *red*, that is, of a copper colour; some tribes are as white as many European nations; others brown or yellow; others are black, or, at least, they are described by travellers as very much resembling in colour the negroes of Africa. Anatomists have distinguished what they have termed the American form of the human skull: they were led into this mistake by regarding the strongly marked characteristics of some particular tribes as universal. The American nations are spread over a vast space, and live in different climates, and the shape of their heads is different in different parts. Nor will any epithet derived from their habits of life apply to all the tribes of this department. The native Americans are not all hunters: there are many fishing tribes among them; some are nomadic; others cultivate the earth, and live in settled habitations; and of these, a part were agriculturists before the arrival of the Europeans; others have learned of their conquerors to till the soil, and have changed the ancient habits of their race, which, as we may hence infer, were not the necessary result of organisation or congenital and instinctive propensity.' Dr Morton's views on this subject substantially agree with those of Prichard; and both concur in adopting the test of language as a proof of one common origin for the various native tribes of both North and South America. The linguistic conclusion, now generally acquiesced in, is thus briefly stated by Mr Albert Gallatin: 'Amidst

that great diversity of American languages, considered only in reference to their vocabularies, the similarity of their structure and grammatical forms has been observed and pointed out by the American philologists. The result appears to confirm the opinions already entertained on that subject by Mr Du Ponceau, Mr Pickering, and others; and to prove that all the languages, not only of our own Indians, but of the native inhabitants of America, from the Arctic Ocean to Cape Horn, have, as far as they have been investigated, a distinct character common to all, and apparently differing from any of those of the other continents with which we are most familiar.'

The next question that comes under consideration is: Whence does it arise that, with all this similarity of physical conformation and language, there should have been only two nations among so many millions—namely, the Mexicans and Peruvians—who attained to any high degree of civilisation? When the Spaniards entered Mexico, they found in it a rich, powerful, and warlike nation, living in walled cities, in which were palaces and other sumptuous residences. They were ruled over by an emperor or king, whose sway extended over many other nations besides his own. They worshipped the sun, and had an organised hierarchy; they had also fixed laws, were acquainted with many of the arts and sciences, especially astronomy; they practised agriculture, worked mines, and displayed considerable skill in manufactures, both industrial and ornamental. The nation thus discovered was that of the Aztecs, who professed to have among them evidences of antiquity dating as far back as the year 554 of our era. A few years later, in Peru, the Spaniards found another nation, also exceedingly rich, numerous, and powerful, with a civilisation fully as much extended as that of the Aztecs, yet differing from that in many essential particulars. This was the nation of the Quichuas, frequently termed Incas and Peruvian Incas, associated with whom were the Aymaras, whose country had been subjugated by the Incas two or three centuries before the arrival of Pizarro in Peru. Each of these nations—the Mexicans and Peruvians—is supposed to have slowly developed its own civilisation during a long process of ages. In every other part of America, European settlers and explorers have found only complete or semi-barbarism. Such was the case in Virginia; such in New England, Canada, the Hudson's Bay Territory, California, and Patagonia. In Central America, however, there have been found extensive remains of architecture and other traces of civilisation, which would seem to date back to even a more remote period than that of the Mexican or Peruvian empires. Immense artificial mounds also exist in the valley of the Mississippi and elsewhere throughout America, supposed to be the work of the ancestors of the present wandering tribes. If so, there may be some truth in the theory of Dr Martius, a distinguished German ethnologist, 'that the nations of the New World are not in a state of primitive barbarism or living in the original simplicity of uncultivated nature, but that they are, on the contrary, the last remains of a people once high in the scale of civilisation and mental improvement, now almost worn out and perishing, and sunk into the lowest stage of decline and degradation.' Dr Prichard appears inclined to the same view, adding: 'Attentive observers have been struck with manifestations of greater energy and mental vigour, of more intense and deeper feeling, of a more reflective mind, of greater fortitude, and more consistent perseverance in enterprises and all pursuits, when they have compared the natives of the New World with the sensual and

volatile, and almost animalised savages who are still to be found in some quarters of the old continent. They have been equally impressed by the sullen and unsocial character, by the proud apathetic endurance, by the feeble influence of social affections, by the intensity of hatred and revenge, and the deep malice-concealing dissimulation so remarkable amid the dark solitudes of the American forests.'

Leaving this interesting discussion, let us mention that the Indians of North America have been classified by Mr Schoolcraft, one of the best authorities, as follows: 'I. Northern, extending from the Atlantic to the Pacific Ocean; II. East of the Mississippi; III. Between the Mississippi and the Rocky Mountains; IV. West of the Rocky Mountains.' These embrace altogether thirty-seven distinct families, under which, however, there are numerous subdivisions. The names of these families are: '1. Eskimaux; 2. Athapaccas; 3. Algonkins; 4. Iroquois; 5. Catawbas; 6. Cherokee; 7. Chocta, Muskog; 8. Uthees; 9. Natchez; 10. Sioux; 11. Gros Ventres; 12. Pawnees; 13. Kiaways; 14. Kaskaias; 15. Cumanches; 16. Pani, Towiacks; 17. Caddoes; 18. Adaze; 19. Chetimachies; 20. Attacapas; 21. Natchitoches; 22. Jelish; 23. Sahap-tin; 24. Waitapu; 25. Tshinook; 26. Kalapuya; 27. Jakon; 28. Luturim; 29. Sasti; 30. Pulairih; 31. Shoshonees; 32. Kituanaha; 33. Ugaliachmutzi; 34. Koulischen; 35. Naass; 36. Skidegatz; 37. Wakash.'

Again, M. d'Orbigny has classified the Indians of South America under three great groups, viz., the Andian group, the Mediterranean group, and the Brasilio-Guarani group; and these he subdivides into thirty-nine distinct nations; viz., '1. Quichua; 2. Aymara; 3. Chango; 4. Atacama; 5. Yuracares; 6. Mocetenes; 7. Tacana; 8. Maropa; 9. Apolista; 10. Araucanian; 11. Flegian; 12. Patagonian; 13. Puelche; 14. Charrua; 15. Mbocobi; 16. Mataguayo; 17. Abipones; 18. Lengua; 19. Samucu; 20. Chiquito; 21. Saraveca; 22. Otuque; 23. Curuminaca; 24. Covareca; 25. Curaves; 26. Tapiis; 27. Curucaneca; 28. Paicóneca; 29. Corabeca; 30. Moxo; 31. Chapacurua; 32. Itonama; 33. Canichana; 34. Movima; 35. Cayuvava; 36. Pacaguara; 37. Itenes; 38. Guarani; 39. Botocudo.' Other classifications have been attempted, but all more or less arbitrary. Morton is content with two grand divisions, viz., the 'Toltecan Nations' and the 'Barbarous Tribes,' the former embracing the ancient Mexicans and Peruvians, and the latter all the uncivilised or semi-civilised tribes from the extreme north to the extreme south. Of the Toltecan, whom he supposes to have been the builders of the remarkable series of mounds found throughout North America, Dr Morton collected as many as 213 skulls, taken from the oldest burial-grounds; and of the Barbarous Tribes, 211 skulls, partly modern and partly ancient. Accurate admeasurements of these, together with many curious particulars, are given in his celebrated work the *Crania Americana*.

With respect to the numbers of the Indian nations and tribes as at present existing, no perfectly accurate statistics can be given. Those in North America, however, may be fairly set down as amounting to between 5,000,000 and 6,000,000, and those in South America as reaching about 7,000,000. Of the former, only about 400,000 belong to the United States, about 110,000 to the British possessions, 40,000 to Russian America, and the rest, being the great bulk, to Central America and Mexico. Of the United States' Indians, several thousands have been reclaimed from barbarism to habits of order and civilisation, with respect to whom, Mr Schoolcraft, in a report, dated November 1854, speaks in the following hopeful

terms: 'Some twenty of the tribes have more or less fully embraced agriculture, raise large stocks of cattle, live in fixed dwellings, and have adopted the civilised costume. These occupy the new Kansas and Indian territories; four of the tribes, numbering 60,000 persons, have adopted systems of government and written constitutions. All these tribes have been transferred from the northern, middle, or southern states. No small part of them are the descendants of tribes who occupied the area of the Union on the first planting of the colonies. Much effort and much expense have been incurred with them. They have been the subject of humanitarian and benevolent care and sympathy during two centuries. To confound them in our policy with the wild tribes—for a moment to suppose that they partake of the habits and feelings of the robbers, plunderers, and murderers of the bleak plains and mountains, would be the highest injustice. There are men in these reclaimed tribes who are exalted in their feelings, principles, and manners, who acknowledge the best truths of letters, arts, and Christianity, and who live an honour to human nature.'

For more complete information with reference to the Indians of America, on the subjects here only alluded to in the most summary manner, the reader should consult the works, not only of Prichard, Latham, and Morton, but of Humboldt, Du Ponceau, D'Orbigny, Gallatin, Schoolcraft, Catlin, Pickering, Prescott, Stephens, Tschudi, and Fremont; not omitting the several reports of the United States' Commissioners of Indian affairs.

INDICTION, a period or cycle of 15 years, the origin of which is involved in obscurity. Connecting the original meaning of the word, viz., 'the imposition of a tax,' with its signification in chronology, several writers have propounded theories explanatory of its origin, none of which, however, are supported by a title of evidence. It began to be used in reckoning time, chiefly by ecclesiastical historians, during the life of Athanasius; it was afterwards adopted by the popes, who still continue to use it, and through whose influence it came to be so generally employed during the middle ages, that the dates of charters and public deeds of this era are expressed in indictions as well as in years of the Christian era. The time from which reckoning by indictions commenced, is, according to some, the 15th September 312; according to the Greeks of the Lower Empire, 1st September 312; but when this method was adopted by the popes, it was ordered to be reckoned as commencing 1st January 313. The latter, which is now alone used, is called the *Papal Indiction*. If we reckon backwards to the commencement of the Christian era, it will be seen that 1 A.D. does not correspond to the 1st, but to the 4th year of an indiction—hence, *if to any given year of the Christian era 3 be added, and the sum divided by 15, the remainder will give the position of that year in an indiction*—e. g., 1863 A.D. is the 6th year of an indiction.

INDICTMENT is the name given to the written accusation of crime against a person, and upon which he is tried by a jury. An indictment in England commences with a caption, i. e., a description of the style of the court, which, however, is no part of the indictment; then follows the venue or statement of the place where the crime was committed; next follows the accusation, which is in the name of the jurors, i. e., the grand jury. In Scotland, an indictment is also the accusation on which a prisoner is tried; but it runs in the name of the Lord Advocate, addressed to the prisoner. In England, a prisoner is not entitled, before trial, to a copy of the indictment or a list of the witnesses

against him, except in treason; but he can in most cases procure a copy of the depositions of witnesses, if these were taken before a magistrate, at a trifling expense. But many cases are not inquired into at all before a magistrate, so that this reasonable advantage is not given uniformly in England.

In Scotland, on the other hand, a prisoner is in all cases entitled to have a copy of the indictment given to him fifteen days before trial, and also a list of the witnesses to be brought against him.

INDIES. See **EAST INDIES** and **WEST INDIES**.

INDIGESTION, or **DYSPEPSIA**, is a term somewhat vaguely applied to various forms of disease of the stomach or of the small intestines in which the natural process of digesting and assimilating the food is deranged.

The symptoms of indigestion are by no means constant in all cases. There is often *anorexia* (or want of appetite), but occasionally the appetite is excessive, and even ravenous. Nausea not unfrequently comes on soon after a meal; while in other cases there is no nausea, but after the lapse of a couple of hours, the food is vomited, the vomited matters being very acid, and often bitter, from the admixture of bile. In severe cases, the vomiting has been known to occur after every meal for several months. Flatulence, relieving itself in eructations, is one of the standard symptoms of this affection, the gas that gives rise to this symptom being sometimes evolved from undigested matters in the stomach, and sometimes being apparently secreted by the walls of that viscus. It is very apt to occur in dyspeptic patients if they have fasted rather longer than usual. *Cardialgia* (popularly known as *heartburn*), *Pyrosis* (q. v.), or water-brash, and *Gastrodynia* (commonly designated *spasm* or *cramp* of the stomach, and coming on at uncertain intervals in most severe paroxysms), are other somewhat less common symptoms of indigestion.

The treatment of indigestion is more dietetic than medicinal. The quantity of food which can be dissolved by the gastric juice and intestinal fluids being limited (see **DIGESTION**), care should be taken that this quantity is not exceeded; moreover, the meals should not succeed each other too rapidly. Mr Abernethy, who was a great authority on this subject, laid great stress on the principle, that the stomach should have time to perform one task before another was imposed upon it, and he always recommended his patients to allow six hours to intervene between any two meals. With regard to the nature of the food best suited to dyspeptic persons, it may be safely asserted that a mixture of well-cooked animal and vegetable food is in general more easily digested than either kind taken exclusively. Mutton, fowls, and game are the most digestible kinds of animal food; and pork and all cured meats, such as salted beef, ham, tongue, &c., should be avoided. Raw vegetables, such as salads, cucumbers, &c., must also be prohibited. In most cases, dyspeptic persons would probably do well to avoid all stimulating drinks; but in some cases, a little cold, weak brandy and water, or a glass of old sherry, or a little bitter ale, may be taken with advantage. But upon all points of eating and drinking, a sensible patient must be mainly influenced by his own experience. The unquestionable benefit which dyspeptic patients often derive from a visit to a hydropathic establishment is due perhaps not so much to any specific action of the water, as to the well-regulated diet, the withdrawal of the mind from personal cares, and the change of scene. A six weeks' or two months' tour among the mountains of Scotland or Switzerland will in the same way often do a dyspeptic patient more good than

he could have experienced from any amount of physicking at home.

A few words must be said regarding the mode of treating the most urgent of the individual symptoms. Loss of appetite may be remedied by the employment of bitters, such as quinine, gentian, chiretta, &c., or of mineral acids, or of both combined. Nausea and vomiting may be treated with hydrocyanic acid, chloroform, and creasote in very small doses. Two or three drops of dilute hydrocyanic acid in an effervescent draught are often an effectual remedy. In intense vomiting, the amount of food taken at a time must be reduced to the lowest possible limit. A tablespoonful of milk, mixed with lime-water, will sometimes remain on the stomach after all other kinds of food have been rejected. There is no better remedy for flatulence than peppermint-water; if it fails, a drop of cajeput oil on a lump of sugar may be tried. When the eructations are attended with an odour of rotten eggs—that is to say, when sulphuretted hydrogen is evolved from the decomposition of matters in the stomach—an emetic is the best cure. The remedies for the pain in the stomach vary with the character of the pain; bismuth, nitrate of silver, and opium are often serviceable, but should not be taken without advice. A teaspoonful of the aromatic spirit of ammonia in a wine-glass of camphor mixture, often gives instantaneous relief, and if not too often resorted to, can be taken with impunity.

INDIGIRKA, a river of Siberia, in the government of Jakutsk, rises in the Yablonoi or Stavonoi Mountains, and after a northerly course, estimated at 750 miles, through a frozen desert studded with a few villages, falls into the Arctic Ocean in lat. 71° N., and long. 150° E.

INDIGO (Gr. *Indikon*, Indian), a most important vegetable dyestuff, yielding a beautiful blue and very durable dye, the basis also of the best black dye in woollen cloths. It has been used in India from a very early period, and was imported thence

Indigo Plant (*Indigo tinctoria*):
a, pod; b, block of indigo.

by the ancient Greeks and Romans, but was lost to Europe during great part of the middle ages—although the cultivation of the plant and preparation of the dye were described by Marco Polo in the 13th c.—until re-introduced by the Dutch about the middle of the 16th century. Its use in England, France, and Saxony was then for a considerable time

prevented by a strong prejudice against it, arising from the difficulty experienced in fixing the colour. Since this has been overcome, the cultivation of plants producing indigo, long confined to India, has extended to many other tropical and subtropical countries, as Egypt, the West Indies, Mexico, Brazil, &c. These plants generally belong to the genus *Indigofera*, of the natural order *Leguminosæ*, sub-order *Papilionaceæ*. The keel of the corolla is furnished on both sides with an awl-shaped spur. The species of this genus number at least 150, and are natives of almost all tropical and subtropical countries. Of these, *I. tinctoria* is the species most generally cultivated in India. It is a half-shrubby plant, 2–3 feet high, with pinnate leaves, which have five or six pair of long-obovate, dull, bluish-green leaflets, and racemes of axillary pale red flowers.

The province of Tinnevely produces a great quantity of indigo. Bengal produces, on an average, about nine millions of pounds annually. The sum which Europe annually pays for indigo is estimated at eight or ten millions of pounds sterling.

Indigo is, however, obtained from plants of other genera, particularly from *Wrightia tinctoria* (natural order *Apocynaceæ*), East Indies; *Baptisia tinctoria* (natural order *Leguminosæ*), North America, which yields indigo of a pale colour and very inferior quality; *Tephrosia tinctoria* (natural order *Leguminosæ*), Malabar; and *T. Apollinea*, Egypt and Nubia; *Marsdenia tinctoria* (natural order *Asclepiadaceæ*), in Sylhet; and *Polygonum tinctorium* and *P. Chinense* (natural order *Polygonaceæ*), China and Japan.—*Wrightia tinctoria* is a large shrub, indigenous to great part of India and to Ceylon, yielding indigo of the finest quality, and is recommended by Dr. Roxburgh for cultivation, as less dependent than the common indigo plants on rain and irrigation. It grows very freely, and throws out shoots rapidly on their being cut away.—In times when East Indian indigo was not known, or was brought to Europe only in small quantity, the same dyestuff was obtained from Woad (q. v.).—A coarse kind of indigo, called Bastard Indigo, was also at one time made in North America from the young shoots of *Amorpha cærulea*.

The Manufacture and Applications of Indigo.—The indigo plant, in its general appearance, is not unlike the lucerne of our fields. The seed is sown in drills about 18 inches apart, and soon makes its appearance above ground, when it requires incessant care to keep the weeds down, which otherwise would soon choke so tender a crop. In about two months, the plants begin to flower, and are then cut down, but soon shoot up again, and give two or three more crops in the same year. Formerly, indigo was carefully dried after being cut, and even fire-heat was sometimes used for the purpose, but now—at least in India—the practice is abandoned, and it is found in every respect better to use the plant whilst fresh and green. The first process is to place in a shallow wooden vat as much as will loosely cover the bottom of it; water is then let in so as to cover the plants about three inches, and heavy wooden frames are put on the top, to prevent them from floating. Being left in this state for from fifteen to twenty hours, fermentation is set up, and much gas disengaged, the water becoming a light-green colour. The green liquor is then run off into the second vat, which is placed below the level of the first, in which, whilst the fermentation process is being repeated upon a fresh supply in the first vat, it is violently agitated by being beaten with poles: this causes the *grain*, as it is called, to separate, and the green matter

suspended in the liquor becomes blue and granular; and this change is promoted by the addition of a little lime-water from time to time. When this operation is sufficiently advanced, the contents of the vat are allowed to settle, and in a short time the now intensely blue granular matter has sunk to the bottom, leaving the super-natant liquor almost clear as water; this is then run off nearly to the bottom, and the sediment is then run into the third vat, which is below the level of the second: here it awaits several other additions from successive operations; and a sufficient quantity being accumulated in the third vat, it is suffered to subside, and when thoroughly settled, the clear liquid is drawn off, and the granular matter is then removed, and filled into coarse bags, which are hung up to drain. When sufficiently drained, the blue paste is filled into very small boxes about three inches square, and set to dry in the sun, which soon renders it fit for packing.

This dye is, without doubt, the oldest in use; the Greeks and Romans obtained a knowledge of its uses from India, where its employment has been very general for a great length of time. Much obscurity involves indigo and its early use, in consequence of the variation in its name; for instance, the Tamools of India call the plant *Averie*, and the dye itself *Neelum*; in Sanscrit, the plant is *Vishashodanie*, and the dye *Nili* and *Nilini*, whence the *Anil* of the Portuguese. The Malays call the dye *Taroom*, and the Arabs, *Neel*.

Commercially speaking, indigo may be said to be the produce of India and Central America, as these are the only localities which supply the recognised form of the article. In India, the chief seat of the indigo manufacture, Bengal is the most important district. The total quantity received in Great Britain in 1861 was nearly 80,000 cwts.—a vast quantity, when it is borne in mind with what difficulty it is cultivated and manufactured. When pure, indigo has a rich, dark-blue colour, almost purple; it is in small cubes or parts of cubes, and its fracture shews a tendency to break up into square pieces, and indicates cracks in its substance, often filled up with a film of whitish efflorescence, probably the lime used in precipitating it. It has neither taste nor smell, and its specific gravity is about 1.50; if rubbed with any hard substance, it gives a streak with a bright coppery lustre. The varieties recognised in commerce are—1st, Bengal, which, from the care taken in its preparation, and the large scale on which it is made in that district, is the best; and its various gradations of quality, ten in number, varying from 9s. to 5s. per pound, are always kept distinct. In other sorts, they are usually much mixed. 2d, Madras and Kurpah; 3d, Oude; 4th, Manilla; 5th, Java; and 6th, South American. The last is packed in serons or cases of dried ox-skin, and its qualities are distinguished as follows: 1st, Flores; 2d, Sobres; and 3d, Cortes; all the others are in wooden chests, containing about 250 lbs. each.

Few materials are of greater importance to the dyer than indigo, and none require the exercise of more care and skill in using. Being insoluble in water, it requires the action of other solvents to render it capable of penetrating the fibres of the materials to be dyed. The method generally employed is the following: The indigo is broken into small lumps, and these are soaked in hot water, and left for at least 48 hours, in order that the moisture may soak through and soften them; after which they are put into the indigo-mill, which is a levigating machine, consisting of a vessel in which a roller is made to work by machinery, so as to rub down the indigo, mixed with plenty of water, to a very

fine paste. This is a tedious operation; therefore, in large establishments, there are usually numerous mills in the grinding-room. When sufficiently ground, the paste is removed to the dyeing-vat, where to one part of indigo is added one part of lime and three-fourths of sulphate of copper; these are well mixed with sufficient water to fill the vat, and the dyer then proceeds to dye either cotton, linen, or silk goods. See DYEING. After being dyed, the goods are dipped into a bath of diluted sulphuric or hydrochloric acid, which gives brightness and purity to the colour; they are then finished by washing in a stream of pure water, and drying.

Green indigo, called *Lo-kao*—by the Chinese, is a substance resembling indigo, which is obtained from a tree called *Hom-bi*; it is highly valued by the Chinese artists as a pigment, and also gives a beautiful permanent green colour to cotton and silk cloths; it is, however, so costly, that it never can, unless differently prepared, be used as a dyeing material. The fact that the Chinese dye cotton cloths with it, is accounted for by the nature of the process of preparing the *lo-kao*, which is this: A well-macerated decoction of the bark of the *hom-bi* tree is largely diluted with water mixed with a little lime; pieces of cotton cloth are then dipped into the vat, and taken out and exposed to the sun, which changes them to a bright green; they are then placed in perfectly clean water, and agitated until the water has removed all the free colouring matter; this water is then evaporated, and the small sediment left is the *lo-kao*. It is the cotton cloths thus used that are sold as green-dyed goods. It is said that a similar dye stuff is obtained from another tree called *Pa-bi*, and although this, as made by the natives, is much too costly to use in European dyeing, yet probably, if better means of obtaining it can be pointed out, it may become an important article of commerce.

Chemistry of Indigo.—The plants which yield indigo present no indication, when growing, that they contain any *chromogen*, or matter capable of yielding pigment, nor is it definitely known in what form the indigo exists in the vegetable tissues.

The indigo of commerce is by no means a homogeneous body. Its essential and most important constituent is *Indigotin* or *Indigo Blue*, but it likewise contains *Indigo Brown*, *Indigo Red*, and other ingredients.

Indigo Blue, or *Indigotin* ($C_{16}H_8NO_2$), is obtained from commercial indigo by extracting the ingredients with which it is mixed by acetic acid, alkalis, and boiling alcohol. It occurs either as a dark-blue amorphous powder, or in purple crystalline scales, with a metallic lustre. It is devoid of smell and taste, and is insoluble in water, alcohol, ether, dilute acids, and alkalis. When carefully heated, it may be sublimed without decomposition. Among the products of its destructive distillation are hydrocyanate and carbonate of ammonia, aniline, &c. Indigo blue dissolves without any evolution of gas in strong sulphuric acid, forming a blue solution of *sulphindigotic acid*, which is extensively used for dyeing cloth, under the name of *Saxony Blue*.

Under the action of reducing agents, such as alkaline fluids containing sulphate of iron, or a mixture of grape-sugar, alcohol, and strong soda lye, indigo blue becomes converted into *Indigo White* or *Reduced Indigo*, which forms a yellow solution in alkaline fluids, but which, on free exposure to the air, absorbs oxygen, and is reconverted into indigo blue. Indeed, this is the best method of obtaining the latter in a state of purity from commercial indigo, of which it should form about 50 per cent.

Indigo blue occurs in small quantity in the urine

of man, the horse, and the cow, and occasionally in the milk of the cow, when these fluids have been exposed for some time to the action of the air; but Schunck obtained it from the urine in so many cases (in the urine of 39 persons out of 40), that Indican (or the chromogen yielding indigo blue) must be regarded as a normal urinary constituent. See M. Schunck's paper in *The Memoirs of the Literary and Philosophical Society of Manchester*, 1857, vol. xiv., or Day's *Chemistry in its Relations to Physiology and Medicine*, 1860, pp. 310—312.

Indigo White or *Reduced Indigo*, in a state of purity, occurs in white flakes, which are devoid of taste or smell, are perfectly neutral, and are insoluble in water, but dissolve in alcohol, ether, and alkaline solutions. Its composition is represented by the formula $C_{16}H_8NO_2$, and as it only differs from indigo blue, $C_{16}H_8NO_2$, in containing one more equivalent of H, it may be considered as the hydride of the latter. If yarn or woven goods be immersed in an alkaline solution of this substance till they are thoroughly saturated, and are then exposed to the air, indigo blue is formed within the fibres of the tissue. The blue dye thus obtained is very intense and permanent. From its property of becoming blue on exposure to the air, indigo white is a sensitive test for the presence of free oxygen.

Many compounds of great chemical interest have been derived from indigo blue. It was from indigo that aniline (now so largely employed in the production of the pigments known as *mauve* and *magenta*) was first obtained.

INDO-GERMANIC LANGUAGES. See Aryan Languages.

INDORE, a Mahratta principality of Hindustan, consists of several detached tracts, some of them lying very remote from each other. With an aggregate area of 8318 square miles, and an aggregate population of about 800,000, the territory, as a whole, is traversed from east to west by the Nerbudda, and also by the Vindhya Mountains, their loftiest point within its limits being 2500 feet above the sea. The revenue is nearly a quarter of a million sterling; and the armed force amounts to about 20,000 men. Besides the capital, the chief towns are Rampura, Mehadpore, Dhi, Pitlaud, Mundlaisir, Bhanpura, and Mhow. I. is peculiarly the country of the Bheels, one of the wildest and most savage of the aboriginal tribes of India. The country, including all between its extremes, stretches in N. lat. from 21° 18' to 24° 46', and in E. long. from 74° 39' to 76° 26'. The climate is sultry, the thermometer ranging from 60° to 90° F. in the shade.

INDORE, the capital of the principality of the same name, is situated in 22° 42' N., and long. 75° 50' E., on the left bank of the Kuthi. It stands about 2000 feet above the level of the sea, and is estimated to contain 15,000 inhabitants. This place, mean and insignificant enough in itself, acquired considerable notoriety in connection with the grand revolt of 1857. Though Holkar, the rajah, remained faithful to the British government, yet his troops mutinied on 1st July, holding their prince as a prisoner in his own palace, and butchering many Europeans, men, women, and children, in cold blood. I. is of modern erection, having been founded in 1767; and its original namesake, now Jemnah, still exists on the opposite bank of the river.

INDORSED, ENDORSED, or ADDORSED, terms applied in Heraldry to two animals placed back to back. Two keys, two wings, &c., may also be indorsed, and a pelican is always drawn with his wings indorsed.

INDORSEMENT, the term generally used to denote the writing of the name of the holder on the back of a bill of exchange or promissory note, on transferring or assigning it to another. Signing the name 'A. B.' alone is a blank indorsement; and if the transferee is named, it is a special indorsement. The usual form is, 'Pay C. D. or order. (Signed) A. B.' In Scotland, it is, 'Pay the contents to C. D. or order. (Signed) A. B.' When personal liability is to be avoided, the words 'without recourse' are added. The word indorsement is also frequently used in English law, to denote any matters written or indorsed on the back of writs or deeds, as indorsements on declarations, on writs of summons, &c.

INDRA (from the Sanscrit *id*, which probably meant 'to see, to discover,' hence literally, 'he who sees or discovers,' scil., the doings of the world) is the name of one of those Hindu deities that were worshipped more especially in the Vedic period of the Hindu religion, but enjoyed a great legendary popularity also in the Epic and Purānic periods. See **INDIA**, sect. *Religion*. In that class of R'ig-Veda hymns which there is reason to look upon as the oldest portion of Vedic poetry, the character of I. is that of a mighty ruler of the bright firmament, and his principal feat is that of conquering the demon *Vṛitra*, a symbolical personification of the cloud which obstructs the clearness of the sky, and withholds the fructifying rain from the earth. In his battles with *Vṛitra*, he is therefore described as 'opening the receptacles of the waters,' as 'cleaving the cloud' with his 'far-whirling thunderbolt,' as 'casting the waters down to earth,' and 'restoring the sun to the sky.' He is, in consequence, 'the upholder of heaven, earth, and firmament,' and the god 'who has engendered the sun and the dawn.' And since the atmospherical phenomena personified in this conception are ever and ever recurring, he is 'undecaying' and 'ever youthful.' All the wonderful deeds of I., however, are performed by him merely for the benefit of the good, which in the language of the Veda means the pious men who worship him in their songs, and invigorate him with the offerings of the juice of the Soma plant. See **INDIA**, sect. *Religion*. He is therefore the 'lord of the virtuous,' and the 'discomfiter of those who neglect religious rites.' Many other epithets, which we have not space to enumerate, illustrate the same conception. It is on account of the paramount influence which the deeds of I. exercise on the material happiness of man, that this deity occupies a foremost rank in the Vedic worship, and that a greater number of invocations are addressed to him than to any other of the gods. But to understand the gradual expansion of his mythical character, and his ultimate degradation to an inferior position in the Hindu pantheon of a later period, it is necessary to bear in mind that, however much the Vedic poets call I. the protector of the pious and virtuous, he is in their songs essentially a warlike god, and gradually endowed by imagination, not only with the qualities of a mighty, but also of a self-willed king. The legends which represent him in this light seem, it is true, to belong to a later class of the R'ig-Veda hymns, but they shew that the original conception of I. excluded from his nature those ethical considerations which in time changed the pantheon of elementary gods into one of a different stamp. Whether the idea of an incarnation of the deity, which, at the Epic and Purānic periods, played so important a part in the history of Vishnu, did not exercise its influence as early as the composition of some of the Vedic hymns in honour of I., may at least be matter of doubt. He is, for instance, frequently invoked as the destroyer of cities—of

seven, of ninety-nine, even of a hundred cities—and he is not only repeatedly called the slayer of the hostile tribes which surrounded the Aryan Hindus, but some of the chiefs slain by him are enumerated by name. The commentators, of course, turn those 'robbers' and their 'chiefs' into demons, and their cities into celestial abodes; but as it is improbable that all these names should be nothing but personifications of clouds destroyed by the thunderbolt of I., it is, to say the least, questionable whether events in the early history of India may not have been associated with the deeds of I. himself, in like manner as, at the Epic period, mortal heroes were looked upon as incarnations of Vishnu, and mortal deeds transformed into exploits of this god.

The purely kingly character of I. assumes its typical shape in the *Aitareya-Brāhmana*, where his installation as lord of the inferior gods is described with much mystical detail; and from that time he continues to be the supreme lord of the minor gods, and the type of a mortal king. During the Epic and Purānic periods, where ethical conceptions of the divine powers prevail over ideas based on elementary impressions, I. ceases to enjoy the worship he had acquired at the Vedic time, and his existence is chiefly upheld by the poets, who, in their turn, however, work it out in the most fantastical detail. Of the eight guardians of the world, he is then the one who presides over the east, and he is still the god who sends rain and wields the thunderbolt; but poetry is more engrossed by the beauty of his paradise, *Svarga*, the happy abode of the inferior gods, and of those pious men who attain it after death in consequence of having, during life, properly discharged their religious duties; by the charms of his heavenly nymphs, the *Apsarasas*, who now and then descend to earth, to disturb the equanimity of austere penitents; by the musical performances of his chorists, the *Gandharvas*; by the splendour of his capital, *Amarāvati*; by the fabulous beauty of his garden, *Nandana*, &c. A remarkable trait in this legendary life of I. is the series of his conflicts with Krishna, an incarnation of Vishnu, which end, however, in his becoming reconciled with the more important god. As the god who is emphatically called the god of the hundred sacrifices (*S'atakratu*), I. is jealous of every mortal who may have the presumption of aiming at the performance of that number of sacrifices, for the accomplishment of such an intention would raise the sacrificer to a rank equal to that which he occupies. He is therefore ever at hand to disturb sacrificial acts which may expose him to the danger of having his power shared by another Indra. According to the Purānas, the reign of this god I., who is frequently also called *Sakra*, or the mighty, does not last longer than the first *Manvantara*, or mundane epoch. After each successive destruction of the world, a new I. was created, together with other gods, saints, and mortal beings. Thus, the I. of the second *Manvantara* is *Vipasc'hit*; of the third, *Susānti*; of the fourth, *S'ivi*; of the fifth, *Vālu*; of the sixth, *Manojava*; and the I. of the present age is *Purandara*. When represented in works of art, I. is generally seen riding on his elephant; and where he is painted, he is covered with eyes.

INDRĀNI, a name of the wife of the Hindu god Indra (q. v.).

INDRE, a central department of France, formed out of the western portion of the old province of Berri, lies immediately south of the department of Loir-et-Cher. Area, 2679 square miles; of which 1550 are in tillage, and 321 in pasture. Pop. 270,054. The department is well watered, the chief rivers being the Indre, the Creuse, and its tributary the

Anglin. The surface is for the most part flat, and the land is generally fertile, producing large crops of wheat and barley. The two principal resources of the department, however, are its vineyards and its flocks. The climate, except in the district of La Brenne, is mild and healthy. The principal manufactures are woollen and linen cloths, hosiery, scythes, paper, and porcelain. Iron mines are worked. The department is divided into four arrondissements—Châteauroux, Le Blanc, Issoudun, and La Châtre. The capital is Châteauroux.

INDRE, a river of France, rises on the northern border of the department of Creuse, flows north-west through the departments of Indre and Indre-et-Loire, and joins the Loire 17 miles below Tours, after a course of 136 miles, for the last 40 of which it is navigable.

INDRE-ET-LOIRE, an inland department of France, formed out of the ancient province of Touraine, lies north-west of the department of Indre. Area, 2340 square miles, of which more than one-half is arable; pop. 323,572. The department is watered by the Loire, the chief river, and by its tributaries, the Cher, the Indre, and the Vienne, all of them navigable. The Loire, to prevent inundations, which otherwise would be frequent and disastrous, is banked in by dykes throughout its course in this department. See LOIRE. In the south, the surface is hilly, and either waste or wooded, but in the other districts it is undulating or flat, and very fertile. Of the products, which include an abundant yield of the ordinary bread-stuffs, wine, of which about 14,000,000 gallons are made in ordinary years, is one of the most important. The chief manufactures are bar-iron, powder, files, woollen cloth, silk, and leather. The department is divided into the three arrondissements of Tours, Chinon, and Loches; capital, Tours.

INDUCIE LEGALES, in Scotch Law, means the number of days which a defender has to answer a summons. The term is not used in England, the phrase being 'so many days to answer, to plead, &c.'

INDUCTION of clergyman, a term used in England and Ireland to denote the investing or giving possession of a benefice to a clergyman. In England and Ireland, this is done by a mandate from the bishop to the archdeacon or corresponding official to make the induction. The inductor takes the clergyman by the hand, and lays it on the ring-key or latch of the church-door, then opens the door, and puts him into the church, and generally the church bell is tolled, to give notice to the parishioners. In Scotland, the presbytery induct the minister.

INDUCTION, the name for one of the great processes of scientific discovery and proof. It has been seen under GENERALISATION, that when we rise from particular facts to generalities, the result may take one of two forms—a general *notion*, or a general *proposition*: 'circle' is a notion; 'the circle is the line that encloses the largest space,' is a proposition. The mode of arriving at such general affirmations, truths, or laws, is what is called induction. The strict meaning of the term is 'the operation of *discovering* and *proving* general propositions;' while deduction, on the other hand, is the method of *applying* general propositions once discovered to particular cases, considered to be included within their scope. By induction we establish the law that heat expands bodies; by deduction we apply it to explain why a clock is slower in summer than in winter, owing to the changes of the length of the pendulum.

Induction is the only process of real inference—in other words, by it we proceed from the known to

the unknown; or from a limited range of facts, we affirm what will hold in an unlimited range. All things that we do not know by actual trial or ocular demonstration, we know by an inductive operation. Deduction is not real inference in this sense, since the general proposition already covers the case that we apply it to; in a proper deduction, the conclusion is more limited than the premises. By the inductive method, we obtain a conclusion much larger than the premises; we adventure into the sphere of the unknown, and pronounce upon what we have not yet seen. This operation necessarily implies a certain hazard; and it may be easily supposed that there are precautions requisite in working it. Nothing is more common than the making of bad inductions; and accordingly it is now considered a part of logic to lay down the rules for the right performance of this great operation.

A preliminary question arises—How can we ever be entitled to dogmatise beyond the sphere of our actual experience; to conclude, for instance, that five miles below the surface of the earth, there is heat enough to make water boil? The answer to this question supplies us with what is called the *ground of induction*, which is the fact, now established by the experience of centuries, *that nature is uniform*. What has happened once, will happen again, provided the same circumstances and situation of things are exactly repeated. At a former period of the world's history, there might have been doubts on this matter, and opinions were actually held that implied a want of perfect uniformity, but now those doubts are dispelled, except, perhaps, with reference to a single question—viz., the freedom of the will (see FREE WILL). Accordingly, the problem to be solved is to ascertain what is the order of nature in the instances accessible to our observation.

The uniformity of nature is a compound of many separate uniformities. In other words, there are different departments or classes of phenomena, each determined by separate laws. Thus, we have mathematical, physical, chemical, physiological laws, the statement of which severally constitutes the subject-matter of each of these sciences. Now, a distinction is observable, which is of some importance as regards the method of inductive investigation. Some of the phenomena thus conjoined under uniform principles are properties *simultaneously* existing, as the properties of mathematical figures; others are *successions*, and affirm order in time, the most important of all which is that peculiar succession denominated cause and effect. See CAUSE. The problem of inductive inquiry is in a great measure occupied with this one department, although there are also inductions respecting contemporaneous or conjoined properties. Natural history is in part made up of affirmations of simultaneous properties, as, for example, the anatomical structure of animals, and in part of affirmations of cause and effect, as in all the operations that sustain life, and determine reproduction, growth, and death.

Respecting the whole of the phenomena implied under Causation, the principle of nature's uniformity is embodied in one great and comprehensive statement, called the law of causation; the import of which is, that whatever begins to exist is uniformly preceded by something else, to which it invariably succeeds. Events do not arise of themselves, or out of nothing; and although there is such a thing as Plurality of Causes, everything that arises is preceded by some other thing as a cause, and always follows when that cause occurs; there being supposed no counteracting agency. The aim of the scientific inquirer, then, is to single out from the mass of circumstances that have accompanied and preceded any event, some one or more that invariably

precede the occurrence of that event, which being found, are thenceforth known as its cause. This has to be accomplished by a process technically called *elimination*, by which is understood a series of operations intended to separate everything that is indifferent to the production of the phenomenon, until we arrive at some one thing or more that cannot be removed without making the effect to cease.

Mr John Stuart Mill, in his *Logic*, has illustrated in detail the methods to be adopted for making sure that we have singled out the true causative circumstance from among the many that may precede a given effect. They resolve themselves mainly into two. 'One is, by comparing together different instances in which the phenomenon occurs. The other is, by comparing instances in which the phenomenon does occur, with instances in *other respects similar* in which it does not. These two methods may be respectively denominated the Method of Agreement, and the Method of Difference.'

The Method of Agreement supposes that we make it a study to *vary the circumstances* under which the supposed phenomenon is produced. Either by observation of cases presented in nature, or by artificially contriving new cases, in other words, by experiment, we do our utmost to obtain the effect in a great many different connections, whereby we ascertain what things are indifferent to it. Whatever circumstance can be excluded, the phenomenon still happening, or can be absent notwithstanding its presence, is not connected with it in the way of causation. The accidental or indifferent circumstances being thus eliminated, if only one remains, that is the cause; if the elimination does not go so far, but leaves three or four circumstances or agents, we can only say that the cause is among them. Mr Mill enunciates the Method of Agreement in a formal canon, or rule of induction, to the following effect: *If two or more instances of the phenomenon under investigation have only one circumstance in common, the circumstance in which alone all the instances agree is the cause (or effect) of the given phenomenon.*

If we could always obtain the requisite variety of circumstances for the exclusion of all indifferent adjuncts, this method would fully answer the ends of inductive inquiry. But this is not always to be had, and even when practicable, the operation is often very laborious. When the other method (Difference) can be applied, the desired end is reached by a shorter route. If, instead of excluding the indifferent agencies one by one, we can contrive an experiment, or make an observation, that excludes *one* agency or circumstance, followed by the cessation of the effect, we conclude at once that what has thus been left out is the cause, or an essential condition or part of the cause. Whenever we are so fortunate as to light upon two instances suited to this method, we establish causation at once and beyond all question. The *experimentum crucis* of Bacon was something of this nature; only it supposed that a question lay between two alternative or competing agencies, which an experiment had been hit upon for deciding; such an experiment behaved to be one of Difference. This method is embodied in the following canon: *If an instance in which the phenomenon under investigation occurs, and an instance in which it does not occur, have every circumstance, except one, in common, that one occurring only in the former, the circumstance in which alone the two instances differ is the effect, or cause, or a necessary part of the cause, of the phenomenon.*

These are the two leading methods, but there are certain cases met by a procedure somewhat different. Sometimes we have a phenomenon made up of causes

partly known and partly unknown. It is then possible to subduct the effects due to the known causes, and what remains will be attributed to the remaining agencies. This is expressed by Mr Mill in the following rule or canon: *Subduct from any phenomenon such part as is known by previous induction to be the effect of certain antecedents, and the residue of the phenomenon is the effect of the remaining antecedents.* The more our knowledge is extended, the more able are we to proceed upon this method, termed the Method of Residues. 'It is by this process, in fact,' says Sir John Herschel, 'that science in its present advanced state is chiefly promoted.'

There remains a class of laws wherein the application of any of those three methods is rendered impracticable, from the circumstance, that the agency in their case is irremovable and indestructible, so that we cannot obtain any cases where it is entirely absent. Such an agent is heat, which can never be entirely separated from any body, so as to ascertain, by comparing cases of its presence with those of its absence, what effects are due to it. So we can never get out of the sphere of the earth's attraction. The difficulty hence arising is surmounted by observing the *variations of degree* of the cause, and whether there be a corresponding variation in the degree of the effect. Thus, we infer that heat is the cause of the expansion of bodies, and that its total absence would lead to their maximum condensation and consolidation, by watching the effects of any additions or subtractions of a body's temperature. Solids, liquids, and gases (with certain limited and special exceptions) are found expanding steadily as they are heated, and contracting as they are cooled; and this is to us a sufficient justification for considering that the law in question holds good. This process is termed by Mr Mill the Method of Concomitant Variations, and is expressed by him in the following terms: *Whatever phenomenon varies in any manner whenever another phenomenon varies in some particular manner, is either a cause or an effect of that phenomenon, or is connected with it through some fact of causation.*

There are many problems growing out of the applications of induction to the great variety of natural phenomena, the main principles being nevertheless the same. An important extension of the means of scientific discovery and proof arises after a certain number of general laws have been discovered, and when phenomena can be shewn to be results of the operation of one or more of such laws. Thus, the great induction of universal gravity was applied *deductively* to explain a great many facts besides those that enabled the induction to be made. Not merely the motions of the planets about the sun, and the satellites about the planets, but the remote and previously unexplained phenomena of the tides, the precession of the equinoxes, &c., were found to be inferences from the general principle. This mode of determining causes is called the Deductive Method. When several agents unite in a compound effect, there is required a process of calculation to find from the effects of the causes acting separately the combined effect due to their concurrent action, as when the path of a projectile is deduced from the laws of gravity and of projectile force. It is the deductive stage of science that enables mathematical calculation to be brought into play with such remarkable success as is seen in astronomy, mechanics, &c. See DEDUCTION.

The circumstance that phenomena may result from a concurrence of causes, leads to the distinction between ultimate laws and derivative or subordinate laws. Thus, gravity is an ultimate law; the movement of the planets in ellipses is but a subordinate

law. These inferior laws may be perfectly true within their own limits, but not necessarily beyond certain limits, of time, place, and circumstance. A different adjustment of the two forces that determine a planet's motion, would cause a circular or a parabolic orbit; and therefore it is, that when phenomena result from a combination of ultimate laws acting under a certain arrangement, they are not to be generalised beyond the sphere where that arrangement holds. These inferior laws are sometimes mere inductions that have not been resolved into their constituent laws, and then they go under the name of 'Empirical Laws.' Thus, in the hands of Kepler, the elliptic orbit of the planets was only an empirical generalisation, ascertained by the Method of Agreement; Newton converted it into a derivative law, when he shewed that it resulted from the more general laws of gravity, &c. The earlier stages of induction present us with many of those empirical laws; in some subjects—as physiology, medicine, &c.—the greater number of inductions are of this character. The cure of disease is especially an example of this: hardly any medicine can have its efficacy traced to ultimate laws of the human system. Hence the uncertainty attending the application of remedies to new cases, and also the want of success that often attends them in circumstances where we think they ought to succeed.

Induction applies to other laws than those of causation—namely, to uniformities of co-existence. For the illustration of these, as well as the other parts of induction, see Mill's *Logic*, book iv.

INDUCTION OF ELECTRIC CURRENTS.

The discovery of the power of electric currents to induce currents in neighbouring conducting circuits is due to Faraday. His researches on the subject, named by him *volta-electric induction*, were published in the *Philosophical Transactions* (1831—1832). Henry (1832) observed that when contact was broken in a long galvanic circuit a bright spark occurred, which did not occur when the circuit was short. This was shewn by Faraday (1834) to be due to the extra current induced by the various parts of the circuit in each other. Bachhoffner and Sturgeon (1837) shewed the superior action, in induction apparatus, of a bundle of iron wires to that of a solid bar of iron. Henry (1841) studied the inductive action of induced currents of different orders. De la Rive designed, in 1843, an electro-chemical condenser, consisting of a primary coil, which, by means of the extra current, could enable a single galvanic cell to decompose water. The same decomposition, however, had been effected by Wright in 1840. Ruhmkorff constructed (1850 or 1851) the first so-called *induction coil*, the excellence of which was chiefly attained by the proper insulation of the secondary coil. Fizeau (1853) increased immensely the power of the coil, by providing it with a condenser. Of late years, coils of great power have been constructed, rivalling, if not exceeding, the most powerful electric machines in length and power of spark.

The *fundamental law* of current induction may be thus shewn. Two long copper wires, *pp* (fig. 1) and *ss*, are fixed so as to be parallel and close to each other. The extremities of the one, *pp*, are in connection with the poles of a galvanic battery, *E*, and those of the other, *ss*, with the binding-screws of a galvanometer, *G*. The instant the circuit of the battery is completed, and the current sent along *pp*, a current in the opposite direction is induced in the wire *ss*, which is shewn by the deflection of the needle of the galvanometer. This induced current is only momentary, for though the current continues to circulate in *pp*, the needle

soon falls back to its original position of rest, and the wire *ss* gives free passage to other currents, and appears to be in no way affected. If, now, when

Fig. 1.

the needle is at rest, the battery circuit be broken, and the current in *pp* stopped, another momentary current is indicated by the galvanometer needle, but in this case in the same direction as the inducing current. The inducing wire and current are called *primary*, and are so distinguished from the induced wire and current, which are termed *secondary*. The passive condition of the wire while thus under induction has been described by Faraday as electro-tonic. An electric throb, so to speak, marks the setting in of this state, and another its vanishing; the former in the opposite direction to that of the inducing current, and the latter in the same direction. If the primary wire, *pp*, be movable, so that it can be suddenly brought near to, and withdrawn from the secondary, *ss*, while the battery current passes steadily, currents are induced as in the former case, the approach of the wire being marked by an inverse current, and its withdrawal by a direct one. As long, however, as the primary wire remains in any one position, all evidence of electricity in the secondary wire disappears; but if in this position the strength of the primary current should be increased or diminished, momentary currents in the secondary wire would again mark the changes in the primary, the increase causing an inverse, and the decrease a direct current. Hence we conclude, that a current which begins, a current which approaches, or a current which increases in strength, induces an inverse momentary current in a neighbouring conducting circuit, and that a current which stops, a current which retires, or a current which decreases in strength, induces a direct momentary current in a neighbouring circuit. For inverse, the word *negative*, and for direct, the word *positive*, are frequently employed in reference to induced currents.

In experiments like the above, it is much more convenient to wind the primary and secondary wires side by side round a bobbin, so as to form a coil, as in fig. 2. The wires are insulated from each other by a covering of wool or silk. Not only does such a disposition admit of very long wires being used, but it also disposes the wires employed to greater advantage, for each single turn of the primary wire acts not only on the corresponding turn of the secondary wire, but on all the turns near it. The inductive effect of such a coil is much greater than that which would be obtained by the same extent of wires running side by side in a straight or crooked line. It is not even necessary that the two wires

Fig. 2.

be wound round together, each may be wound on a separate bobbin, and the one placed inside the other, as in fig. 3. The primary coil, P, here

Fig. 3.

represented, is made of wire $\frac{1}{16}$ th of an inch in diameter, covered with wool; and the secondary coil, S, of silk-covered wire, about $\frac{1}{32}$ th of an inch, and much longer than the primary wire. With two such coils, the illustration of the preceding principles of induction can be conveniently given. If the primary coil be placed in the circuit of a galvanic cell, by two loose and flexible wires, so as to allow of its easy motion, and if the terminal binding-screws of the secondary coil be placed in connection with a galvanometer, when P is inserted into S, a momentary inverse current is indicated, and when it is removed, a momentary direct one; or if, when P remains in S, the strength of the primary current be altered, the needle announces the induction of currents according to the principles stated above. In order, however, to obtain the greatest effect from the secondary coil S, it is necessary, whilst P remains within it, to have some means of continuously completing and breaking the primary current. A contrivance for this purpose is called a *rheotom*, or *current-break*. A simple rheotom may be made of a common file, by holding one wire from the battery against the end of the file, and running the other along the teeth, the current being stopped each time the wire leaves a tooth. In this way, a rapid series of interruptions is effected, each of which is attended by an inverse and a direct current in the secondary wire. A break of the same description, but more constant, may be also made by causing a metal spring to press against the teeth of a metal wheel, both spring and wheel being connected with the battery. As the wheel is turned by a handle, the spring breaks the contact each time it slips from one tooth to another. The most convenient form of break, however, is one which is made self-acting by the action of an electro-magnet, which receives the name of a *magnetic hammer*.

Quantity and Tension of Induced Currents.—Let us place the coil P within S; let P, along with a self-acting rheotom, be put in the circuit of a galvanic cell, and let S be connected with a galvanometer. The interruption in the primary current being effected by the rheotom with great rapidity, the induced inverse and direct currents are sent with corresponding rapidity through the coil of the galvanometer. If this last be of a short and thick wire, so as not to tax the tension of the current transmitted, the induced currents will not deflect the needle; or if they should happen, through the unsteady action of the break, to do so, it only

oscillates round its position of rest. This proves that the quantity of electricity transmitted by the induced inverse and direct currents is the same, for they each exert the same influence on the needles. But if the coil of the galvanometer consist of a long fine wire, the needle is kept deviated in a direction which argues the action of the direct current. This leads us to conclude, that both currents, though equal in quantity, are unequal in tension, the direct current having the highest tension, for it has more power to force its way through the fine wire of the galvanometer than the inverse. Other proofs of the same principles may be easily furnished.

The difference of the tension of the two induced currents is accounted for in this way: when a change takes place in the primary current, the quantity of the electricity induced by it in the secondary wire is the same whether this change takes place quickly or slowly; the tension, however, is very different. When the change takes place slowly, the total quantity of electricity in circulation continues to pass as slowly, and there is little in motion at one time; but when the same occurs quickly, it is sent with momentum, so to speak, and the quantity in circulation at one time is as much greater, in comparison with the former case, as the time is shorter. It is this quick dispatch of electricity which constitutes the tension of the current. Now, as it takes some time before the primary current is fully established, the inverse induced current is slow and of low tension; but when the contact is broken, the primary current ceases much more suddenly than it began, and the direct induced current is quick and of high tension. This view of the matter is borne out by experiment, for it is found, that whatever favours the suddenness of the changes of the primary current, heightens the tension of the currents induced by these changes. The break, from this circumstance, forms an important element in the construction of all induction apparatus.

The inductive power of the primary coil is immensely increased by placing a bundle of soft iron rods or wires in the centre of it. The magnetism which begins and ceases in these at each passage of the current acts in conjunction with the inducing force of the coil. The centre of the bobbin P (fig. 3) is hollow, to receive a bundle of this kind. The greater part of the inductive action is due to the iron core, and the induced currents got with and without it are not to be compared in point of energy. A solid bar of soft iron may also be used, but with much less advantage, for the induced currents which linger in it after the stoppage of the main current, acting themselves inductively, impair the suddenness with which the current disappears from the primary wire and magnetism from the core. The thin layer of oxide which forms on the rods insulates them sufficiently from one another, and prevents the formation of such currents. It is partly for the same reason that metal tubes cannot be used for bobbins for either primary or secondary coils. If such were used, closed circuits would be formed in them, the reaction of which would prolong the changes of the primary inducers, and consequently impair the tension of the secondary current. Metal bobbins would not be open to this objection if they had a longitudinal slit, which would make the transverse section a broken ring and circuit.

The excitation of magnetism in the core is the principal aim of the primary coil, and as a strong current is essential to that object, it is made of thick wire and of moderate length. In the secondary coil, the tension of the induced current alone is aimed at, and with this view it is made of as thin wire as can be made, so as to admit of as many

INDUCTION OF ELECTRIC CURRENTS.

turns as possible being brought within the influence of the core and primary coil. The electric conformation of the secondary coil is sometimes looked upon in the same light as that of a galvanic battery. The total electro-motive force of the coil is the sum of that of all the turns in it, in the same way that the electro-motive force of the battery is proportionate to the number of cells.

Extra Current.—Not only does a galvanic current induce electricity in a neighbouring circuit, but it also acts inductively on itself. When contact is broken in a battery circuit, the galvanic spark is seen. See GALVANISM. When the wire is short, the spark is feeble, but it increases in brilliancy with the length of the circuit, and this becomes particularly observable when the wire is wound round in a coil. This certainly does not arise from the current being strong with the long wire, and weak with the short one, for quite the reverse is the case, as might be shewn with the aid of a galvanometer. The real cause of the superior brilliancy of the galvanic spark with the long circuit is to be found in the induction of the primary current on the various parts of itself, exciting, as they are called, *extra currents* in the primary wire. It has been fully attested by experiment, that at the instant a *galvanic current begins and ends, extra currents are induced by the action of the several parts of its circuit upon each other, that at the beginning of the current being inverse, and that at the end direct.* As the extra current inverse acts opposite to the main current, it does not appear as a separate current, but only retards the instantaneous passage of the main current. The extra current direct succeeds the main current, and has consequently a separate existence. It is what is generally referred to when the extra current is spoken of. This extra current is of much higher tension than the original current. The effect of the extra current on the direct induced current of the secondary coil is to lessen very decidedly its tension. If a way be made for the extra current, the tension of the induced current falls prodigiously. In a large coil-machine, which gives freely sparks of one or two inches in length, when the two portions of the break are joined by a thin wire, so as to allow the extra current to pass, sparks will not travel between the two poles, however near they are brought. When no such communication exists, a portion of the extra current leaps over between the separating parts of the break, and in so far diminishes the intensity of the secondary current. The condenser of the coil-machine, to be afterwards described, has for its object the absorption or suppression of the extra current, but the manner in which it effects this is not yet properly explained. The prejudicial effect of the extra current on the induced current is easily understood, when we bear in mind that it prolongs the cessation of the magnetism of the core and of the current in the primary coil, and thus impairing the suddenness of this change, reduces the tension of the induced current.

Induction Coil.—The essential parts of this apparatus have been already described in detail. A primary coil with its core of iron wire, and a secondary coil exterior to, and insulated from a primary coil, form the main portion of the instrument. The primary coil is connected with the poles of a galvanic battery, and in the circuit, a rheotom is introduced, to effect the interruptions of the current essential to its inductive action. The only parts not yet referred to are the condenser and the commutator. The condenser consists of several sheets of tinfoil and oiled silk, laid alternately the one above the other. The first, third, fifth, &c. sheets of tinfoil are connected by strips of the same material; so are the second, fourth, and sixth, &c.; the

whole forming a condensing apparatus like a Leyden jar, the odd sheets forming the one coating, and the even sheets the other. Each set of sheets is connected with one of the wires of the primary coil. The condenser is generally placed in the sole of the instrument, and does not meet the eye. The commutator consists of an ivory cylinder covered with conducting plates on two sides, and is so constructed that it can break contact, or transmit the current through the coil in either direction.

An induction coil, as constructed by Ladd of London, is represented in fig. 4. The forms under which the instrument appears are very various, and the one in the figure only serves to shew the general

Fig. 4.

requirements in its construction. The two binding-screws, *p* and *n*, are for the battery-wires; *C* is the commutator. The two coils, *W*, lie horizontally on the sole of the instrument, *S*. The secondary coil alone is seen, the primary being within it and out of view. The breaking hammer, being behind the coil, is likewise not shewn. The condenser is contained by the box which constitutes the sole, and a conducting connection is established between its coatings and the wires of the primary coil. The terminations of the secondary coil are fixed to the heads of the glass pillars, *P*, *P'*, which are furnished with pointed rods capable of universal motion. The excellence of the instrument depends on the proper insulation of the secondary coil. The bobbin must be made of glass, gutta-percha, or (best of all) vulcanite, so as to prevent the induced electricity from reaching the ground by the primary coil. Care must also be taken to insulate the different parts of the secondary coil from each other. If this were not done, the spark which completes the secondary current, instead of taking place at the rods, the place at which it is wanted, would pass within the coil itself. It is necessary, in consequence, to have each layer of the coil insulated from the other, by interposing gutta-percha paper, and cementing it with a hot iron to the sides of the bobbin. The induced current must thus pass through all the turns of the wire, and is prevented from shortening its course by leaping over one or more layers of the coil.

Experiments with the Induction Coil.—Say that we experiment with a coil like the one shewn in fig. 4, about one foot long and nearly six inches in diameter, which yields readily sparks of from four to five inches with a battery of six Bunsen cells. After connecting the battery-wires, and setting the commutator so as to complete the contact, let us place the movable rods within an inch of each other. An uninterrupted rush of sparks is transmitted between the points of the rods. The sparks are not the clear single sparks of the electric machine, but seem to be made up of several sparks occurring at the same instant, which are white and crooked. These are enveloped in a luminous haze, which, on closer examination, wears the appearance of a congregation of the spiral sparks, the

convolutions of which are in constant rotation. This hazy spark can be blown away by the breath, and separated from the white spark which cannot be so removed. As the rods are withdrawn from each other, it disappears, and when they stand above three inches apart, the spark resembles in every respect the forked single spark of a powerful electric machine. When the points are withdrawn beyond striking distance, electric brushes still play between them, which become visible in a darkened room. If the hand be brought near the rod connected with the exterior end of the coil, sharp stinging sparks, two or three inches in length, are got. The rod connected with the inner end does not yield them so readily, and this is the same whether it be the positive or negative pole. When a gold-leaf electroscope is brought near, the leaves part energetically from each other; and when a spark is received by it from one of the rods, it remains permanently charged. When, however, the knob of the electroscope is brought into actual contact with either of the rods, this action ceases, because the induced currents, inverse and direct, neutralise each other. When the knob touches, both currents affect the leaves equally; but when it is at some distance, the direct current alone has tension enough to act. Each pole of the induction coil is the seat of two opposite electricities, alternating with each other, alike in quantity, but differing in tension, and this accounts for the resemblances and differences between the coil and machine electricities. When the poles are put in connection with the coatings of a Leyden jar, the sparks passing between the points are much more brilliant, and the sharp snap of the simple spark grows into a loud report. The Leyden jar effects a condensation of the electricity of each direct current, and each spark discharge takes place in shorter time, and consequently with greater intensity. The condensed spark punctures paper and the like with great facility, but it is of very low heating power. The uncondensed spark, more particularly the hazy spark, got when the poles are near each other, kindles paper, gunpowder, coal-gas, and other combustibles with readiness and certainty. It is from this property of its spark that the induction coil is of so great use in mining operations. The two ends of the wires coming from the coil are fixed near each other without touching, and are imbedded in a charge of gunpowder at a safe distance from the operator. The wires are insulated by gutta-percha, and when the induced current is sent through them, sparks pass through the gunpowder between the ends of the wires, and set fire to it. When several charges have to be ignited simultaneously, the spark of the coil-machine is considered much more reliable than the action of a powerful galvanic battery in heating thin wires connecting the ends of the battery-wires. See GALVANISM. The power of the direct induced current of even large induction coils to deflect the magnetic needle, and to effect chemical decomposition, is very insignificant. This shews that it is very much inferior to the inducing current in quantity, however much it may be superior in tension. The physiological effect, on the other hand, is tremendous, and the experimenter must take care not to allow any part of his body to form the medium of communication between the poles, as the shock so got might be dangerous, if not fatal.

When the induced current is made to pass through nearly vacuum spaces, a very splendid effect is produced. The *Electric Egg* (fig. 5) is employed to display this. It consists of a glass vessel in the shape of an egg, with an open neck above, and another below. Brass fittings are attached to these.

The lower opening is fitted with a stop-cock, and can be screwed to the plate of an air-pump. A brass rod and ball rise a short way into the egg. The fittings above are intended to allow of a rod ending in a ball passing up and down air-tight, so that the two balls can be conveniently set at different distances. When the egg is exhausted, and the wires from the coil are attached, the one above, and the other below, a luminous glow extends between the balls, which is wide in the middle, and contracts at either extremity. When the exhaustion has reached one-twelfth of an inch, as shewn by the gauge of the air-pump, black bands are seen to lie horizontally in the light, so as to wear the appearance of stratification, as shewn in the figure. These occur more readily when a drop or two of turpentine, alcohol, or other have been introduced into the egg. The cause of the stratification is as yet a matter of speculation. The ball which forms the negative pole is enveloped in a covering of blue light. The glow, which is of a beautiful mauve tint, appears to proceed from the positive ball, and reaches nearly to the negative ball, from which it is separated by a well marked non-luminous space. By means of the commutator, these appearances at the balls can be instantly transposed. Serving the same purpose as the electric egg, there is a great variety of vacuum tubes hermetically sealed and ready for use at any time. These have been first filled with particular gases, and then exhausted, and they exhibit lights of various tints, according to the gas contained by them.

Fig. 5.

These have been first filled with particular gases, and then exhausted, and they exhibit lights of various tints, according to the gas contained by them.

INDULGENCE, in Roman Catholic theology, means a remission, by church authority, to a repentant sinner, of the *temporal* punishment which, in the Catholic theory, remains due after the sin and its eternal punishment have been remitted. A doctrine which has been the subject of so much angry controversy, and which may be regarded as the chief among the proximate causes of the Reformation, deserves very careful consideration. We must confine ourselves, however, to a brief authentic explanation of the doctrine such as it is held by Roman Catholics, together with a history of the practice in the various ages of the church.

By the discipline of the first centuries, a severe course of penitential observance was exacted of all who fell into any grievous crime, especially apostasy, murder, and adultery, such sinners being excluded from church communion for various periods, in some cases even till the hour of death. These penitential observances, which Protestants regard as purely disciplinary, were designed, according to the Catholic view, as an expiation, on the part of the penitent, for the *temporal* punishment which, after sin and the *eternal* punishment due to it have been remitted by God, still remains to be undergone; and some of the most acrimonious of the early controversies, the Montanist and the Novatian, arose as to the power of the church to relax these penitential observances, and to admit grievous sinners to communion. These ancient relaxations (of which they regard that referred to in 1 Cor. v. 5 and in 2 Cor. ii. 10 as a type) are considered by Catholics as examples of the modern indulgence; and the practice which grew up in the 3d and 4th centuries, and which even then

was carried to great extremes, of granting such relaxations on the recommendation of martyrs or confessors, is held by Catholic theologians to be an illustration of that principle of vicarious atonement, according to which, in the theory of indulgences, the church is supposed to supply, from the inexhaustible treasure of the merits of Christ, and of the 'supererogatory' works of the saints, what may be wanting to the completeness of the atonement of the less perfect but yet truly penitent sinner to whom she grants the indulgence. That this practice of relaxation, whatever may have been its real import, was to be used according to the judgment of the bishop as to the disposition of the penitent, is expressly laid down by the council of Ancyra in 308, and by that of Nice in 325. In all cases, however, the person granting the relaxation was to impose certain good works as a partial substitute for the penalty which had been relaxed; and among these works, which had at first been purely personal, came by degrees to be included money payments for certain religious or charitable objects, as the building of a church, or the foundation of a monastery or hospital. The name indulgence appears to have originated late, the first recorded instance of its use being by Alexander II. in the 11th c.; but the institution itself is found in full development during the wars of the Crusades, the serving, or the contributing to service in which, 'provided it were for devotion alone, and not from motives of greed or of glory,' was accepted in the council of Clermont 'as an equivalent substitute for all penance.' Such an indulgence was called 'plenary'; where a portion only of the penitential works was relaxed, it was called 'partial'; and in order to put a bar to their excessive multiplication and to other abuses, Innocent III. declared the power of granting 'plenary indulgences' to be reserved to the pope alone, bishops being only authorised to grant the 'partial' or limited indulgences described above. The fourth Lateran council condemns the 'indiscreet and superfluous' granting of indulgences; and among the abuses which grew up in the church during the western schism, one of the most remarkable was the lavish dispensation of indulgences, in the granting of which the contending popes rivalled each other in prodigality. The last extreme, however, was not reached until the beginning of the 16th c., when, with a view to raising the funds necessary for the erection of the great church of St Peter's at Rome, the pope, Leo X., published a plenary indulgence, the principal condition for the gaining of which was a contribution to this work. Catholic historians contend that in itself such a condition was perfectly justifiable, and that if duly explained to the people, it might be lawfully and even meritoriously complied with; but they admit that many of the preachers of the indulgence, in extolling its natural effects, went to indefensible extremes, and that, even making the fullest allowance for exaggeration, it cannot be denied that grievous abuses both of doctrine and of practice were committed in Germany and in Switzerland. Hence the decree of the council of Trent, while it affirms that the use of indulgences, as being 'most salutary for the Christian people, and approved by the authority of councils, is to be retained in the church,' yet orders that, 'in granting them, moderation be observed, lest, by excessive facility, discipline may be enervated.' Upon the special instructions of this council, all the modern legislation on the subject of indulgences has been founded; but as the decree of the council does not explicitly declare what is the precise effect of an indulgence, it is further explained by Pope Pius VI., in his celebrated bull, *Auctorem Fidei*, that an indulgence, received with due dispositions, remits not alone the

canonical penance attached to certain crimes in this life, but also the temporal punishment which would await the penitent after death to be endured by him in purgatory.

From the above explanation, it will be gathered that Catholics do not understand by an indulgence a remission of sin, much less a permission to commit sin, or a promise of forgiveness of future sin. They contend, moreover, that since the benefit of an indulgence can only be enjoyed by a sinner who has repented of sin, and resolved to embrace a new life, the imputation of introducing laxity of principle and easy self-indulgence is entirely unwarranted. And although, for the most part, the good works which are required as the condition of obtaining indulgences may appear easy and even trivial, yet the one indispensable preliminary—sorrow for sin and sincere purpose of amendment—in itself involves the very highest effort of Christian virtue.

On the subject of indulgences, Protestants are accustomed to quote the language used by popes in granting them, in opposition to the views put forth by Roman Catholics in defending them. And nothing is more common than for popes in their bulls of jubilee, to grant *the most plenary and complete indulgence, pardon, and remission of all sins*, on certain conditions specified. And although this grant is made only to 'the faithful who are truly penitent and have confessed,' yet being limited to a certain period, as the year of jubilee, and to certain conditions, as saying certain prayers, visiting certain churches, wearing or kissing a scapular, or the like, it is argued that these cannot but acquire, in the estimation of the people, an importance which is very unfavourable to penitence, virtue, faith, and piety. It is likewise urged that the whole doctrine of indulgences is founded not only on an unwarranted assumption of power given to the church, but also on a doctrine of human works and merits inconsistent with what we are taught in Scripture as to the office of Christ as a Saviour.

INDUS (Sansc. *Sindhu*, probably from a root signifying 'to flow'), the great river that bounds Hindustan on the west. It rises in Tibet, near the sources of the kindred Sutlej, in lat. 31° 20' N., and long. 81° 30' E. The precise spot is said to be 18,000 feet above the level of the sea, and to be on the north side of the Kailas, a Himalayan peak which overtops it by at least 4000 feet. Its general course, till it forces its way between the Himalaya Proper and the Hindu Kush, is towards the north-west, being pretty nearly at right angles to its general direction through the plains. On reaching Sussi (near the borders of Budakshan), its most northern point, it turns southward, loses itself in the hills, and reappears at Takot in Kohistan, north of the Punjab. After a run of 870 miles, having still 940 miles before it, it becomes navigable at a point which, on other grounds also, is worthy of notice. Here it receives the Cabul, its principal affluent on the right; and here is Atak (Attock), anciently Taxila, the scene of Alexander the Great's passage. About half way from Atak to its mouth, it receives, on the left, the accumulated waters of the Punjab through the single channel of the Punjnd. Each of the 'five water-courses,' as well as the Cabul, is practicable for inland craft to the mountains. Below its confluence with the Punjnd, the I., instead of increasing in volume, becomes gradually less. Its basin is here narrow, so that the affluents are insignificant, while its arid sandy nature causes the river to suffer from absorption and evaporation. This operates still more powerfully from the circumstance, that the river here divides into numerous channels, many of which never return at all to the main stream, while others return much

shrunk in volume. This wasting of the waters is, however, not very apparent to the eye, owing to the gradual slackening of the current and the ascent of the tides. At Migani, eight miles north of Hyderabad, commences the Delta Proper, which measures 75 miles upwards, by 130 along the coast of the Arabian Sea. The area of the drainage—its extreme dimensions being respectively 900 miles and 750—has perhaps been over-estimated at 488,000 square miles, fully four times the extent of Great Britain and Ireland.

The value of the I. as a route of traffic is less than that of most other streams of equal magnitude. In the winter, one only of its numerous outlets is at all available for communication with the sea; and even after the melting of the spring snows, there is no passage anywhere for an ordinary sea-going vessel of more than 50 tons. Still, in another respect the river is favourable for navigation, as the fall from Atak to the sea is only 1000 feet in 940 miles.

The I. abounds with fish of excellent quality, and is infested by crocodiles. The alluvium brought down by the stream has been calculated to be sufficient for an annual formation 42 miles long, 27 miles broad, and 40 feet deep. Near Rori, a short distance below the first point of divergence, both the main stream and one of its offsets pass through a ridge of limestone, which must at one time have turned the descending floods laterally into what is now a desert, but bearing the plainest traces of former cultivation.

INDUSIAL LIMESTONE, a singular variety of fresh-water limestone, found in Auvergne. It is formed of the cases or indusia of caddis-worms, great heaps of which have been encrusted with carbonate of lime, and formed into a hard travertine. Several beds occur, some as much as six feet thick, each cubic inch of which contains as many as ten or twelve cases. See **CADDICE**. The Auvergne cases are formed of the shells of a minute Paludina, so small that 100 shells may be counted in a single indusium.

INDUSTRIAL ACCESSION, a phrase borrowed by the Scotch from the Roman law to denote the increased value given to a thing by labour and skill being exercised upon it. This phrase includes the case of a person building by mistake on another's land, in which case, in England, though the building was done *bonâ fide*, it belongs absolutely to the owner of the land, who is not bound even to pay for the materials, which he can keep, or their value; but in Scotland, the owner of the land, though entitled to the materials, would be liable to pay for their value.

INDUSTRIAL FRUITS, in Scotch Law, the produce of land which the life-renter is entitled to; called in English law, Emblements (q. v.).

INDUSTRIAL SCHOOLS. This term is used very variously, sometimes being synonymous with ragged schools, in which mechanical arts are taught; sometimes designating ordinary elementary schools, in which agricultural or some other industrial art is taught to the boys during one portion of the school-day, or in which sewing, cooking, washing, and ironing are taught to the girls. In England, Scotland, and Ireland, attempts have been made to attach practical instruction in agriculture to elementary schools for boys, but with very small success, except in the last-named country; there the Glasnevin Agricultural Training School has accomplished much good. See **AGRICULTURAL EDUCATION**. Nor can it be said that the attempt to attach other industrial arts to national and parochial schools has been attended with better results. The Privy Council on Education gave special grants for many

years to schools which combined industrial with literary instruction, but these grants are not continued in the Revised Code. In elementary schools for girls, industrial work, to the extent of sewing, shaping, knitting, and netting, has been almost universally introduced, and forms one of the most important and interesting features of female primary education in Great Britain; but the attempt to connect with these subjects instruction in cooking, washing, and ironing, has been tried as yet only to a limited extent, and has been only partially successful. In ragged schools, on the other hand, no department of the school-work seems to thrive better, partly because it enters so largely into the scheme of instruction, partly because the children are removed from the control of parents, and left solely to the management of the school committee; for the great obstacle in the way of connecting industrial arts with ordinary schools is the unwillingness of parents to see their children engaged in manual occupations during the time which ought, in their opinion, to be devoted solely to intellectual training and the acquisition of literary knowledge. The ragged schools to which we have just referred are recognised by the legislature as 'industrial schools,' and may be defined as schools in which the pupils are fed and clothed (wholly or partially), as well as taught the elements of an ordinary education, and the practice of some trade. By a statute passed in 1861, children under 14 found vagrant or begging, or convicted of petty offences, may be sent by a magistrate to an industrial school that has been certified by the Home Secretary. Parents also, on paying for board and lodging a small sum, may place their children in industrial schools if they can show that they are unable to control them. The Treasury may contribute to the maintenance of these schools on the representation of the Home Secretary. If a child abscond from the school before he is 15, the justices may send him back, or place him in a Reformatory School (q. v.). In 1861, there were in England 23, and in Scotland 16 industrial schools, and the number of pupils attending was respectively 1574 in the former, and 1606 in the latter.

INDUSTRIAL SOCIETIES are societies which carry on some trade, the profits of which are applied to an object of mutual benefit, resembling the object of Friendly Societies (q. v.). A statute was passed in 1862 (25 and 26 Vict. c. 87), to regulate these societies on improved principles, the first statute having been passed in 1852. By the latest statute, all industrial societies then in existence were entitled to be registered, free of expense, by the registrar of friendly societies. Any number of persons not less than seven may establish such a society, for the purpose of carrying on any labour, trade, or handicraft, whether wholesale or retail, except the working of mines and quarries, and except the business of banking, and of applying the profits for any purposes allowed by the Friendly Societies' Acts. The rules of the society must define the object, name, and place of office of the society, and it must in all cases be registered as one of limited liability. The rules must also state the terms of admission of members, holding of meetings, voting, transferability of shares, audit of accounts, investment of capital, mode of withdrawing from society, claims of executors, application of profits, and appointment and remuneration of managers and officers. A copy of the rules must be delivered to every person who demands them, on payment of one shilling. No member's interest is to exceed £200. The name of the society is to be painted conspicuously on the outside of the office, and put on all bills of exchange, bills of parcels, invoices, receipts, and letters of credit, and a penalty is incurred for neglecting these

requirements. These societies are placed on the same footing as friendly societies in respect of the exemption from stamp duties and income-tax—of settlement of disputes by arbitration or justices of the peace—of compensation to members unjustly excluded—of the power of justices or the county courts in case of fraud, and of the jurisdiction of the registrar. Any member may nominate any person into whose name his interest in the society at his decease shall be transferred, but the society has the option of paying to such nominee the full value of his interest. The society may be wound up like a joint-stock company by the county court of the district, and in the event of its being wound up, past and present members are liable to contribute to the assets to an amount sufficient to pay the debts; but no past member is bound to contribute who has ceased for a year to be a member, or where the debt was contracted after he left the society, or unless the existing members are unable to satisfy the contributions necessary to pay the debts; and no member is liable to pay more than the amount, if any, unpaid on the shares in respect of which he is liable as a past or present member. Every person or member having an interest in the funds is entitled to inspect the books and the names of the members at all reasonable hours at the office of the society. A general statement of the funds of the society, shewing the assets and liabilities, must be sent to the registrar once every year, and every member and depositor is entitled to demand and receive without payment a copy of such statement from the treasurer or secretary. The registrar of friendly societies in his Report (1862) says the late statute of 1862 is defective in some particulars, and a new one will be shortly required, but the substance of the law will doubtless remain as above stated.

INERTIA (Lat. 'inactivity'), a term expressive of that indifference to a state of rest or motion which is a universal property of matter, and may be expressed by saying that *a body in motion will continue in motion, and a body at rest will remain at rest, unless acted upon by some external force*. The latter part of this principle was known to the ancients, and by them attributed to a certain repugnance to motion, which was a characteristic of all matter; but it was shewn by Galileo that the former part was equally true and general. This property of matter has been called by Kepler *vis inertiae*.

INESCUTCHEON, in Heraldry, a single shield borne as a charge. When there are two or more, they are simply called escutcheons, for an inescutcheon, it is said, must always occupy the fess point of the shield. An inescutcheon is to be distinguished from an escutcheon of pretence, which is not a charge, but a separate coat.

INFALLIBILITY, in Controversial Theology, means the immunity from error, in all that regards faith and morals, which is claimed by the Roman Catholic Church, and, at least as regards the past, by the Greek Church, as represented in the decrees of the councils which that church looks upon as ecumenical. The latter claim, however, which does not go beyond that of *inerrancy*, or actual exemption from error up to the present time, differs widely from that of infallibility, as put forward by the Roman Church, which involves not alone an actual historical immunity from error, but also such a positive and abiding assistance of the Spirit of God as will at all times both protect against the possibility of error, and guide and direct in the faithful teaching of all necessary truth. The infallibility claimed by the Roman Church is thus of two kinds, *passive and active*—the first (Matt.

xvi. 18), in virtue of which the church never can receive or embrace any erroneous doctrine, no matter by whom proposed; the second, in virtue of which she is charged with the function (Matt. xxviii. 19; Mark xvi. 15; Ephes. iv. 11—16) of permanently *teaching* to the world the essential truths of God, of actively resisting every access of error, and of authoritatively deciding every controversy by which the oneness of belief among the faithful may be endangered. Catholics regard this gift as a natural and necessary accompaniment of the authority in matters of faith with which they believe the church to be invested, and which, if not guided in its exercise by such infallible assistance, would be but a false light, and an attractive but dangerous instrument of delusion.

Such is the notion of infallibility as claimed by the Roman Church. Two very important and practical questions, however, arise regarding it, both of which have been the occasion of much controversy even among Catholics themselves; viz., as to the *subject*, that is, the seat or the organ of this infallibility, and as to the *object*, that is, the matters to which it extends.

As to the first, all Catholics are agreed in believing that the body of bishops, morally speaking, throughout the church, acting in common with the pope, constitute the most perfect organ of the infallibility of the church; and hence, that when they unite in any way, whether as assembled in a general council or by any joint action, though separated in place, their judgment is infallible. Thus, if a doctrinal decree be addressed officially by the pope to the whole church, and be either expressly confirmed or tacitly accepted by the bishops, this decree is held to be infallible. In like manner, if a doctrinal decree, emanating in the first instance even from a local council, as that of a national or even a provincial church, should be universally accepted by the pope and the bishops, that decree also is held to be infallible. In a word, wherever there is found the *united* judgment of the pope and the bishops, all agree in accepting it as the infallible judgment of the church. But should the pope alone judge without the bishops, then arises the well known dispute of the Gallican and ultramontane divines; the latter affirming, the former denying, the papal judgment to be infallible. See PAPACY. It will be enough to say here that all alike are agreed in holding, whatever may be their several opinions as to the objective infallibility of the separate papal judgment, that it cannot be, at all events, binding as an *article of Catholic faith*, so long as it shall not have received the assent of the body of the bishops.

On the matters or subjects to which the gift of infallibility extends, Catholics are agreed in one principle, that it embraces all those subjects, and those only, which are necessary for the maintenance of divine truth in the church. Hence, presupposing divine revelation, either written or oral, it embraces all questions of faith and morality, all subjects of general discipline, so far at least as to preclude the introduction, by authority of the church, of any discipline which should be injurious to faith or to morality. On the other hand, it does not embrace questions of science, or matters of fact, or abstract opinions unconnected with religion. On this point, all Catholics have been agreed. But a very celebrated dispute arose in the 17th c., on occasion of the *Augustinus* of Jansenius, as to the infallibility of the church in judging of books, out of which originated the well-known Jansenist distinction of *law* and of *fact*. See JANSENISM. On this subject, it will be enough to say, that all Catholics are now agreed in recognising as a

necessary condition to the effective infallibility, that it should extend to the judgments upon books so far as to decide whether the doctrine contained therein may or may not be opposed to sound faith or morality.

The arguments in favour of the infallibility of the church, which Roman Catholics derive from texts of Scripture, are set aside by Protestants on the ground that these texts only teach the permanence of the church and the continuance of God's grace towards it (as Matt. xvi. 18; Matt. xxviii. 19, 20; &c.), and have no relation whatever to the special subject of infallibility.—It is common also for Protestants to urge, that on the supposition of infallibility and of the need of an infallible interpreter of Scripture, as commonly declared by Roman Catholics, there can be no value in any argument from Scripture; and that the Roman Catholic theologian, in attempting to prove the infallibility of the church by Scripture, and the authority of Scripture by the infallibility of the church, is involved in the sophism of reasoning in a circle.—It is sometimes added, that if God's word needs an interpreter to make it a safe rule of faith, man's word may well be supposed equally difficult to comprehend.—And the notion of infallibility, with the whole system of which it forms an essential part, is protested against as contrary to the rational nature of man, and to that personal relation and responsibility to God which are at the foundation of all true religion.—Something is also made, in argument, of the difficulty which the advocates of the infallibility of the church have found in agreeing as to where it is lodged.

INFAMED, or DEFAMED, in Heraldry, an epithet applied to a lion or other animal which has lost its tail, the loss being supposed to disgrace or defame it. *Defamed looking backwards* occurs in ancient blazon for counter-rampant regardant, the lion being supposed to be flying from an enemy.

INFAMOUS. Infamy was, in point of law, formerly a ground for rejecting a witness in a court of justice; but now, in the United Kingdom, the witness is allowed to give evidence subject to comment, and to state what he can say for what it is worth.

INFAMOUS BEHAVIOUR, DISCHARGE WITH INFAMY, terms in use in the military and naval codes to designate conduct (and its penalty) which is not only opposed to discipline, but is also disgraceful in a social sense. As infamous behaviour, have been always classed in all countries desertion of colours on the field of battle, failure to attempt to succour comrades in danger, cold-blooded cruelty, and other crimes which are greatly subversive of morality. If a man is found guilty of any of these crimes by a court-martial, and not sentenced to death, the sentence is ordinarily discharge—or dismissal—with ignominy or infamy. So severe an enactment adds to the force of the penalty, and stigmatises the offender for life as a disgrace to his country and his cloth.

INFANT, in English Law, means every male and female under the age of 21. As a general rule, an infant cannot enter into contracts; at all events, they are not binding except at his or her option. But a contract for necessities is always binding, and an infant may be imprisoned for non-payment of these, like other persons. The father, or, after his death, the mother, of an infant can in general only be bound for an infant's debts where some express or implied contract to pay for these can be made out; and the mere fact of the infant living in the same house is not always sufficient to imply liability,

though it is generally an element for the jury. If an infant enter into trade, he is nevertheless only bound by his contracts at his option. But in all cases, if the infant, on coming of age, ratify the contract, then it is binding on him.

An infant in England generally requires the consent of his parent or guardian to marry, though it is more correct to say, that if he misrepresents in the preliminary formalities that he is of age, he may be indicted for perjury, but nevertheless the marriage will be good, and cannot be annulled. An infant cannot make a will either of his real or personal estate. He can only sue in a court of law by a near friend or *prochein ami*, who is his father if alive, or any other friend.

In Scotland, the law differs in many respects from the law of England on this subject. The term infant is not used at all in a technical sense. All persons, if male, are in legal strictness called pupils till 14, and if female, till 12; and from 14 or 12 to 21, they are technically called *minors*. In general, the contracts of a pupil are absolutely void, and he is under the care of tutors, who are either his parents, or others appointed by the court. A minor, on the other hand, may enter into contracts, but if they are to his lesion or prejudice, he can reduce or set them aside any time within four years after majority. Moreover, if a minor go into trade, his contracts bind him, as they do other persons. Further, a minor can make a will or testament, operating on his movable estate, though he cannot alienate his heritable estate in like manner. The four years which are allowed to him after majority to consider whether he will set aside contracts are called *quadrimum utile*; and if he can prove lesion, he is in that period entitled to restitution. In Scotland, also, a minor may marry as freely as if he were a major, and, indeed, he is in general his own master, or *sui juris*, at the age of 14 (as a female is at the age of 12); whereas in England he would be liable to have a guardian appointed to control his person till he attained 21.

INFANT SCHOOLS. Oberlin (q. v.), the pastor of Waldbach, in France, may be regarded as the founder of infant schools. He appointed females in his own parish to assemble the little children between the ages of two and six, his object being to interest them by conversation, pictures, and maps, and to teach them to read and to sew. The first infant school attempted in this country was in connection with Robert Owen's socialistic establishment in Scotland; it was taught by James Buchanan. In 1819, through the efforts of Lord Brougham and Lord Lansdowne, an infant school was set on foot in London. One of the first teachers was Wilderspin, whose labours in connection with the extension of infant schools are well known. His methods, based on the Pestalozzian system, were further matured by the Home and Colonial Infant School Society, founded in 1836. This society, by training teachers and instituting model infant and juvenile schools, has done more than any other to propagate the infant school system.

Infant schools are not yet very numerous either north or south of the Tweed; but they have certainly been more extensively encouraged in the southern than in the northern half of the kingdom. Two causes have operated to prevent their more rapid increase—the want of means, it being necessary to devote to juvenile schools the money which can be collected for educational objects; and the defects which have hung about the system, and brought it into disrepute. Too much has frequently been attempted in the way of direct instruction. In Germany, under the names of *Kleinkinderschulen* and *Kindergärten*, infant schools are numerous. In

France, under the name of 'Asylums,' they are very widespread.

Infant schools, like other seminaries which are not purely *professional* in their aims, ought to keep in view the threefold nature of the child's mind, and appeal to its different faculties in turn. But while the intellect, the moral nature, and the imagination ought to receive their proper food, it has to be borne in mind that we contradict the laws of nature when we omit an element more powerful and exacting than any of these; we mean the physical, and that love of play, fun, and nonsense which is connected with it, and which is peculiar to infancy, and not unbecoming even the gravity of manhood. By marching, exercises, toys, and, above all, by the judicious use of a large open playground, full provision should be made for the muscular restlessness of children, and for their love of play. The room in which they are collected should be little more than a well-ordered, covered playground. In the playground, whether open or covered, order, obedience, kindness, consideration, civility, cleanliness, good-temper, are to be taught, and the *moral* objects of the infant school attained. Play, and the moral training which may be connected with it, should be the leading ideas of the place, and to these everything else should be subordinated. Next to this, the intellectual nature of the infant has to be considered, its future anticipated, and the elements of reading taught, but with the help of such methods and books as call for the minimum of mental exertion. An infant school which has cultivated the moral nature of its children through games and exercises, and has taught them to read easy monosyllabic sentences by the time they reach the age of six, has accomplished its work well. At the same time, other means of awakening interest and intelligence may be resorted to with advantage, but under this restriction, that, if they fail to call forth spontaneous and unconscious attention, either through the want of skill on the part of the mistress to present them in an attractive form, or through some defect in the apparatus at the command of the mistress, they should at once be given up. We refer to songs of a moral or narrative kind—rhymes and nursery jingles—descriptions of objects and pictures by the children under the teacher's guidance (object-lessons)—the concealed purpose being to cultivate the perceptive faculties of form, colour, number, size, &c.—and lessons in arithmetic on a ball-frame. Then, again, the teacher may collect the children around her and read to them fairy tales and simple stories of incident and the affections. All this may be, and actually is attained; but the qualifications in the teacher for the attainment of them are rarely to be met with. So far as these qualifications are of a moral or imaginative kind, they are natural endowments; but they may receive enlightenment and direction by a judicious system of training. In the first Report of the Home and Colonial School Society, it is truly said, 'that few situations in life require so much discretion, so much energy, so much tenderness, so much self-control and love, as that of a teacher of babes.' Without a consciousness that she possesses these qualifications, especially the last-named, no woman should for a moment contemplate the career of an infant-school mistress.

The question still remains to be considered—whether infant schools are desirable at all, and whether the family hearth, and the fields, or the streets, do not constitute the best, because nature's infant school. Were society in a normal and healthy condition, the answer to this question would be, that infant schools are hurtful even at the best,

and that, when we bear in mind the chances of their being badly conducted, they may be generally denounced as a public nuisance. But we are *not* in a normal state; and while infant schools proper are, perhaps, superfluous in rural parishes, they are in populous places a boon and a blessing, if not a necessity.

INFANTE (from the Lat. *infans*, an infant), the title given in Spain and Portugal to the princes of the royal family, the corresponding title of INFANTA being given to the princesses. Since the 14th c., however, the heir-apparent to the throne in Spain has been styled the Prince of Asturias, and the heir-apparent in Portugal, until the separation of Brazil from the mother-country, bore the title of Prince of Brazil. The personal domain of an Infante or Infanta is called the *Infantado*, and this has come to be the name of a district which was made a dukedom in 1475.

INFANTICIDE, the act or practice of murdering infants, which is abhorrent to modern civilisation, was common in ancient times, and now prevails among many barbarous nations. It prevailed in Greece and Rome, and (such is the force of custom) found defenders in Plato and Aristotle! The latter, in his *Politics*, says the law should forbid the nurturing of the maimed, and where a check to population is required, abortion should be produced before the quickening of the infant. In Sparta, we are informed that the law directed, when a child was born, the father was to carry it to an appointed place, to be inspected by the elders of the community. If they perceived that its limbs were straight, and its look was wholesome, they returned it to its parents to be educated; otherwise, it was thrown into a deep cavern, at the foot of the mountain Taygetus; and it was said this law had a wholesome effect, for it made women with child very careful as to their eating, drinking, and exercise, and hence they proved excellent nurses. In the other Grecian republics, a similar disregard of the life of sickly infants was shewn. With regard to the practice among the Romans, little definite information exists, though learned authors discuss it at great length. It seems certain that it lay with the Roman father to say whether his child should be permitted to live or not. The exposition of infants, indeed, was the rule, rather than the exception, in most countries in old times. Among the Norse, the child's life always hung in the balance till the father handed it to the nurse to be reared; if, on account of its being weak, or a daughter, he disapproved of its living, it was exposed to die by wild beasts or the weather. In modern times, the practice is cruelly common among certain peoples. Child-murder prevails to a great extent throughout the whole of the South Sea Islands. Among the Fijians, it is a system. A recent authority says, that in Vanua Levu in some parts, 'the extent of infanticide reaches nearer two-thirds than a half.' Among the Hindus, the practice of destroying children, especially females, prevailed frightfully, till it was checked in the time of the Marquis of Wellesley's rule. The Rajpûts, it is said, destroy all female children but the first-born—a peculiar custom, due to its being a point of honour with a Rajpût to nearly ruin himself in the marriage feast and portion of his daughter, so that he could not afford to have more than one. The Mohammedans were inclined to the same practice, but effected their object chiefly by means of abortion. In New Holland, the native women think nothing of destroying, by compression, the infant in the womb, to avoid the trouble of rearing it alive. In China, infanticide

is supposed to be common, the chief cause being said to be the right of periodically repudiating their wives, which is possessed by Chinamen. Some statistics, recently published in the *Esperance* of Nancy, indicate the fearful extent to which life is lost through this practice prevailing in so vast a population as that of China. In all the cases above cited, it may be assumed there was no feeling of infanticide being wrong or criminal. In some, it was owing to religious feeling of a perverted kind; in some, to the difficulty of living; but in many, as among the Fijians, it would appear that the mother killed her child often from whim, anger, or indolence.

Modern civilisation deals very differently with the subject of infanticide, for one of its maxims is that human life, from its first to its last hour, is sacred, and whoever wilfully puts an end to it is a murderer, or a criminal of the same category. Instead of encouraging the destruction of life, modern civilisation abounds in every kind of machinery for preserving it, however unsuccessful the attempt. The chief cause which now leads to infanticide is that of shame, which, however, operates only in the case of the child being illegitimate. The parents often incur the risk of committing the crime of murder, to avoid social disgrace. In order, therefore, to appreciate the force of the checks put by the law on the tendency to infanticide, the law of Bastardy (q. v.), the practice of instituting Foundling Hospitals (q. v.), and the kind and degree of the punishments attending any attempt more or less direct to destroy the child either before or after birth, require to be taken into account.

The criminal law deals with the cognate offences which make up infanticide in the following manner, whether the child is legitimate or illegitimate. As regards the procuring of abortion, every woman who takes poison or other noxious thing, or uses instruments or other means to procure her miscarriage, is guilty of felony, and liable to penal servitude for life, or not less than three years; and so is any person who administers poison or uses instruments upon the woman with such intent. Whoever supplies drugs, poison, or instruments for the same purpose, is guilty of a misdemeanour, and liable to penal servitude for three years. The concealment of birth is also made a criminal offence. Whoever, after a child is born, by any secret disposition of the body, endeavours to conceal its birth, is guilty of a misdemeanour, and liable to imprisonment for two years. This is the offence which, perhaps, is most frequently committed, or at least made the subject of prosecution in such cases, as the attempt to establish the larger crime of murder to the satisfaction of a jury, is frequently foiled by the secret sympathy shewn towards the mother, who is presumed to have been the victim of seduction, or otherwise wronged. The existence of this offence shews the necessity which every woman likely to become a mother labours under of making public her situation to some extent. As the destruction of children may be effected by the negative fact of not supplying food and clothing, as well as by the positive act of wounding or ill-treating, the refusal or neglect of a parent or other person who is bound by law to supply food and clothing to the child, and neglects to do so, thereby causing its death, amounts either to murder or manslaughter, according to the circumstances. Moreover, the unlawful abandoning or exposure of any child under the age of two years, whereby the life and health of the child are endangered, is a misdemeanour punishable with three years' penal servitude. Where a person is charged with the murder of a very young child, it is essential to prove that the child was in life. The test of this is not that it breathed, or had an inde-

pendent circulation after it was separated from the mother, but it is enough that the child was fully born; hence, if a man strike a woman with child, so as to cause the death of the child, he is neither guilty of murder nor of manslaughter of the child. The judges of England, in 1848, had to deliberately consider whether though a child was still attached to the navel-string, the killing of it was murder, and they held that it was. In all cases of the murder of infants, the question whether the child was fully-born, and so the subject of murder, is generally one of medical jurisprudence, upon which medical skill is needed to throw light, and medical men have certain well-known tests for ascertaining this important fact. The above offences in reference to infanticide are punished in a similar manner in Scotland.

One of the coroners in London recently stated that an inquest is held daily upon the bodies of children destroyed through the design, the neglect, the ignorance, or the mental infirmity of the mothers. Even when the act may fairly be regarded as a crime, its enormity is generally greatly lessened in the eye of the law by the consideration of the physical condition and moral disturbance of the parent. Where puerperal insanity supervenes, the infant is often sacrificed during the despair or violence of the mother; but even where there is no motive discoverable, no delusion, no explanation afforded, no outraged feeling or fury, there has been observed a morbid disposition to kill the newly born. This disposition is observed in certain of the lower animals; it has appeared epidemically. After the murder perpetrated by C. Cornier, five similar atrocities were noticed. (Rev. J. Cave Browne, *Indian Infanticide*, 1857.)

INFANTRY, the foot-soldiers of an army. Among semi-barbarous nations, fighting on foot has always been considered less advantageous than fighting on horseback or in chariots; but as war has become a science, the principal strength of armies is found to lie in their infantry. See **ARMIES**, **TACTICS**, **WAR**, &c.

INFECTION is distinguished from Contagion (q. v.) by some medical writers, who would restrict the latter word to the cases in which there must be contact of the healthy person with a patient, while they apply the term *infectious* to diseases which can be conveyed by the atmosphere. The distinction is unimportant.

INFECTIOUS DISORDERS in cattle have been made the subject of special enactment, in order to protect the public from the calamities arising from the spread of disease in so important an article of food. Though passed for a temporary period, the act 11 and 12 Vict. c. 107, has been continued from time to time, and will probably be ultimately declared permanent. The statute gives power to the police to seize any sheep or lambs exposed in any market which are infected or labouring under a disease called the sheep-pox, or *variola ovina*. The parties who so expose them are liable to penalties, and the cattle may be destroyed; so if any person depasture diseased sheep on commons, woods, forests, waste lands, open fields, or the roadside.

INFETMENT, or **SASINE**, a Scotch law-term, used to denote the symbolical giving possession of land, which was the completion of the title, the mere conveyance not being enough. The instrument of sasine was the notarial instrument embodying the fact of infetment. But now the necessity of a separate formality is unnecessary, it being sufficient to register a conveyance in the register of sasines in Scotland. In England, there is no similar register

for deeds, and the title is complete when the conveyance is executed and delivered to the purchaser. In Scotland, an *infefment in security* is a temporary infefment to secure payment of some debt; and an *infefment of relief* is a similar security to relieve a cautioner.

INFINITE. This word is the source of much controversy and difference of opinion. Some hold that there corresponds to Infinity a distinct notion, which we are entitled to entertain and reason about, with the same confidence that we discuss measured intervals, as a yard or mile; while others maintain that the word is a name for a mere negative. Sir W. Hamilton goes so far as to say that 'the Infinite and the Absolute are only the names for two counter-imbecilities of the human mind, transmuted into properties of the nature of things—of two subjective negatives converted into objective affirmatives' (*Discussions*, p. 21). And Mr J. S. Mill holds a similar view. It had also been maintained by Locke that we have no positive idea of the infinite, that it was only the negative of an end or termination (*Essay on the Understanding*, book ii. chap. 17).

The notion of the infinite has, indeed, been admitted into mathematical reasoning, a circumstance that would seem to imply that we could use it with exactness, and, consequently, it could not be altogether an incompetence or imbecility of the understanding. It appears, however, that mathematicians use the word under peculiar restrictions. They employ it in the two extremes of the infinitely great and the infinitely little. 'If we see a conclusion, which we can nearly attain by the use of a large magnitude, more nearly by the use of a larger, and so on without limit, that is to say, as nearly as we please, if we may use a magnitude as large as we please, but which is never absolutely attained by any magnitude however great, then such conclusion may be said, for abbreviation, to be absolutely true when the magnitude is infinite' (*Penny Cyc.*, art. 'Infinite'). The very same statement might be made regarding the infinitely small, which is represented in mathematics by the symbol for nothing, although it is not the same as nothing in the strictest sense, namely, the nothing caused by subtracting a quantity from itself, as two from two. It is nothing in this sense, that if added to a finite quantity, as 10, it produces no augmentation that can be made use of; the quantity for all purposes remains the same. The machinery of infinite quantities plays a large part in the operations of the higher mathematics, and is introduced in order to compare two things naturally incommensurate. Thus, in estimating the area of a curved surface, such as a circle, in straight-lined spaces, such as square inches, the difficulty was got over by a sort of fiction, namely, by supposing the circle to be inscribed by a right-lined figure or polygon, of such a very great number of sides that they coincide to all intents and purposes with the curved circumference. The coincidence can never be perfect; but by imagining the sides to be smaller and smaller, and, consequently, more and more numerous, the difference between the polygon and the circle may become less than any assignable quantity, or, as it may be said, infinitely little, in fact, as good as nothing, so that the estimate of the area of the one will stand for the estimate of the area of the other. This device for overcoming the natural incommensurability of straight and curved, and of number and motion, is the real occasion of the mathematical use of the term in question. Nor does it give any foundation for the view that would regard the infinite as a positive conception of the mind, which we may apply to objects with a conscious meaning.
